THE WASHINGTON FARMER

SUCCESSOR TO
THE RANCH PACIFIC DAIRYMAN HORN AND HOOF

VOL. XL. JANUARY 4, 1917. ** NO. 1.

Work Stock---Can the Farm Raise Its Own?

Many Farmers Say Yes; Many Say No; but All Agree It Is a Problem to Be Faced

BELIEVING the work horse problem to be one of increasing concern to the farming industry, The Farmer some time ago sent out a list of questions to representative farmers throughout the northwest with a view to helping solve the problem. Beginning with the accompanying article The Farmer will publish portions of the many replies received, certain of the arguments made and deductions that may be drawn from them.

"I raise colts every year. If I figure feed and pasture, I can just as cheaply buy them, but I raise plenty of feed and find it a good and profitable way to turn feed into money."—D. van der Griend, Lynden, Wash.

"It stands as a proverb in the Kuna country that all work on the farm should be done by brood mares and geldings under five years old. In a proper ratio, the brood mare will produce larger returns than any other animal on the farm in southern Idaho."—D. R. Hubbard, Kuna, Idaho.

"In canvassing the country over you will find the farmers most prosperous where they keep a few good brood mares, raise a few colts and have a team to turn off every year or two. This beats digging into their pockets to buy a new team every few years."—A. C. Ruby, Gresham, Oregon.

It costs an average of $115 to raise a colt to four years old on the farms of the northwest. Sixty-five per cent of the farmers raise their own work horses. Thirty-five per cent buy at least two-thirds of the horses that make up their farm teams.

At 5 years old, 1400 weight, a team like this costs from $350 to $500. Is it practicable to raise them on the farm? Is it practicable not to?

The above figures are arrived at by averaging a large number of estimates and calculations given by farmers of the four northwestern states in reply to a series of questions sent to them by The Farmer some time ago.

The series of questions were based on a desire to learn whether a work horse can be raised on the average farm as cheaply as he can be bought, and if not, why not? A great variety of opinion was expressed by those replying, but in the main there was a uniformity on vital points. Among the questions asked were the following:

(1) What proportion of farmers in your vicinity buy their work horses at an age ready for work, and what proportion raise them from colts by mares on the farm? (The replies indicated that approximately two-thirds raise their own, one-third buying).

(2) From your own personal experience and observation, do you believe that a farmer can buy a four-year-old horse more cheaply than he can raise him? (Of the replies, one out of every four said he could be bought as cheaply as raised).

(3) Who, if anybody, can raise a colt more cheaply than the farmer? (Nearly all agreed that nobody could, except where there was open range.)

$200.00 Dangling in Front of You!

Grab It! And Your Winning It Does Not Depend on Either Skill or Luck, but on Accuracy and Patience **Grab It!**

They're Coming!

Answers to Figure Problem Pouring In and Old and New Subscribers grab the Special Subscription Offer of This Paper

3 Years for $1.50

BEGIN ADDING RIGHT NOW AND SEND IN YOUR TOTAL

Don't Guess Add 'Em Up!

"7000!" writes some one, just like that, but the Contest Editor is inclined to think that "Some One" is guessing.

Remember, this is not a guessing contest. The winner is sure to be a subscriber who has carefully footed up the total of the figures in the chart.

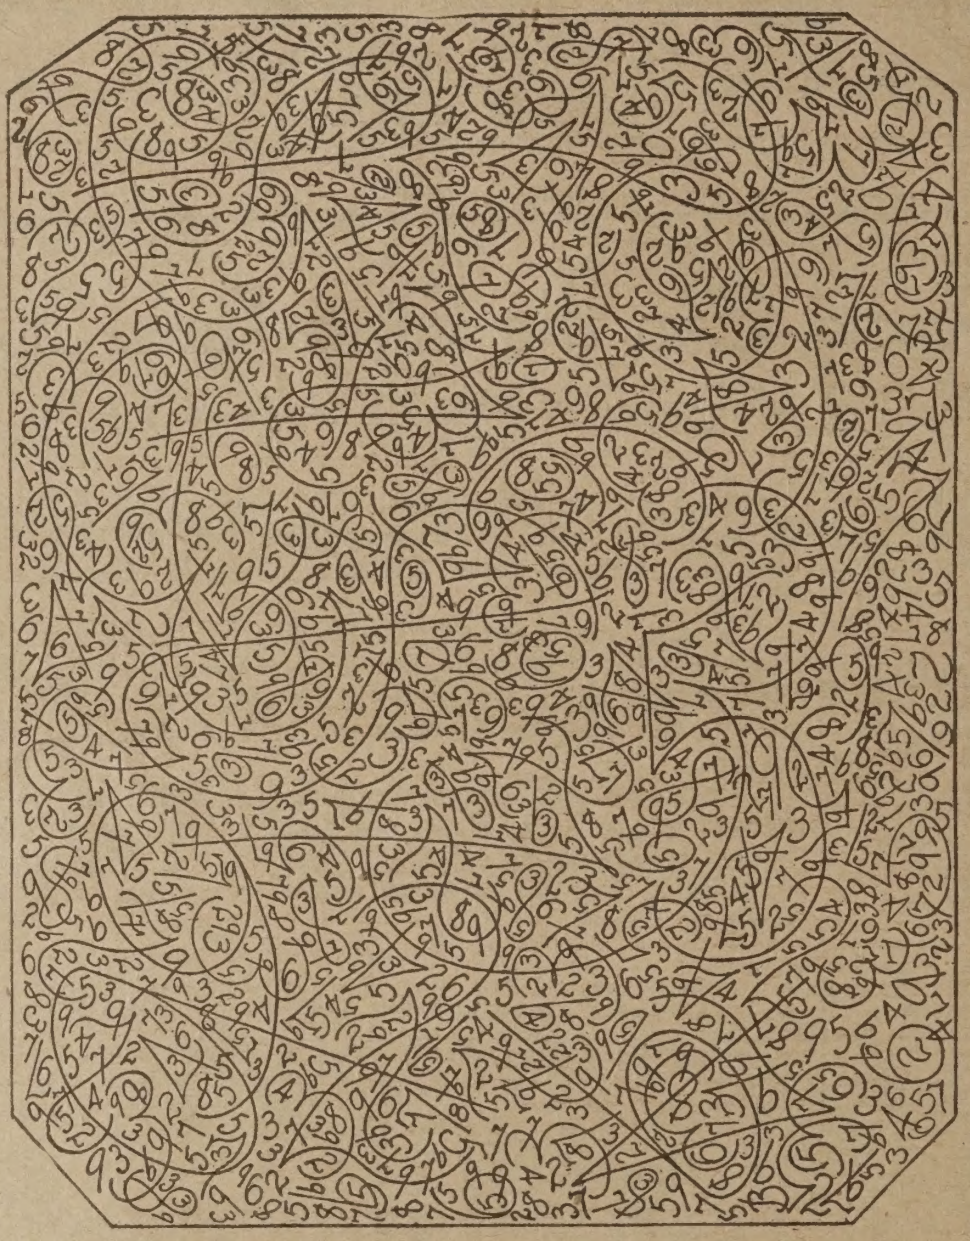
Simply take a few spare evenings and count slowly and send your total to the Contest Editor, with either $1 or $1.50 on subscription. It will pay you, however, to send $1.50 instead of $1, thereby giving you the advantage of the big special offer of

Three Years, $1.50

This special offer will last only during the life of this contest. And, besides, winners of the first four prizes will profit in dividends in addition to the fixed prizes according to the amount paid in on subscriptions. **See dividend plan.**

Contest Closes March 17, 1917

In submitting your solution always use the registration blank on this page. Read it carefully and fill in blank spaces. Then cut it out, following border closely, and send it in with the amount you wish to pay.



TAKE NOTICE — You can not lose in this contest, because, should you fail to receive one of the cash prizes, you will get full value for every cent expended in the form of a paid-up subscription to the Farmer. Where you pay $1.50 it means that you get this paper for three years.

Notice!

Solutions unaccompanied by cash payment on subscription will not be registered. Use registration blank on this page.

Employes Barred

Employes of this paper or members of their families are not eligible to enter this contest.

Here's How

Simply add up the figures in the puzzle chart as if they were in one long column.

Your success depends on the accuracy of your total thus obtained.

Figures run from two to nine, and there are no double figures or characters which are not figures. The tail of the "6" has a decided curve, while the tail of the "9" is straight. All other figures have the usual characteristics, allowing no question as to the identity of any figure

In event that no one submits the correct total, prizes will be awarded for the next nearest solutions.

This contest is restricted to persons residing in the states of Washington, Idaho, Oregon and Montana.

A payment of $1 to $1.50 on subscription to the Farmer entitles the subscriber to enter the contest.

The money paid will be credited on subscription to the Farmer. The advantage of paying $1.50 instead of $1 is that the winner of any of the first four prizes receives additional prize dividends proportioned liberaly on the amount paid in on subscription, besides the fact that $1.50 during this contest pays for a three-year subscription to the paper, while $1 pays for only one year.

More than one solution may be submitted by any contestant, by an additional subscription payment of not less than $1 nor more than $1.50. It is not necessary to pay the same amount with each solution if more than one is submitted.

As many prizes will be reserved as there are people tied before any prizes are awarded to those sending in less correct solutions.

While the winning of a prize does not depend upon the time a solution is registered, it is best to begin counting at once and send in your solution as soon as you have finished, and if later you find that you have made a mistake you can send in another solution if accompanied by an additional payment.

You can send in a subscription for some one other than yourself and have the solution registered in your own name. Remember, that by paying $1.50 instead of $1 on subscription, the larger will be your dividends if you win one of the four leading prizes; but not more than $1.50 will be received with one solution.

$750—Thirty-Two Prizes—$750

FIRST PRIZE, $200,
to which will be added 50 times the amount paid by the subscriber with the winning solution. For example, if you pay $1.50 on subscription, this prize will be worth $275.

SECOND PRIZE, $100,
to which will be added 30 times the amount paid by the subscriber with the winning solution. This prize may be worth $145.

THIRD PRIZE, $60,
to which will be added 20 times the amount paid by the subscriber with the winning solution. This prize may be worth $90.

FOURTH PRIZE, $50,
to which will be added 10 times the money paid by the subscriber with the winning solution. This prize may be worth $65.

FIFTH PRIZE, $40.

SIXTH AND SEVENTH PRIZES, Each $20.

EIGHTH TO SIXTEENTH PRIZES, Each $7.

SEVENTEENTH TO THIRTY-SECOND PRIZES, Each $2.

Examine This Dividend Plan

The following table shows what amount will be added to the first, second, third and fourth prizes by subscription payments of $1 or $1.50.

First Prize

$1.00 on sub. wins.....$50.00
$1.50 on sub. wins.....$75.00

Second Prize

$1.00 on sub. wins $30.00
$1.50 on sub. wins..... $45.00

Third Prize

$1.00 on sub. wins $20.00
$1.50 on sub. wins.....$30.00

Fourth Prize

$1.00 on sub. wins.....$10.00
$1.50 on sub. wins $15.00

REGISTRATION BLANK

Cut out this blank closely around the border and send it in with your solution and money.

SUCCESSOR TO

Vol. 40. No. 1 THE RANCH PACIFIC DAIRYMAN HORN AND HOOF January 4, 1917

Pacific Northwest Farm Loan Bank

To Be Located in Spokane to Serve the Farmers of the Four States

Uncle Sam now stands ready to serve the farmers of the Pacific northwest—if they want land mortgage service.

The federal farm loan board has divided the country into 12 districts and named the cities that are to have the 12 federal farm loan banks.

Washington, Idaho, Oregon and Montana are made a district, and the federal bank for that district will be Spokane.

The board's next important step will be the appointment of five directors, who will temporarily manage the business of the farm loan bank in this district.

When these five directors have organized and appointed their working force the bank will be ready to do business with the farmer who wants a long-time loan at a low rate of interest.

Local Association.

But the farmer can not do business as an individual with these federal farm loan banks. He must put in his application for a loan through a local farm loan association, and must himself be a member of that association. He and his neighbors can organize a local association.

It is now up to the farmers to volunteer their support and cooperation. Exactly to the extent that they shall organize or fail to organize their own farm loan associations the system will flourish or it will fail.

Some say the farmers lack the cooperative spirit and ability to make this new system a success. They say that rather than go to the bother of organizing associations the great bulk of the farmers of the United States will go on borrowing money through the old mortgage channels.

There is too much of the cooperative spirit among the farmers, dairymen and fruit growers of the Pacific northwest to warrant a fear that the new system will fail in these four progressive northwestern states.

A Point of Confusion.

When the federal farm loan act was passed the Farmer expressed serious doubt of the wisdom of that feature of the law which permits the organization of private joint stock land banks in competition with the farmers' cooperative organizations. The following letter from a Twin Falls, Idaho, reader shows the confusion resulting from this conflicting provision:

"I have been watching the Idaho Farmer for all the information I could get in regard to the farm loan act," writes Ed Vance. "I would like to join a loan company if there is one in this part of the country. A few days ago a couple of men were here claiming to be organizing a farm bank loan association under the federal law. They were supposed to represent a Salt Lake concern. Had they or any bank the right to make such claims? They are running around the country in a car getting farmers to buy stock. I wish you would put me on the right track."

Apparently these men are agents for a proposed "joint stock land bank." If their methods are proper they are within their rights under the law, but they ought to make it clear to every farmer solicited to subscribe stock in their company that they are not organizing a national farm loan association.

By N. W. DURHAM

Chairman Spokane Committee on Federtal Land Banks.

Distinctly Cooperative.

National farm loan associations are distinctly cooperative. They are local organizations of farmers wanting to borrow under the new system. They do not peddle stock. Only farmers can join them. They are the foundation of the federal farm loan system.

On the other side, joint stock land banks are corporations "for carrying on the business of lending on farm mortgage security and issuing farm loan bonds." They may be organized by any and all classes of people—by bankers, by merchants, by miners, by speculators, by money loaners.

The law provides that "no joint stock land bank shall be authorized to do business until capital stock to the amount of at least $250,000 has been subscribed, one-half thereof paid in cash and the balance subject to call by the board of directors, and a charter has been issued to it by the federal farm loan board."

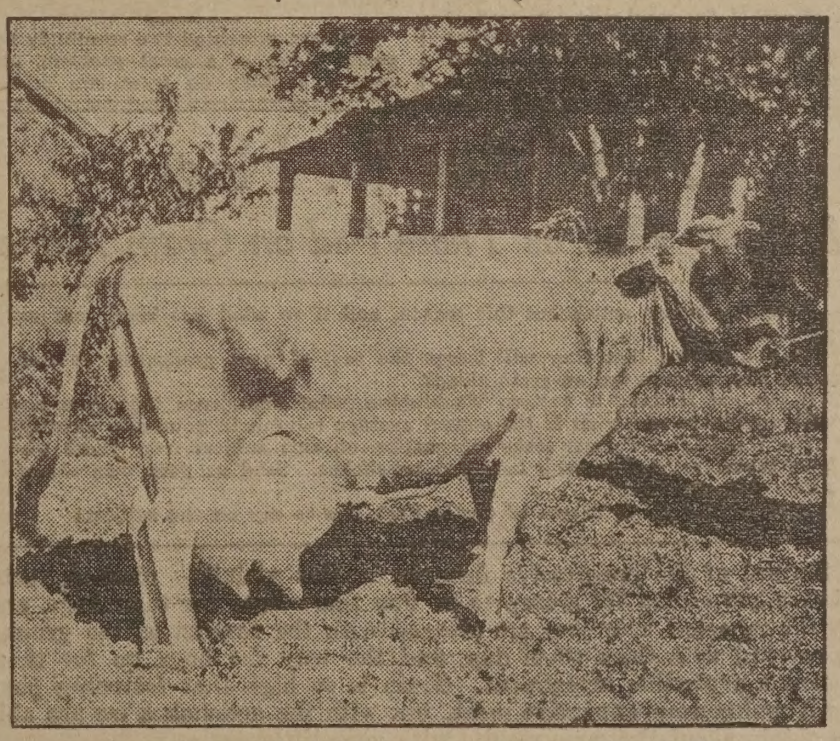
Our advice to Mr. Vance and all other farmers is to go slowly in doing business with organizers of these joint stock land banks. Some of them are doubtless proceeding in good faith and are financially and morally responsible. But unfortunately the law makes it possible for irresponsible men to work the farmers.

Under no circumstance should a farmer go into one of these ventures unless he knows of his own knowledge, or is advised by some one in whom he has complete confidence, that the men asking him to take stock are both honest and capable. Men soliciting subscriptions for one of these joint stock land banks may be swindlers; or, if honest, they may lack the business capacity to make a success of the venture, and in that case the subscribing farmer would lose his money.

Our further advice to Mr. Vance is to circulate among his neighbors and get them to take steps to organize their own local national farm loan association. The government of the United States will be back of that and they can not lose. The government is not back of stock in joint stock land banks.

A national farm loan association may be organized in any community where 10 citizens owning land desire to borrow an aggregate of not less than $20,000. The land must be unincumbered or the proceeds of the loan must be used, in part, to remove any lien. Loans may be as small as $100 or as large as $10,000.

Let it be plainly understood that farmers can organize at once, but they can not borrow money until the federal land banks are established.



The national farm loan associations are not limited as to the number of their members. After one is organized it may serve an entire neighborhood by receiving new members.

Big Bend Farmer Would Join.

R. V. Jones, writing from the Hotel Nelson, 2013 Second avenue, Seattle, says: "My son and I own land in Lincoln county—nine miles north of Irby, 16 miles northwest of Odessa, 20 miles south of Wilbur—and would like to join some farm loan association. Do you know of any forming in our locality or near there? If so, how can I get their names?"

Can any reader of the Farmer give Mr. Jones the desired information?

Over 700 Pounds of Butter

The above is a photograph of Melia's Laurie of Albany, No. 234432.

R. B. Sanford of Ashland, Ore., her owner, writes: She gave, as a 5-year-old, 11,372 pounds 3 ounces of milk and made 707.08 pounds of butter, 85 per cent fat in 365 days, with ordinary farm feed, consisting of pasture only in summer, what mixed hay she would consume with 40 pounds Mongold beets and eight quarts bran per day in winter, with some green sweet corn stalks in fall to supplement short pasture.

At present she is 8 years old and weighs 905 pounds and is giving 15,921 pounds milk per year, which at her average test of 5 per cent would make 990 pounds of butter in 365 days.

Work Stock

Can the Farm Supply Own Needs?

(Continued from page one.)

(4) How are horses selling in your locality, and how do these prices compare with those paid five years ago? (Replies indicate great differences in local markets, but generally high prices, in excess of five years ago.)

(5) Do yearlings and 2-year-olds sell in your community for prices relatively as high as horses of work age? (This question, together with No. 1, developed a situation so contradictory on the face of it that another article dealing with those two questions alone will be given next week in the Farmer).

(6) In your locality, to what extent have horses been supplanted for farm work by tractor engines? (The replies indicate that the tractor is yet a novelty in almost every community, if in use at all).

(7) From your experience, what would you say it costs to raise a colt from breeding to four years old, the mother a common good work animal and the sire a purebred? (Estimates ranged from $50 to $250, which an average of approximately $115).

(8) Are there any, and how many, purebred stallions and mares in your community? (The replies indicated a reasonable number of purebred sires, but very few purebred mares).

Must Be Adapted.

C. E. B. Roberts of Rupert, Idaho, recommends that the farmer raise horses, but that if he goes into it with a view to selling on the market he must be specially prepared for that kind of business. He says:

"While most any farmer can raise to advantage horses enough for his own supply, I doubt if the average farmer should raise horses for the market. It is a department of farming that requires special adaptation and facilities.

"A breeder should have mares well above the average, as well as good sires, if he expects to raise horses to sell."

Should Raise Only a Few.

W. J. Sutton of Cheney, Wash., adds the following comment to his replies to the questions asked:

"On a wheat farm a few colts can be raised each year at a very low cost. The brood mares can be used for the light work until weaning time. Mares with colts can not stand work in big plow teams and other heavy work and the colts would be stunted in their growth. For this reason, one can not afford to raise many colts in one season for he would be forced to buy more work animals. But enough can be raised to take the place of animals that die or are disabled."

For Home Use Only.

W. L. Sheard of Dayton, Ore., says that the average farm is not a good place to raise horses for the market, but that the average farmer should raise the stock he needs for farm use. "It costs me about $125 to raise a colt to four years old and raise it right," he says, "feeding some grain all the time. The colt earns his own feed after two and a half years old.

"A farmer that has good mares that suit him can better afford to raise his own work horses than to buy, as a rule, as he can expect the colts to be what he wants. It is sometimes hard to buy just the kind that he is looking for. As for raising horses for the market at the present prices, that depends entirely on how a farmer is situated for business."

Depleting Lands at a Scandalous Rate

American Farmer Might Be Likened to Foolish Spendthrift With Kind and Indulgent Father

William J. Tod, the writer of the following letter is one of the vice presidents of the National Live Stock associations:

Mr. Tod's Letter.

To the Editor of The Washington Farmer: With great pleasure I have read the article by Dr. E. A. Bryan in the copy of The Washington Farmer which you were kind enough to send me.

The article from beginning to end is altogether excellent and I heartily indorse every word Dr. Bryan says. The deeper he thinks on the subject the more I am sure Dr. Bryan can have to say. The article is sound and logical, but he has only touched on the great question.

There is one great subject which Dr. Bryan does not even allude to; viz, during the many years when all farm products were selling so low we were then depleting our lands at a scandalous rate. We were not living, as prudent people should, on our income, but were rioting on our capital. Dr. Bryan is no doubt aware of the steady but rapid reduction in the yield per acre of wheat all over the eastern states. In great districts over the east and south the lands became so exhausted by continous cropping, with nothing returned to maintain fertility, that these lands became practically worthless. The poor devil of a farmer had to scratch for a living. Bacon and beans seemed the height of his ambition. His whole intellect and energy were taken up in trying to clothe and feed his family and overworked wife. He could give no time or thought to preserving his soil, he had to eat the goose to keep alive. As the brightest of his sons grew up they heard of the millions of acres of virgin soil still free in the glorious west, and the exhausted lands were disposed of at such a sacrifice that it might be called abandonment.

The American people had the 6-cent to 10-cent eggs, the 5-cent milk and the 1-cent flour at the expense of the land with the work of the farmer and his wife and family thrown in; in short, we were draining the life blood of the nation. Our American farmer might be likened to the foolish spendthrift son with the kind indulgent father. The first gift was a handsome one, but it was run through. The old man gave him another start in the middle states, and now he has a third start away out west. The old man has got to about the end of the rope, and it behooves Dr. Bryan and others like him to remind the foolish one that he must live within his income or trouble is ahead. All Dr. Bryan says is sound and good, and he has lots more to say, and I am sure we shall all be glad to hear more from him again.

WILLIAM J. TOD.

Maple Hill, Kansas.

Hits the Nail on the Head.

The following letter is from T. W. Tomlinson, the well-konwn secretary of the American National Live Stock association:

To the Editor of the Washington Farmer: I have received your letter of November 30 enclosing clipping of an article by Dr. E. A. Bryan. Mr. Bryan has hit the nail on the head. The era of low prices for farm products and live stock has passed and never will return, in my judgment. It is better for the entire country that the farmer and stockman are finally coming into their own. T. W. TOMLINSON.

Denver, Colo.

Says It's a Mistake.

A. E. De Ricqules is general manager of the American Live Stock and Loan company of Denver, and is also a member of the executive committee of the American Live Stock association:

To the Editor of The Washington Farmer: Thank you for your favor of the 30th ult. enclosing copy of statement by Dr. Bryan. So far as the high cost of living is concerned there is quite a mistaken notion around the country just now as to what it really costs. For example, we find by investigating the question quite carefully that the retail price of beef in cities like Washington and New York is only about 2 cents a pound more than last year, and that in fact beef is the cheapest food one can get today, when you continually hear a howl about the high cost of beef. Fat cattle from the northwest have sold for less money than they did last year or in 1914. Wholesale dressed meat is about the same as for the last two years.

A. E. D'RICQULES.

Denver, Colo.

> Herewith are reproduced two paragraphs from Dr. E. A. Bryan's article in the issue of The Washington Farmer of November 30.
>
> "A universal scream greets the rise in the price of farm products, until eggs retailed at 40 and 50 cents a dozen, butter at 40 cents a pound, potatoes at 2 cents a pound and flour at 4 and 5 cents a pound, seem out of all reason. But, as a matter of fact, the American public has been so long accustomed to prices of farm products that were unreasonably low, that it is largely by contrast that present prices seem so outrageously high. There was a day when eggs at 10 to 15 cents a dozen and butter at from 20 to 25 cents a pound and milk at 5 cents per quart delivered at the door and the choicest cuts of beef at 15 cents a pound and flour at a cent a pound were accepted by the consuming public with complacency, regardless of the fact that the producers of these commodities toiled early and late without fair or equitable return for their labor.
>
> "The farmer alone has no recourse for redress until enough of them are pushed out of that occupation so that high prices are inevitable. And high price is the remedy for the depletion of our agricultural classes. And high prices and profitable employment must precede abundant supply and a lower cost of living for the consuming public. The high cost of living is a Godsend to the American nation. Only thus will the tide be turned."

Agrees With Every Word.

Robert Graham, the writer of the following letter, is president of the Nebraska Stock Growers' association, and is also a member of the executive committee of the American National Live Stock association:

To the Editor of The Washington Farmer: Your letter of recent date received enclosing clipping from The Washington Farmer, and asking my opinion on an article by Dr. Bryan relative to the boom in prices of foodstuffs.

In reply will say that I heartily agree with every word of Dr. Bryan's and I am sure that the circulation of such articles will have a salutary effect on the real tillers of the soil and those engaged in producing the meat supply of the nation. The producer for many years past have not been getting a fair share of the prosperity abroad in the land and it is about time that the producers of the nation cease to be the hewers of wood and drawers of water for the balance of the people. From the viewpoint of a cattle producer I will say that the industry is at present in our state barely paying interest and running expenses caused from the necessity of owning our own lands and the added cost of production. I heartily agree with the wage-earner that he is entitled to a higher wage and better working conditions, but I would like to know who labors under worse conditions than the agriculturist, neither heat nor cold, rain or shine is taken into consideration in his work, he must work at all seasons and under all conditions, depriving himself of many of the comforts of modern civilization, and yet when the pinch of high prices is felt he is the one who must be deprived of a fair recompense for his toil. As an illustration of the unfairness of the clamor of a portion of our people that an embargo be placed on foodstuffs so as to cut down the prices that the farmer is receiving for his products, I might cit you to conditions as prevailing in my own community; round steak is selling at wholesale in Denver, Colo., at 12 1-2 cents per pound, the freight charges to Alliance, Neb., are 65 cents cwt., allowing another 1-2 cent for drayage, it reaches the retail butchers' block at a trifle over 14 1-2 cents per pound, yet when it reaches the table of the housewife's kitchen it costs 25 cents per pound, or in other words the beef raiser, the packer and the railroad receives 14 cents for three years labor and the retailer receives 11 cents for not over two hours' labor, and yet the retailer claims that he is not making an excessive profit on the transaction, caused by the increased cost in delivery, etc. ROBERT GRAHAM.

Alliance, Neb.

Buys Wheat Farm.

A deal has just been completed during the past month whereby Emory and Malcolm McCown, well-known Waitsburg farmers, acquire what is known as the "Columbia Center" stock and wheat farm, located nine miles south of Pomeroy, Wash. The consideration was about $50,000, or $40 per acre. Part of the land is wheat land and part is grazing land.

Calamity or Blessing?

Which Would Large 1917 Wheat Crop Prove to Nation?

"We ought to raise such big crops that circumstances like the present can never occur."—President Wilson in a recent address touching upon the high cost of living and the problems that it has created.

"While it is the duty of farmers adequately to supply the national larder, overproduction would visit upon the nation an unwarranted calamity, and the farmers should save the country from such a predicament. . . . . The greatest peril which confronts American agriculture today is abnormal increase in acreage and yield of crops." —Henry N. Pope, president of the Association of State Farmers' Union Presidents in a formal statement recently issued.

Here are presented two seemingly opposite views of a great problem, and coming as they do from two of the foremost men of the nation they command the consideration of the wheat producers of the northwest. Should the farmer put forth his effort to produce large grain crops next season? Or should he be careful lest he produce too much? Do large crops and low prices necessarily go hand in hand, or small crops and high prices? And if so, which is best for the farmers, the large crop and low prices or the small crop and high price? The opinions so pointedly stated by President Wilson and Mr. Pope naturally lead to such questions. In part Mr. Pope's statement reads:

"At the beginning of 1916 we had a surplus of approvimately 160,000,000 bushels of wheat in the granaries and elevators of the United States. This surplus added to our 1916 production of 607,000,000 bushels gives us over 100,000,000 bushels above domestic consumption this year. While it is likely that we will begin our 1917 harvest with empty granaries we must not forget that the warring nations have increased their combined wheat areas since the beginning of the war almost 20 per cent and this year's production, taken as a whole, is 92 per cent of normal, although it is 72 per cent below that of last year, which was an abnormal year.

"The wheat farmers of this country, taken as a whole, have had a bad year, as the following statistics taken from the Crop Reporter, issued by the federal agricultural department, show: The 1916 wheat crop will bring the farmers in the United States at least $200,000,000 less than the 1915 crop and $100,000,000 less than the 1914 crop. In 1915 we harvested 59,989,000 acres of wheat yielding 1,011,505,000 bushels, for which the farmer received $930,302,000. In 1916 our average was reduced to 50,871,000, yielding 607,000,000 bushels, and to date 75 per cent of the crop has been sold off the farms at an average price of $1.18 per bushel.

"While it is the duty of the farmer adequately to supply the national larder, overproduction would visit upon the nation an unwarranted calamity and the farmers should save the country from such a predicament. There is more poverty in 6-cent cotton and 50-cent wheat than in any condition that can be surmised. The greatest peril which confronts American agriculture today is abnormal increase in acreage and abnormal yield of crops."

Artichokes for Hogs

Look as Well as Those Fed on Grain Alone

Have you grown artichokes this season, and if so what has been your experience?

Do you believe that they will lessen the cost of pork production as compared with animals fed on grain alone?

If you are farming in eastern Washington what experience have you had with artichokes and what is the annual average rainfall in your own vicinity?

The Washington Farmer seeks information on this subject from those who have grown artichokes, who have fed artichokes. Send us your own experiences with artichokes.

Here is what C. C. Brown of Castle Rock has to say on the subject:

Several of the progressive farmers in this vicinity planted artichokes last spring for a crop to be dug this winter for their hogs, and by the reports I hear they are pleased with the results, as the ground is covered with them when dug, and the way the hogs go for them makes a profitable investment. Grain is so high that fattening pork on it makes very expensive meat, but with the artichokes we are able to obtain about the same results with very little grain.

I find that my artichoke hogs look as well as those of my neighbor's that are fed on grain alone. Later on I will turn the brood sows for a few hours each day in the artichoke field to root out what they want. It will give them exercise and feed at the same time.

My opinion is that this tuber has not been grown as much as it should have been by the farmers, as nearly all stock will eat them and the cultivation is easy compared with other crops. The yield, as a rule, is large. My half acre will average 500 sacks.

Uncle Sam, Middleman

Wide Call for National Market Conference

A nation-wide conference is to be held in New York city in April, with a view to establishing a great national market, through which food products, both for consumption in that city and shipment abroad, would be handled under governmental supervision.

The object is to work out plans, if possible, for the elimination of the middleman as an economic factor.

The conference is called by Joseph Hartigan, New York's commissioner of weights and measures, who took a prominent part in the recent New York dairy strike, and is said to have the approval of Mayor Mitchel of that city. Mr. Hartigan says he has assurances that the conference will be attended by leading producers and shippers from every state, as well as official representatives appointed by the governors, to take up practical details of the plans.

The outcome of this conference will be awaited with interest. Past efforts to cut out the middlemen have usually ended in failure, but previous efforts were private and not public in nature. It is now proposed to call in the cooperation of the government. Some want Uncle Sam to become their middleman. Others think state action the thing. And yet others would have the cities go in for publicly-owned markets and publicly-owned stores of all kinds.

This movement puts a new issue before the American people. Some of its critics say it is but an entering wedge for socialism. After the government had gone into the business of distribution, they say, the socialists would soon call for government ownership and operation of the various industries of the nation—for government production.

We think this is a subject for farmers and their wives to ponder upon during the long winter evenings and snowy days, for it is apparent that the country is on the verge of a new and stupendous issue.

MIX STRAW WITH ALFALFA

According to the Omak Chronicle.

Orchardists are laying in a big supply of fine reservation straw to mix with their alfalfa hay as a winter feed. The sale of all of their straw was a nice little pickup for the reservation this year.

Farm Loan Association.

Forty farmers gathered at the Independent Grange hall in Okanogan, Wash., and took the initial steps toward the organization of a national farm loan association, under the provisions of the new farm loan law, with a charter membership of 25, the desired loans totaling about $25,000. After a discussion of the provisions of the new law a list of nine directors to handle the work was selected, as follows: U. E. Fries, C. D. Norton, George Hosier, John Durham, F. P. Boan, Edward Barker, A. R. Murray, Frank Carleton and John Sampson. The directors later chose the following officers for the local unit: A. R. Murray, president; C. D. Norton, secretary-treasurer; F. P. Boan, U. E. Fries and George Hosier, executive committee.

Alder Logs in Demand.

Several thousand feet of alder logs have been gotten out on the Kalama river, Washington, recently to fill an order. Alder is used extensively in the manufacture of furniture, and is also used to some extent in the pulley industry. Experts say that pulleys made from it stand greater strain and are not easily split.

crepancies in the communication of A. W. Landon in the issue of The Idaho Farmer bearing the date of December 14.

First, "You can not get something for nothing out of the old cow." Now, if Mr. Langdon will get just a common dairy cow, Ayreshire breed preferred, and turn her loose in the morning she will go out along the highways, byways, hedges and ditches and gather up the waste and come home at night bringing four gallons of milk and one and one-half pounds of butter, worth about six bits, and by his own figures it would cost but six cents. That is so near something for nothing that you might as well call it clear gain. The trouble is we have too many "managers of dairies." The profit is managed out of a good many dairies.

According to Mr. Langdon the average production of the dairy cow in Washington is 180 pounds of butter fat. He says that a large number of dairymen are producing 300 pounds per cow, but it takes a 300-pound man to make them do it. Well, then, there must be a lot of dairymen producing a good deal less than 180 pounds per cow and by the same token the man must weigh a lot less than 180 pounds.

Now I will bet a quart of buttermilk that there is more clear profit made on dairy cows that produce 180 pounds of butter fat or less than there is on cows that produce more than that, for the reasons I have already intimated.

In support of this very unusual and unbelieved, if not unbelievable, assertion I want to call attention to an instance well known to the editor and readers of the Idaho Farmer. Not many years ago one George Leighton, well

(Continued on page nine.)

Optional Commission.

At the tri-county convention of the farmers' union of Garfield, Colville and Walla Walla counties in Washington the recommendations of a committee were adopted that the farmers' union submit a bill at the coming session of the legislature, providing for a law which will authorize an optional commission form of government for counties so voting.

Prunes Are Profitable.

That purnes are paying growers well this year in localities that produce them successfully is indicated by the report from Clarke county, Wash., where C. J. Nichols of Felida reports a harvest of 36,000 pounds from five acres. His crop brought him over $2300.

Diversify Farm Crops.

Diversify on farms and save trouble on the marketing end, was the advice given by Professor W. S. Thornber, head of the extension department of Washington State college, who opened the 1916 short course for farmers at North Yakima. "Much of the difficulty experienced is not from overproduction, but from poor distribution, and until we can adjust these factors permanently we must adapt farm conditions to marketing limitations," he said. "Every acre, every unit, whether horse, cow or tree, must be a producer if success is to be obtained. Every farm of considerable size must be diversified. The one-crop system not only robs the soil, but also the producer. Intelligent diversification offers a solution for many problems now confronting orchardists."

George Warren Ranch.

The sale of the well-known George W. Warren ranch of 1400 acres on the Palix, near Bay Center, Pacific county, is reported to have been practically concluded. At least one California man is interested in the purchase with an object of colonizing the land and tracts of 40 acres. The tract contains 900 acres of fine dike tide land and the balance wooded upland.

It is interesting to note that Mr. Warren recently purchased between 160 and 180 acres, not far from his old ranch and proposes to develop on it a fine Guernsey herd. He has recently purchased a fine Guernsey bull from the herd of A. L. Gile and is taken up with the idea of a cross between the Guernsey and the Holstein.

Okanogan Pomona Grange.

At its last regular meeting at Malott, the Okanogan County Pomona grange elected the following officers: Master, F. C. Graham; overseer, Mrs. J. L. Freeman; lecturer, Arthur Wells; secretary, J. L. Freeman; treasurer, W. T. Beals; steward, Ben Garigen; assistant steward, Mr. Willetts; chaplain, Mrs. Jennie Wells; gatekeeper, U. E. Fries; ceres, Mrs. W. C. Ostenberg; flora, Mrs. George Rudolph; pomona, Mrs. U. E. Fries; lady assistant steward, Mrs. Ambrose Murray.

Hender to Run Farm.

R. Hender has purchased a 420-acre farm north of Pomeroy, Wash., from Jesse Morris, and, having sold his town residence and furnishings to John Keatts, will move on the farm and run it in the spring.

Takes a Squint at Dairying

And Finds Ordinary, Not Fancy, Cows Are Profitmakers

A Payette reader takes a squint this week at the dairy problem from a new angle. He contends that the real profits are found in the ordinary cow rather than in the high-priced fancy herds. One need not agree with all that Mr. Ainey says to realize the force of his reminder that if the advice of the specialists were taken literally and generally applied, and only the top notch producers kept in the dairy herds of the United States, "that would reduce the dairy products of the United States fully 75 per cent."

In this connection it is pertinent also to say that prices of dairy products must be sufficiently high to enable the man of ordinary ability and industry to make a fair living. In dairying, as in all other occupations, the average man is very largely in the majority. If standards of regulation and prices are made so difficult that only the exceptional dairyman can survive, the dairy industry as a whole will be in danger of destruction.

Prices of dairy products should be high enough to let the average producer earn a fair living at least. Then the exceptional dairyman will have his exceptional reward, and that is as it should be, for the general tendency will be toward a gradual uplifting of the dairy industry of the nation.

We are sure our readers, whether dairymen or not, will be interested in Mr. Ainy's letter given herewith:

Mr. Ainy's Letter.

To the Editor of the Farmer: I have been reading the discussion in the dairy business in the Farmer with much interest. Some of the letters published are interesting, some instructive, some amusing and some misleading. I often feel like putting in an oar, but I remember that I have had about 45 years more experience in the dairy business than I have in writing for publication. I presume the reverse is true of some of those who have been writing for the Farmer. In this letter I want to call attention to some dis-

A ton of butter removes from the soil less than a dollar's worth of fertilizing elements, is the statement of Secretary of Agriculture D. F. Houston in his annual report.

Will Not Suppress News

Of Importance to Farmers of Pacific Northwest

The Farmer has received several letters from eastern manufacturers of farm machinery, objecting to its recent publication of news of a confidential conference at Chicago of representatives of various agricultural machinery houses.

The news article in question was given news prominence because it carried information of intense interest to every farmer in the United States. It began with this parapraph:

"A conference of farm machinery manufacturers, held behind closed doors in Chicago a few days ago, gives rise to a fear that a great trust is in process of formation, and that the farmers may shortly be called upon to pay still higher prices for the machinery that is so necessary to the modern production and harvesting of crops."

The Farmer feels that it owes a duty to its readers to give them the news of such important events as the close conference of manufacturers at Chicago. At the same time it felt that fairness required it to print such explanations as the manufacturers might offer for the advance in prices of farm machinery, and the news article against which complaint is lodged carried this statement from the manager of the International Harvester company at Spokane:

"I should not be surprised to see an additional advance before next spring. (The company had recently announced an advance of prices in harvester machinery of about 15 per cent.) The increases are due to the high prices of bar steel, pig iron, cloths and leather used in our industry. Bar steel has gone up about 130 per cent in 18 months, pig iron is up 80 per cent or more and leather and cloth that we use in harvester machines are out of sight. A seven-foot binder that cost the farmer $165 a few weeks ago will cost him about $180 now. The increase to the wholesaler has been about 15 per cent, but I believe the retail price is advanced only about 10 per cent."

The Farmer could better answer the complaining letters if the writers had been more specific in their criticism. Do they mean to deny that the Chicago conference was held, and behind closed doors? We think not. Do they deny that the manufacturers in that conference discussed price advances and decided to require cash payments from farmers, instead of accepting long time credits and instalments, the present practice? Probably not.

The Farmer wants the facts and nothing but the facts. If the Chicago conference was not held to bring the manufacturers into an agreement, express or implicit, formal or informal, to advance prices, we should gladly publish any proofs to that end.

But the Farmer can not and will not suppress news of deep importance to the agricultural producers of the Pacific northwest.

Subscription price: $1.00 a year—3 years $2.00.
Canada and foreign, 1 year $1.50.

OUR GUARANTEE TO SUBSCRIBERS.

Any subscriber who does not feel that The Washington Farmer is worth to him all and more than the subscription price may order the paper discontinued and the unusued portion of the amount paid for the subscription will be refunded. You must be satisfied.

Entered as second-class matter January 13, 1916, at the postoffice at Spokane, Washington, under the act of March 3, 1879.

GUARANTEE OF ADVERTISEMENTS.

We guarantee every subscriber against loss through dishonesty or swindle by any advertiser in this publication; we do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Complaints must be sent us within 30 days from the date of the transaction, and the subscriber must have mentioned The Washington Farmer when writing the advertiser. This guarantee applies to live stock, except that we will not be responsible for claims for damages on account of disease in stock sold through these columns.

Cultivate the Foreign Students

There are about six thousand foreign students attending American colleges, which include about 1500 Chinese, 1000 Japanese and 500 from the Philippines. The possibilities, economic, social and political, through this source, can hardly be overestimated.

In the main, foreign students represent influential families, and still more important, they will, on the average, constitute an influential element in the business and political world. Most of these students pursue technical courses. Their knowledge of materials and processes will be based on American conditions, and this can not but form a basis for larger trade with America in the future. The personal friendships formed, the understanding of our political arrangements, their sympathy with our people and their aspirations is of transcendant importance in our future international relationships.

These students are, in a very true sense, the "guests of the nation," and this point of view should be kept in view by institutions and by states. Our last legislature, with narrow and imperfect vision, wanted to charge foreign students double tuition, though the added cost of their attendance is insignificant.

We, of this state, with our close proximity to the orient, should never miss an opportunity, even if we were prompted by purely business considerations, of cultivating the closest friendships, and showing the largest measure of courtesy to foreign students.

E. A. BRYAN.

Mr. Houston's Report

The report of Secretary Houston of the department of agriculture has been received and read with a good deal of interest. A few words may not come amiss about some of the outstanding things in the report.

Since 1913 beef production has increased instead of diminishing; sheep have declined in numbers in some sections; swine have increased. The grazing capacity of the national forest ranges has been increased through systematic regulation from 15 to 30 per cent. He recommends the more extensive raising of sheep for both meat and wool.

He is more cautious than the president regarding increased production. He says: "It is highly desirable further to broaden the areas for the production of staple crops as far as experience and sound economics may warrant."

Considerable space was devoted to marketing and rural finance, principally relating what has been done. Not a little attention is given to the various live stock and plant industries under their separate heads.

There are not many recommendations in the report. He does ask authority to inspect factories producing foods, as no authority exists. This is important.

As a whole, the tone of the report is cheerful and optimistic.

Use All the Land

There are very few farms in the northwest that do not have some waste land—land not worthless, but merely uncultivated. It lies in the fence corners, along the ditches or around old buildings or barnyards. Very often it is the best land on the place, at least after having lain idle for years. It ought to be put to work. There is profit in it; there is loss if it is not utilized. It might be made use of a year or two while some over-worked acre was being given a rest, or it might be put into a regular, systematic scheme of crop rotation and made to add revenue to the farm operation.

John Bright's Advice

John Bright, live stock commissioner to the dominion of Canada's royal commission at Ottawa, is quoted as follows:

"Get Canada all set to jump in and corner the cattle trade at the end of the war by bolstering the farmer now, so that he may have an advance stock of cattle in hand and be ready to stand up for big demands."

We believe this to be most excellent advice for Canada. Does it mean anything to people of the United States? Unprecedented things are going to happen with the close of the war. European countries are going to be in a peculiar condition. They will not be heavier buyers than necessary, for they are impoverished already. They must make the best of what they have. Some things they are bound to seek here, but only what they can afford and the very best for the money.

The nation and people which profits by this business will be the one which has the goods needed at the right price. It is worth thinking about right away—worth serious preparation at once, without delay.

Show Farms

Every once in a while some rich man decides he will be a farmer. He buys many acres of land, hires a superintendent, and starts to establish a great plant, quite frequently deciding to become a breeder. Some of them have succeeded, too, but it took more than money to bring success and profit. Before any measure of success came they had to spend time and thought and get experience.

The farmer who is hard up for capital enough to make those improvements he knows he needs is apt to sneer at the "show farm." "Yes, I could have a fine herd myself if I could spend a million dollars on it."

That is true enough, but merely purchasing a lot of fine animals does not make one a great breeder. Maybe he's only a sucker.

However, that isn't what concerns us. If a rich man wants to farm or breed animals, there's no law to prevent him, so he will do it anyhow. The question is, how will it affect others around him?

There are possibilities both good and bad in the show farm. If the wealthy man is really in earnest his place may be of a good deal of help to his poorer neighbors. He can afford to experiment in some lines and test out promising theories. To a limited extent his place is an experiment station. But if he is merely playing with a hobby he is apt to do harm. He puts in a very expensive and utterly needless equipment, let us say. Others see it and think that they must do the same. The result is loss, not only for the rich man, but for those who can ill afford it.

In the east there are notable examples of the millionaire riding a hobby. In the northwest there may be some, but we have several whose work is of real value to agriculture. Let us pray for more of the latter class.

Practical Organization

R. B. Coglon, state leader of county agents in Washington, is trying to persuade the various rural organizations to include marketing in their activities, no matter what may be the primary objects of their existence. This he regards as far better than to form new organizations.

This is very true. We have plenty of organizations already; to multiply them is to add burdens to the farmers, and the result will be a lessening in the membership of all. We have the organizations now. Let them assume the work of marketing cooperation.

The Function of the Dreamer

Back in the days when our antediluvian ancestors sat around the mouths of their prehistoric caves and ate their meat raw and conversed in grunts and squeaks, the man who sat and dreamed of better things was sneered at as practical. Why, he spent his time in thinking of how much nicer it would be to build houses, or cook food, or make improved weapons, or weave grass garments—impractical fellow! Why didn't he go out and throw rocks at the mastodons and bring home some meat?

Don't despise the dreamer, for not a soul ever made a step in advance without a dream. The pursuit of ideals higher than our lives leads to better things. The dreamer without any practicality may be a failure, but he is of more use than the worker who has no dreams, for at least he may inspire others.

To grow two fruits or vegetables where only one grew before is the purpose of an experiment by the state college of Pennsylvania. It succeeded in producing half a dozen tomatoes of reported good quality on a potato plant, at the same time allowing the potatoes of the same plant to grow and mature. The tomatoes were grown on a shoot from a tomato plant grafted onto the potato plant.

Washington Gleanings

Practical road construction and road maintenance will be one of the subjects treated at the winter school of the state college next month.

The honey bees of the Yakima valley produced their owners a profit of $75,000 during the past season, according to the reports made recently at the meeting of the state beekeepers' association.

The Portland engineer who has been making investigations concerning the possibility of irrigating the Horse Heaven project in central Washington has reported that the plan is a feasible one.

The Utah-Idaho Sugar company has closed contracts with over 700 farmers in the Yakima valley to grow beets for next year's use in the new sugar factory at North Yakima. The total acreage will be between 6000 and 7000 acres.

Superintendent Kern of the Walla Walla schools has recommended that the course given in agriculture in the schools be broadened to require actual cultivation of a plot of ground by each student.

George D. Conger, superintendent of the Washington branch of the Anti-Saloon league, expresses confidence that the legislature this session will enact a "bone dry" prohibition measure to replace the present law under which liquor may be shipped in by securing permits.

What Others Say

Agricultural Journal: Away with inferior seed and scrub sires.

Farm Life: We rejoice evey time a new state goes dry.

American Swineherd: Among the forage crops tested for pork production alfalfa stands at the top.

California Cultivator: San Joaquin valley farmers are planting from 25 to 30 per cent more wheat this year than last.

Prairie Farmer: There is much in the way of community betterment and recreation that a ladies' aid society or a woman's club might do.

Ship In Wood Cooperatively

One Man Gets Over a Dollar Each for His Hens and Has His Best Left for the Coming Year—He Sells Eggs at 55 Cents.

Yakima County, Wash.—Farmers club together and ship wood by the carload into the Grandview district.

Klickitat County, Wash.—Darrington man cleared $1.03 per hen when he culled out his 2-year-old flock and sent the "culls" to the Seattle market.

Club Together.

GRANDVIEW, Yakima County, Wash., Dec. 23.—A good many potatoes and cabbages have been frozen. Fuel is plentiful. Farmers in this vicinity club together and buy wood by the carload and then divide. The only work farmers do here in the winter is regular farm chores. Both spring and fall pigs are raised. I think early spring pigs are best. The hogs are sold on foot. We have a good grange here. We have a little snow, but not very cold weather as yet. A few orchards will be taken out and seeded to alfalfa for the coming season. E. H. FAULKNER.

Hens a Dollar Each.

DARRINGTON, Klickitat County, Wash., Dec. 22.—But little damage was done by the severe frost of October and November in this section. Some of the mangels were damaged to some extent, but if fed to the stock right away there will be little loss. Owing to the frost the plowing had to be postponed until next spring. Not much attention is being paid to chickens by most of the farmers, but with good care and proper housing some profit can be made with a flock of good blooded chickens, providing you can raise some of the feed. I culled out my flock of 2-year-old chickens and got $1.03 per hen in the Seattle market, clear of expenses. I sold eggs up to last week at 55 cents per dozen. At present eggs are 45 cents per dozen, butterfat 46 cents, native hay $25 per ton. Farmers are busy with the stock and cutting their winter's wood. The social life consists of dancing and other entertainments.

C. B. NEIDERPRUM.

"Don't Hang Together."

BICKLETON, Klickitat County, Wash., Dec. 25.—The weather is somewhat cold and stormy. Snow is about six inches deep, with very little frost in the ground. Fall wheat did not come in sight, but most of it is sprouted in the ground. Farmers are optimistic, as we had nearly the same conditions a year ago and had a big crop. There has been no fall plowing done on account of very late rains. Almost every one is well prepared for winter and fuel is plentiful and the usual price. There will not be much work done this winter; some will log a little, others will keep the stoves going and feed their stock. Not very many fall pigs are raised here. I do not consider them a source of profit as they are nearly always in the way, underfoot of other stock and have not good green feed to grow on. The majority ship their hogs to Portland alive, as our local butcher does not pay enough dressed. The usual social affairs are going on this winter. This is rather a poor section for organizations; the farmers do not seem to hang together very well. Prices on all products are good. Barley and oats are $35 per ton, spuds two cents a pound and hay $20 per ton. BERT H. FAULKNER.

Raise Only Spring Pigs.

METHOW, Okanogan County, Wash., Dec. 26.—We were not altogether prepared for the cold snap and quite a few potatoes and apples got frozen, but no harm to the stock. The handicap of the fall work was the ground being too dry to plow—not the cold weather. The firewood is the same price, and lots of it on the government land yet. It is $1 per rick in the woodyard or $2 hauled. The only profitable work farmers can do is to take care of the stock and rustle firewood for the present and next summer. Mostly spring pigs are kept, as they are the most profitable. The fall pigs seem to get stunted with the winter cold. The farmers dress the hogs for what few they sell to the local butcher. The big per cent is shipped to Seattle in carload lots alive. The Civic league is the only social organization here outside of the lodges. The other organizations are of a religious nature.

CHARLES GRANT.

Have Done Pruning.

OMAK, Okanogan County, Wash., Dec. 23.—The Okanogan valley has not been visited with severe weather so far this fall, and the snow has not been deep enough to interfere with pasturage. A larger percentage of pruning has been done this year compared to last year at this time. There has been no hindrance to traffic of any kind. Pigs and chickens have been sold a little close on account of high-priced feed. The grange country club and other social organizations keep up social life to a good standard. J. O. WOODS.

Discouraged on Hogs.

ZILLAH, Yakima County, Wash., Dec. 25.—Farmers were generally better prepared as regards feed than in previous winters, owing in part to the fact that they have not the amount of stock to carry over the winter that they had a year ago. There are not nearly so many hogs and feed is more plentiful. The dry fall handicapped fall work, and unless our snow melts under proper conditions the ground will be very dry for spring work. As yet there is no shortage of fuel. Good heating coal is being delivered for $5.75 per ton. Discouraged by the low prices of the fall of 1915, the ranchers who had been raising a few hogs have practically quit the hog business. Under conditions as they are in this vicinity there has never been a fortune in the hog business, but there is no question but that the rancher who was able to get his summer or fall pigs through the winter on some cheap feed made more money. The inconveniences of city inspection have deprived the rancher of the privilege of selling in many of our city markets. And unless equipped with proper facilities for butchering I have found it just as profitable to sell on foot.

F. J. M'CURDY.

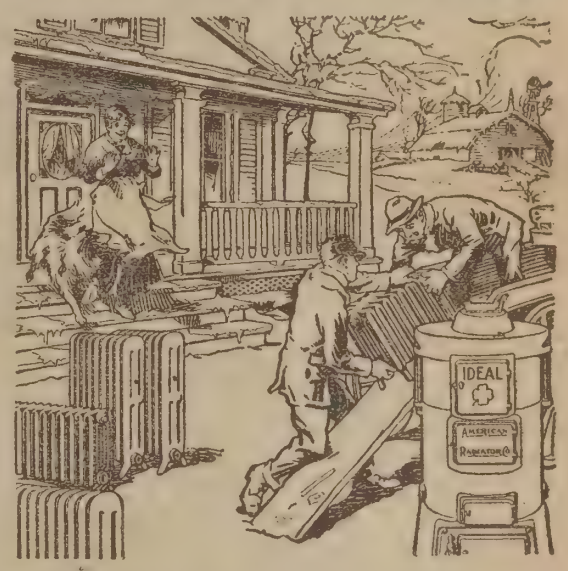
Declares Dividends.

RUPERT, Minidoka County, Idaho, Dec. 27.—We have had a strenuous fall. Sugar beet growers suffered especially from shortage of help, and many farmers have lost heavily from beets being frozen. Insufficient delivery facilitates increased the difficulties, and the growers have felt the need of a good organization. The old organization is now being developed. The Producers' association has increased their lumber department and added groceries and hardware. They have declared a dividend of 10 per cent on shares of stock and 7 1-2 per cent patronage dividend or rebate on purchases. It is understood that the Cooperative Creamery company expect to declare a dividend shortly. A new grange is being organized near here, and increased activity is being shown among older granges. The number of fall pigs have been decreasing each year for a few years, as it has not been as profitable, as a rule, to raise them. There is an increase in dressing of hogs and cattle on the farm, and it has produced a friction with the meat dealers in town. One farmer is erecting a slaughter house to stand state inspection. There is an increasing amount of beef to sell, but no ready market at reasonable prices. Home canning of meat in the winter for summer use seems likely to gain in favor.

G. E. B. ROBERTS.

Will Sow Spring Wheat.

FOSSIL, Wheeler County, Ore., Dec. 24.—The weather has been very unfavorable for either plowing or seeding. There has been a little snow, rain and frost alternately for the last two months. Very little seeding has been done so that farm work is away behind and most of this section will have to put in spring grain. Nearly every farmer has been hauling his grain to Condon, our nearest railroad, 20 miles off, and some have been hauling from 30 miles south of Fossil, making a 50-mile haul, getting $1.50 to $1.60 a bushel for their wheat in Condon, while others sold for $1 to $1.25 here at the granary. The road has become impassable, and it takes four good horses to haul an ordinary two-horse load. We voted $80,000 bonds to help build the state highway through here, and work will begin right after New Year's. I understand the 640-acre homestead law has passed, so that it is only a question of a short time when all the range will be taken up. Several carloads of Holstein and Jersey cattle, full bloods and grades, have been shipped in here in the last two or three months. It looks as if dairying ought to pay here, as we have to ship in most of the butter used in this district. Several of the farmers are talking silos, but each seems to be waiting for the other to make a start. A number of registered Shorthorns have been brought in. There are some small herds here now that are hard to beat. Our county fair was a success in every way. We had over 90 head of registered stock shown, which was pretty good for this sparsely settled county. Our farms and garden exhibits filled the courthouse from "turret to foundation stone." Our vegetables and grain were shown in the basement, and fresh and canned fruits, bread, cakes, pies and all women's work upstairs. Potatoes are selling here from $1 to $1.25 a hundred. Butter is 80 cents a two-pound roll, eggs 50 cents per dozen and hens $5 a dozen. Hay is selling at $12 a ton.



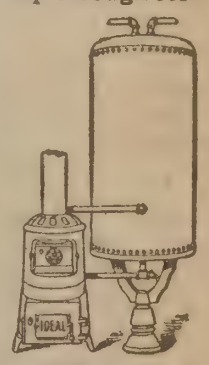
JOHN STEWART.

Woolen Factories.

Chile has two woolen factories.

Don't wait to put in IDEAL heating!

It is a mistaken idea to think that you have to wait until warm weather to put in an IDEAL Boiler and AMERICAN Radiator outfit.

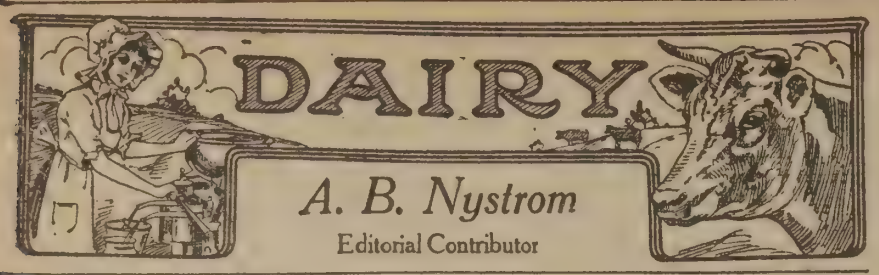


An IDEAL Boiler and AMERICAN Radiators can be put in your building just as quickly and easily in January as in August. The AMERICAN Radiators come all assembled for placing in the rooms; the IDEAL Boiler sections are easily carried in and made up into a complete boiler in basement or sideroom. The piping connecting the IDEAL Boiler with AMERICAN Radiators is readily run up through corners of the rooms, closets or out-of-the-way places, and the outfit may be completed in a few days to your utmost satisfaction. You will then notice the striking contrast between the chills and cold of old, wasteful methods, and the sure, economical heat aplenty from the IDEAL-AMERICAN outfit, making you glow all over with satisfaction.

AMERICAN RADIATORS & IDEAL BOILERS

A No. 4-19-W IDEAL Boiler and 270 ft. of 38-in. AMERICAN Radiators, costing the owner $200, were used to heat this farm house. At this price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions.

Our IDEAL Hot Water Supply Boilers will supply plenty of warm water for home and stock at small cost of few dollars for fuel for season.



Get the facts now in "IDEAL Heating" free

Don't delay another day in finding out about IDEAL heating and how you can put it in right now. Send for copy of our book, Ideal Heating, which tells you the whole story—no obligation.

Sold by all dealers. No exclusive agents.

AMERICAN RADIATOR COMPANY

Dairy Questions

Are Answered by A. B. Nystrom

I have a cow which just came fresh and is now giving bloody milk. Can you give the cause and remedy for the trouble? I have been feeding her on oat hay and rolled oats and apples, giving her one gallon of oats twice a day, two gallons of apples once a day, and all the hay she will eat. Then I turn them in the stubble field and they graze on timothy patches in the field.
F. W. B., Tekoa.

We sometimes find blood in the milk when the udder has been injured, also when it is congested and inflammed as when the circulation through it has been seuddenly increased by richer and more abundant feed, or when the cow is under the excitement of heat. Again we find that the deposit of tubercles or tumors in the udder may be sufficient causes, the irritation caused by milking contributing to drawing the blood; and again if the cow eats certain plants she may have blood in the milk. If the milk becomes red after it is drawn it may be found that it is due to the presence of micro-organisms which cause red milk. If the gland is congested the following treatment is suggested by the United States department of agriculture: One pound of Epsom salts and daily thereafter one-half ounce of saltpeter with a dram of chlorate of potassium. The udder should be bathed with hot or cold water and rubbed with camphorated lard. If the feed is too rich or abundant it must be reduced. Induration of the udder may be met by rubbing with a combination of iodine ointment, one part, and soft soap, two parts, or mercurial ointment and soap may also be used. It is imperative that the milking be done carefully.

I do not think that the feeding is at fault unless the cow has not been accustomed to getting an abundance of food previous to this. If you suspect tuberculosis I would by all means have the cow tested at once.

Drying Up Cows.

I have a Guernsey heifer 3 years old. She had her first calf at 22 months and gave 10 quarts a day. I dried her about four weeks ago, figuring she should come fresh January 4, but instead she came the 8th of December. Her udder had not begun to fill and she has not as yet come to her full flow of milk. I am letting the calf run with her now. Can you give me any reason for her not having any milk?
E. S. H., Spokane.

I do not know why your cow is not giving as much milk as she should, but I believe that the fact that you did not have this cow dry sufficiently long is partly responsible for her low milk production. We figure that it is absolutely necessary to have a cow dry at least six weeks, and preferably eight weeks, before freshening. She should be fed well for four or five weeks after she is dry, and then the feeding should consist largely of laxative feeds just previous to freshening. This tends to build up a cow's system so that she can stand the heavy strain of the next lactation period.

Butter From Pasteurized Cream.

Is there any difference in taste, texture and body between butter made from pasteurized cream and unpasteurized cream? Is there much demand for butter made from pasteurized cream?
H. J. F., Steptoe.

The principal difference between butter made from pasteurized cream and unpasteurized cream is that the pasteurized cream butter keeps longer. The texture is practically the same if the pasteurization is perfect, and there will be no difference in the taste if you compare it with butter made from good quality unpasteurized cream.

The trend is to have all cream for butter making pasteurized and I think the state will soon pass a law compelling all butter to be made from pasteurized cream. This is a matter of safeguard from disease and also to make the butter have better keeping qualities.

Record of Over 400 Pounds Butterfat

Figures of interest are brought out in the first annual report of the Buhl Pioneer Cow Testing Association of Twin Falls county, Idaho, for the year from September 30, 1915, to October 1, 1916. Gustav Kunze is president of the association, C. E. Long is secretary, and O. T. Koster is the official tester. The honor roll of cows includes 33 animals producing more than 400 pounds of butter fat during the year. This list is led by a Jersey five years old belonging to C. E. Long and is credited with the production of 10,910 pounds of milk with 569.1 pounds of butter fat. A. A. Stauffacher has a Holstein cow five years old producing 13,000 pounds of milk with 545 pounds of butter fat. The third cow in the honor roll belongs to A. Carlson, a Jersey six years old, producing 9569 pounds of milk with 498.2 pounds of butter fat. Eleven cows in all produced over 450 pounds of butter fat.

Cost of feed per cow	$43.69
Profit per cow	$39.52
Returns for $1.00 expended for feed	$1.90
Cost per pound butter fat	14.3 cents
Cost per 100 pounds milk	53.7 cents

Summary.

Twenty-four herds with a total of 337 cows completed the year's work.

The total number of cows on the records throughout the year was 681, while at the close of the year the records contained the names of 504 cows.

Seven pure bred sires have been purchased by members to replace grades throughout the year.

Fourteen pure bred cows and heifers have been purchased by members during the year.

At the beginning of the year's work 10 herds in the association had pure bred cattle, at the close of the year's work 13 herds had representations of pure breds.

Members of the association tested 6 cows for A. R. O. records during the year.

The average skim milk test for the month of September was .0200 of 1 per cent, this was one 1-100 of one per cent higher than the test for six months, the cause for this being that since the new system of cream grading has gone into effect the tendency has been to skim a heavier cream, thus resulting in some cases in the separator throwing over some butter fat.

The highest 2-year-old for butter fat production was Helen's Glory 305,227, a pure bred Jersey owned by George A. Childs, her production was 402.1 pounds butter fat.

The highest 3-year-old for butter fat production was Fortune, a grade Holstein owned by A. A. Stauffacher, with 477.9 pounds butter fat to her credit.

The highest cow for milk production was Nubbins, a grade Holstein, her production being 14,623 pounds milk.

The highest average butter fat test was that of Waters, a grade Guernsey owned by H. B. Sherman, with an average test of 6.71 per cent.

Give and Take

Is Idea of New Dairy Association

With a view to betterment through increased and dependable revenues and general stabilizing of their industry, the dairymen of Skagit county, Wash., some 150 strong, have formed an organization known as the Skagit Valley Dairymen's association.

The central aim of the organization is to secure from the company purchasing their product a guarantee of a fixed price for a period of three months, in return for which concession all members agree to sell all their milk except that needed for home use to the company so contracting with them. The price which the association is now attempting to secure for the quarter, January-March, 1917, is $2.50 per hundred pounds, an increase from $2, as now being received.

In order to secure specific and binding action the association has drawn up an agreement, already signed by almost all of the members, placing the management of this work of the association in the hands of a "price committee." This committee is authorized to enter into agreement with any reliable concern to supply the milk of all the members who sign the agreement to such concern, and, if they fail in this attempt, to undertake to establish a factory or condensery for the purpose of handling the dairy products of the association.

One feature of the agreement among the dairymen is that it shall not be binding unless 6500 cows are signed up. A penalty of $10 per cow is fixed for any member who, having signed the agreement, fails to live up to its terms.

Longer Period

New Idea Enters Cow Testing

A new idea is fast taking root in forming cow testing associations—that of organizing for a longer period than one year, says J. E. Dorman of the U. S. department of agriculture. The Buhl Pioneer Cow Testing association of Buhl, Idaho, which made an average production of 304 pounds of butter fat per cow during the first year, has taken the lead in this respect and has just reorganized for a period of three years with 25 of the 28 members remaining in the association for the three-year period. Other associations are considering this plan, and it is expected that when the time comes for reorganization they will adopt the plan in force at Buhl.

Cow Testing

Progress in the Western States

Dairymen in the western state are to be congratulated for their progressiveness, as shown in the manner they have taken up the cow testing association idea, says J. E. Dorman in charge of the western dairy investigations of the U. S. department of agriculture. Four years ago there were only two active associations in this territory. On December 1, 1916, there were 42 strong associations with a membership of about 1100 dairymen and with approximately 21,500 cows on test.

Following is a list of the number of active associations in each of the western states on December 1, 1916:

Oregon	17	Montana	1
Washington	16	Wyoming	1
Idaho	2	Colorado	1
Arizona	2	Utah	1
Nevada.	1		

The dairy division of the bureau of animal industry, U. S. department of agriculture, reports that the number of associations in the United States on July 1, 1916, was 346, and that the number of associations during the year ending July 1, 1916, increased 164 per cent over the year before. The reports show that the increase in the western states was 228.5 per cent.

While the greatest number of associations are in Oregon and Washington, the other western states are fast becoming interested. Of the seven states in the United States that organized their first associations during the past year, three were western states, namely, Idaho, Montana and Arizona. Since July 1 Wyoming has organized one association. It is interesting to note that the state of Washington has increased the number of associations from one to 16 during the past year.

Dairying

Sees Increase in Morrow County

The Morrow County creamery at Heppner, Ore., opened last May, with J. M. Morgan, a graduate of the O. A. C., who already had working experience in a creamery, in charge. Mr. Morgan reports a slow, but steady increase in dairying ever since the creamery opened, although there is some decrease in the output with winter weather. A few of the largest dairymen receive cream checks of $75 or more each month, but far more have small dairies, bringing about $25 a month. Mr. Morgan says dairy cows do well in both the valley and on the uplands, and while not decrying wheat growing, especially during these times of high prices, he predicts that dairying is bound to grow. Many dairymen now disk in wheat or bald barley with their alfalfa each season. The disking is good for the alfalfa, and the crop makes an almost perfect ration if fed liberally, which it is sometimes hard to get new dairymen to do. H. A.

Bitter Milk

Sterilizing Small Quantities

To the Editor of the Farmer: Quite frequently I have noticed requests for a remedy for bitter milk and so thought I would tell you what my experience has been. When one has a large amount of milk to sterlize it would be quite on inconvenience, I fancy, but with one or two cows it causes little or no trouble. We were troubled in the same way as A. O. S., Oroville, Wash., November 16 issue. We were living in the city and our cow was a beautiful Jersey. We could seem to do nothing to change the bitter milk. It did not seem to be bitter, however, until standing a short time and the cream was so bitter we could not use it. We tried change of feed and every thing, but it did no good, so one day I set the pail with the milk in it on the stove and heated it almost to the boiling point, then strained it. The bitterness was all gone. I kept it up and had no more trouble with either milk or butter. The butter came quickly. As I have received so many good things and valuable suggestion in the veterinary columns of your splendid paper I felt as though if these few words can relieve some one I would be glad to submit them.

MRS. J. W. GREER.

Sunnyside, Wash.

AN OREGON JERSEY.

This grade Jersey cow belongs to A. C. Westcott of Washington county, Oregon. She has made over 700 pounds of butterfat in a year of testing. If "handsome is as handsome does," she certainly is a beauty.

Takes a Squint

At Dairying; Favors Common Cow

(Continued from page five.)

known in this community, was engaged in the dairy business near Boise. He had plenty of capital and large experience in business and live stock industry. He bought the best dairy stock to be had. His cows were record breakers. He furnished his dairy with modern equipment and we know George Leighton is thorough in all he undertakes. Well, he has sold his dairy and quit because it did not pay.

A little more than a year ago Pfaffel and Fulkerson of Meridian closed out one of the biggest and best equipped dairies in southern Idaho. The men I have mentioned are all of the 300-pound class, but they were failures in the dairy business.

We have a 400-pounder here in the Payette valley in the person of Mr. Boomer, who recently stated in the columns of this paper that his dairy does not pay.

Now, I visited a dairy in Oregon not long ago where a man is milking 30 common range cows. I don't believe there is a cow in the bunch that will produce 180 pounds of butter fat—he has never tested them—but his bank account is growing. I can mention a dozen dairymen who are making money with ordinary cows. It may be a question of education and it may be a question of common sense.

Mr. Langdon estimates the value of the labor incident to the keeping of a 20-cow dairy at $730 a year. He surely doesn't expect to use a man with much "gumption." If Mr. Langdon can hire "300-pounds" men in Washington for $730 a year they are cheaper than they are in Idaho.

Well, to resume, Mr. Langdon says "It does not pay to keep a cow that does not produce at least 300 pounds of fat." If 180 pounds is the average there must be a lot of cows below the 300-pound notch. What does he propose to do with the "boarders?" Sell them to his neighbors? Surely not. He must mean to send them to the shambles. That would reduce the dairy products of the country fully 75 per cent. Milk and butter and cheese are already pretty high. What would be the price if production were cut 75 per cent? Fine philosophy these educated dairy managers are advocating. I would say a better thing to do is for the man who can not make anything less than a 300-pound cow pay to go out of the business and turn their stock over to men with less education and more knowledge.

Now, dear reader and patient editor, maybe I have made a mess of this letter. I am sorry we have not more 300-pound cows in the hands of practical men, but they are not very plentiful, there are not enough to go around. We can not afford to kill off the cows we have until we can replace them with better ones. The man who advises you to kill old "Brindle" doesn't intend to furnish you milk for the babies any cheaper than old Brindle is doing it. If you kill off your common cows your high-toned neighbor with pedigreed cows won't reduce the price of milk. Get all the education you can, but don't forsake wisdom.

D. W. AINEY.

Payette, Idaho.

One Good Farm Paper.

Speaking of the sale of the Northwest Farmer, and its consolidation to The Washington Farmer, the Mount Vernon Argus says:

"One of the ills of the farm publication business, it is pointed out, is the multitude of papers endeavoring to cover the same field and do the same work. Farmers and dairymen become burdened with so many publications, all of the same or of similar character, that they find time to read but few of them. With Washington's sparsely settled rural districts, one good farm paper, carefully and intelligently edited, should be sufficient to answer all requirements."

Apple Crop Is All Stored.

W. L. Mason, an upper valley orchardist of Hood River, Ore., who has been handling the fruit of a number of neighbors, says that practically the entire crop of the upper valley district has been moved either to market or to local storage terminals.

New Church for Pullman.

The construction of a new church edifice is being considered by the federated church at Pullman, Wash., and already $6000 toward the $10,000 required has been subscribed. No steps will be taken toward the construction of the building until the entire amount is available, but it is thought that no trouble will be encountered in raising the remaining $4000. The church heads plan for a building that can be used for a community social center, to be open at all times for the use of its membership and others.

Chinese Eggs Arrive.

Chinese eggs have begun to arrive at Seattle. The shipment consists of 500 cases and is a part of a large consignment received at Vancouver, B. C. As soon as delivered on the dock at Seattle this shipment fell into the hands of Uncle Sam's alert pure food officer, who is reported to have given the eggs a passable reputation.

Young Hogs

Dressed Out 247 Pounds Each

T. J. Matlock of Heppner, Ore., on December 15 killed two pure-bred Poland China barrows and two sows, all farrowed April 2, that averaged 247 pounds dressed. The largest one dressed 272 pounds. At the same time Mr. Matlock killed twenty-one good, high-grade Poland Chinas, a little over a year old, that did not dress quite so heavy. Mr. Matlock bought as his foundation stock two sows from Thomas Brunk, the well-known Salem breeder, that had won first and second prize in their class two years in succession at the Oregon state fair. They also were in the herd that won first for get of sire and produce of sow. Added to this show ring record is the fact that they were personally selected by W. O. Minor, than whom there is no better judge of Poland Chinas, even if he is best known as a Shorthorn breeder.

Mr. Matlock was fortunate in having a litter of 11 from each sow the first time, so that his herd has built up rapidly. Mr. Matlock's pigs have had plenty of skim milk, along with other feeds that have grown them well, and he now has a lot of young stock, both boars and sows, that any breeder in the northwest might be proud of. He has recently purchased a new boar—one that Mr. Brunk had selected to show. Being not related to his present herd, Mr. Matlock will breed him on his young sows and keep the quality of the herd up to its present standard or even better, if possible.

Mr. Matlock was for many years a breeder of horses. He does not expect extremely quick sales or big prices now, but believes it will not be very long until the hog business is again showing big profit. By having pure-bred or high-grade of the best quality for killers he expects to show a profit both from the breeding and market end of the business. H. A.

Cost $9,000,000

Last of Foot and Mouth Disease

During the fiscal year the United States bureau of animal industry succeeded in stamping out the last of the foot and mouth disease remaining in the country from the outbreak of the fall of 1914. This outbreak cost the federal government and the states approximately $9,000,000 for the expenses of the campaign against the disease and the reimbursement of owners for cattle slaughtered. Large as this amount is, however, says the report, it is trivial compared with the colossal damage that would have been inflicted if the disease had escaped control and had become permanently established in the United States as it has in some other countries. Perhaps the most important step needed to complete the preparation of the whole country against possible future outbreaks of this or other contagious diseases, it is pointed out, is for all the states that have not already done so to pass laws, create or improve organizations, and make appropriations for dealing effectively with contagious diseases of animals.

Veterinary

Dr. S. B. Nelson

I feed my pigs cooked offal from a slaughter house with an occasional feed of shorts. They grow to weigh about 150 pounds and then get lame in their hind parts and in a day or two are unable to walk and soon die. Their hind parts seemed to be paralyzed. Is there something short in their feed? They get plenty of fern roots and grass. A. D.

Buckley, Wash.

Supposing that you try taking your pigs off the fern roots and if necessary feed them alfalfa hay as roughage instead, also giving them the opportunity to get grass as before. I do not know that there is anything in the well cooked offal from slaughter houses which would cause the trouble. I think you would get better results if you give them a certain amount daily instead of giving them an occasional feed of shorts. I do not believe that that is the proper way to feed the pigs. The fact that you do not have any trouble until they reach about 150 pounds would indicate that the trouble is a chronic one growing slightly worse day by day, and you not noticing anything about it until it gets so bad that it shows itself in the lameness which you mention.

Please advise me whether ground gentian root is a good condition powder. I have been told that for horses that are run down in condition that it is excellent. B. S. G.

Govan, Wash.

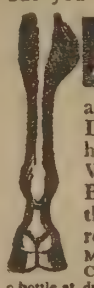
Ground gentian root is a very good adjunct to a condition powder. You should add other ingredients to it as gentian root is only a very mild liver tonic. Supposing that you use four drams of gentian root, one dram of powdered iron, five grains of powdered nux vomica, two drams of powdered ginger and four drams of powdered fenugreek. This is sufficient for one powder and should be given once daily for from 30 to 60 days.

I have a colt coming two in the spring that has a large swollen place in his left hock. I suppose it was strained in some way. It has been there for about three months. G. R. B.

Touchet, Wash.

Your description of the colt's trouble is not clear, whether the swelling is on the inside and just at the lower part of the joint, it might mean a blood spavin. If it is behind and above the hock, under the tendon, it would be a thoroughpin. If it is as I suppose, a trouble with the joint membrane, it is rather a serious matter and I would advise you to consult one of your local Walla Walla veterinarians, because I think that you will get better satisfaction from their advice after they have seen it than I can give you.

Would like to know how to get rid of warts on heifer's teat that will come fresh in May. Two of the warts are very large; can not tie a thread around them. F. S.



La Center, Wash.

Apply the following prescription after milking, morning and evening, to the warts on the teats: Chloral hydrate, 1 1-2 drams; acetic acid, absolute, 1 1-2 drams; salicylic acid, 1 dram; spirit of ether, 1 dram; collodian, 4 drams.

Many Women Sailors.

There are many women sailors among the Finns and Norwegians.

With Rig or Saddle Horse

We feel sure there are many of our readers who would like to earn some extra cash during the winter months.

We will pay salary to farmers with rig, saddle horse or automobile.

We will not consider an applicant who does not live on a farm.

We want to hear only from those who will be willing to give our proposition a fair trial for at least a month and who will put in good hard licks for good pay. This work isn't easy; but you can do it and earn a good salary during the winter months, without neglecting your farm chores—without being away from home more than a few hours each day.

We give you full instructions and the right kind of help.

You will be able to earn a salary of from $25 to $150 per month or even more, dependent upon the amount of time and effort you can give to the work. Salary check will be sent promptly at the end of each month.

In writing us tell whether married or single, whether you own or rent your place and give the names of two merchants with whom you trade.

There isn't any red tape about our proposition, but we must know something about those workers we put on our payroll to receive a monthly salary check.

If we get two or more applications from one neighborhood, the first will be given the preference in making our appointment.

If you want a good salary proposition for the rest of the winter, don't wait till tomorrow to write us, but send your application today.

If not interested personally in the above proposition, why not get some neighbor or friend in touch with us at once who you think will appreciate an opportunity to make several hundred dollars during the winter months. You will be doing both him and us a favor.

Address your letter to Publisher The Washington Farmer, Review Building, Spokane, Wash.

Get Rid of Worms!

Many animals, especially hogs, are troubled with worms. When your hogs are unthrifty, you hear a little cough now and then, suspect worms.

Dr. Hess Stock Tonic

Keeps Hogs Healthy **Expels Worms**

So sure am I that Dr. Hess Stock Tonic will keep your hogs healthy and expel the worms, that I have authorized my dealer in your town to supply you with enough Tonic for your hogs and, if it does not do all I claim, just return the empty packages and get your money back.

My Stock Tonic is not a feed, but a true conditioner and tonic, highly concentrated, which contains blood purifiers, laxatives and drugs which are powerful worm expellers. Feed in small quantities, watch your hogs improve.

NEVER PEDDLED. SOLD ONLY BY DEALERS.
28,000 reliable dealers in U. S. handle it. Why pay the peddler twice my price?

25-lb. Pail, $2.25; 100-lb. Sack, $7.00

Smaller packages as low as 65c. Valuable stock book mailed free, if you write for it.

DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Poultry Pan-a-ce-a conditions fowls, makes hens lay and is a great help at moulting time. Valuable for chicks, for pullets starting to lay and for all grown fowls. Costs a penny for 30 fowls per day. 1½ lbs., 25c; 3 lbs., 50c; 7 lbs., $1.00; 25-lb. pail, $3.00. *Guaranteed.*

Dr. Hess Instant Louse Killer A reliable lice killer, very quick acting. For use on poultry and stock. Use by dusting and sprinkling. Destroys bugs on cucumber vines, cabbage worms, slugs on roses. In handy sifting-top cans, 1 lb., 25c; 3 lbs., 60c. *Guaranteed.*

Write Dr. Hess about any sick animal or live stock trouble, enclosing 2c stamp. He will advise you free.

The Motor Car
On the Farm

Care for the Tires in Winter.

Tires can be ruined just as easily in your own garage as when they are rolling merrily along the highways. Along about this time of the year a great many motorists take their cars out of commission and store them away until spring arrives. Letting a car rest on the tires during the winter storage period is the most reckless way of throwing away good money. If you decide to put your car away, it will pay you to take a few simple precautions that will save the cost of a good set of tires.

Firts of all, remove the tires from the wheels and thoroughly wash the outside of the casings with soap and water. This will remove all traces of oil. Then examine both the inside and outside of tires for bruises and injuries. After making what repairs are needed, wrap the tires carefully in a clean cloth—or perferably black paper—and then lay them flat in a cool, dark room. Then, too, the inner tubes should be removed from the casings, carefully cleaned off—then laid flat on a shelf in a dark place. Chemists lay great stress on the importance of keeping light away from tires.

If you decide to leave the tires on the wheels, then by all means, jack up the car enough to take the weight off the tires and leave just enough air in them to keep them tight and in shape.

Following these simple precautions will save you a lot of grief on the road when you start to drive again next spring.

Show Your Number Plate.

The laws of most states are very strict as to the placing of number plates on automobiles where they may readily be seen and read. This is for the protection largely of the scrupulous driver, and every driver or owner of a car should see to it that his number is plainly visible. Of course, if you violate the law and your number is not plainly visible, there is a greater chance that you will not get caught, but if you are a lawabiding citizen keep it in sight and help compel the nonlawabiding citizen to do the same.

Don't Stop Too Suddenly.

When you are running on foot as fast as you can, do you stop suddenly? Not by a jug full. You stop gradually. Do the same with your auto. Remember that the auto has bones and ligaments and muscles in one form or another that may be strained by sudden application of the brake. Bring your car to a stop slowly.

SERVES HOT LUNCH
Sumas School Adopts New Plan.

After considering the matter for some time the school authorities of Sumas, Wash., have adopted the plan of serving a hot lunch at noon to those pupils who are obliged to bring their lunches from home. The meals will be cooked and served by the domestic science department. Those who are able will pay 3 cents per meal, and those who are not able to pay will be served free. Tickets will be given to all pupils so that no one will know whether any child is or is not paying for his meal. As the law does not permit the school board to use funds for this purpose an appeal is made to the friends of the school to donate potatoes, carrots, cabbage, turnips, parsnips, celery, tomatoes, corn and peas.

Cost of Irrigation.

The total cost of operation and maintaining the Sunnyside irrigation project for the fiscal year ended December 1 was $73,465, according to a statement by Project Manager R. K. Tiffany. This is $214 less than the total for 1915 and the canals carried water for an additional plant unit. The Sunnyside canal this year delivered water to 73,000 acres, as against 68,000 for 1915, and the cost for operation and maintenance was practically $1 per acre.

Corn Silage
How Many Tons Raised Per Acre

A. L. Russel of Walla Walla does not believe all the stories he hears about corn silage yields.

"When they begin talking 75 tons to the acre, as I've heard some men from west of the mountains do, I have to reserve my opinion," says Mr. Russel. "We've tried it out down on our place, and planting the corn as thick as it could be planted and worked well, with corn that ran better than 10 feet high and as high as 15, we didn't get a third that much. I should say that 25 tons of corn silage to the acre was a great big yield.

"Of course, there is one thing to consider," continued Mr. Russel, returning again to the yields on Puget sound. "Vegetation over there is more luxuriant in a way—it has more sap in it. But I believe that those big yields, overlooking for a moment their exact tonnage to the acre, are apt to produce a pretty acid ensilage; there is too much moisture and too little real grain in the mixture. I would want to have considerable grain to feed with that kind of roughage."

There are 20 cows in the Russel herd at present, their feed being principally good corn silage and alfalfa hay. Some grain is raised for market.

In answer to the question as to dairy profits, Mr. Russel stated that he believed that at present prices for milk the average farmer could keep cows at a profit. He says that in his part of the state a dairymen's association, formed for the exclusive purpose of securing better milk prices, has proved very successful.

"There is perfect harmony between the association members and the dealers," he explains, "but our joining together has enabled us to induce these retailers to raise the price to us, and so to their customers. They would not have done this without associated effort on our part."

BUYS 70 ACRES
Will Raise Wheat and Potatoes.

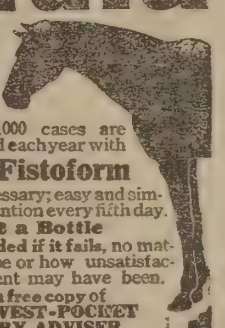
Henry Loomis of Ford's prairie has purchased 70 acres of the 140 acres owned by E. Goodrich, at the mouth of Lincoln creek, and will raise wheat and potatoes on the land. This piece of land is one of the choice tracts of that fertile section. Mr. Loomis has 54 acres, mostly in berries, in his home farm. Mr. Loomis is one of the progressive farmers of the county.

Guianan Fishing.

Instead of using nets or the conventional hook and line, the natives of Guiana shoot fish with bow and arrows. The arrow used is designed especially for this purpose and is about five feet in length, with no feathers.

Get All the Cream

YOU cannot expect to get all the profit from your cows unless you have a separator that skims clean. Why don't you make up your mind here and now to buy a **Primrose** or **Lily cream separator?** Then if your checks are not big enough, you will know that the trouble is with the cows, not with the separator.



The president of the Iowa Federation of Cow Testing Association says that of all the separators in use in his association, and they are many, the **Primrose** skims closest. It leaves less than one-hundreth of one per cent of the cream in the milk. The **Lily** skims just as close. Neither one wastes any cream. With prices of everything as high as they are now, to waste cream is little short of a crime.

Yes, you can buy separators for less money. You can also pay more. But you cannot buy a closer skimming machine, one that runs easier, or one that will skim clean for a longer time. Do not delay. The longer you put off buying a **Primrose** or **Lily** cream separator, the more you lose. Get one of these machines, and your separator troubles will disappear as if by magic. Drop us a card for catalogues and full information.

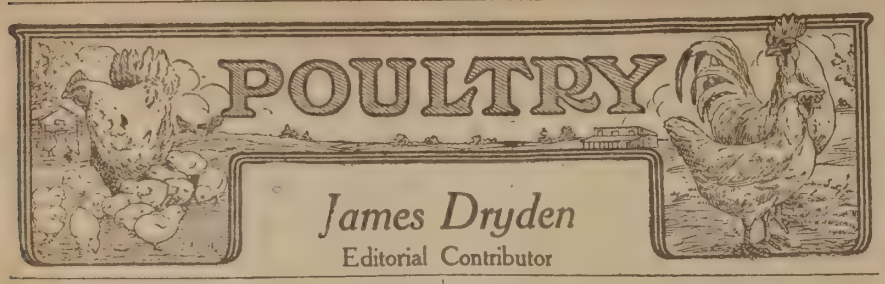
Here's Your Silo

Double Wall—"Air Tight"
Very Strong—Low in Price

Double walls with massive four-by-six studs make the H-L-F Silo a strong, substantial "air tight" building rather than a barrel. **One thousand in use**—owners everywhere praise it

Hewitt-Lea-Funck Co.
558 **Funck St., Sumner, Wash.**

Gentlemen:—Send me your big folder showing prices, terms, full information about H-L-F Silo and your special FREE ROOF offer.



Name.....
Town.....
R. F. D......*State*.....

Big Folder FREE—Shows Freight-Paid Prices

Single silos at carload prices—already starting to assemble cars for early spring delivery. **Silo actually costs you less than the common stave silos—many letters actually prove it positively prevents frozen silage.** Send now for big folder which gives all facts, letters from owners, names of owners near you. FREE ROOF with early orders. Learn now about this wonderful silo—coupon at left brings you the folder.

Idaho Poultry

Bring Profit to Their Owners

By D. R. HUBBARD.

The turkey industry has proven quite profitable to the people of the Kuna country, Idaho. A. W. Nelson sold $165 worth of turkeys, raised from three hen turkeys. Mrs. W. R. Gillen sold $294.23 worth of turkeys, own raising. Mrs. C. W. Green reports $295.44 from 140 eggs set. Mrs. T. W. Whitworth sold $275.75 worth of turkeys from four hens. Mrs. C. P. Langs sold $245 worth from four hens.

Chickens Also pay.

L. S. Randall reports $319 from sale of eggs on consumers' market in 12 months from 125 White Leghorns.

Mrs. H. Achenbach sold $313.73 worth of eggs from 125 Brown Leghorn hens during the same time.

The month of heaviest production was March. The lightest was June. February was second in cash receipts.

Live stock is increasing, sheep, beef cattle and dairy cows.

The country is settling up rapidly, farmers coming here from the middle west.

To Utilize Peat.

Spain is studying its large deposits of peat, with a view of utilizing the material for the production of both gas and electricity.

Loss of Chicks

Often Caused by White Diarrhea

By JAMES DRYDEN.

A large part of the great annual loss in brooder chicks is due to what is now known as bacillary white diarrhea or bacterium pullorum. This germ disease is transmitted from the hen through the egg to the chick. The ovaries of the hen become infected and there is no known cure, either for the infected hen or the chick. There is, however, a method of testing the hens to find out whether they are infected or not, and the test seems to be very accurate. One infected hen in the breeding flock may infect one chick, and that one chick may spread the disease among all the chicks in the brooder. The test can not very well be made by individual poultrymen, as it requires some bacteriological work which can best be done in the laboratory. The test, however, is simple and inexpensive, and it is believed that poultry breeders can well afford to have their flocks tested. If the breeding hens are free from the disease there should be no brooder mortality from it. This, therefore, removes one of the terrors in the rearing of chicks. Those who buy eggs for hatching and day old chicks would do well to buy, if possible, from tested flocks.

To assist the poultry raisers of the state, C. C. Lamb, extension specialist of the poultry department of the Oregon Agricultural college, will make tests of breeding flocks, under certain conditions, during the months of November, December, January and February. Poultrymen wishing to have this work done should write to him at once.

200-Egg Hen and Flock.

The unexpected is happening about as often in the poultry world as in any other world. Less than 10 years ago many poultry writers looked with skepticism upon the 200-egg hen. She was at least a freak and was worthless as a breeder. But since then we have had the 300-egg hen produced by a 200-egg hen, as was the case at the Oregon station. When the first 300-egger was announced she got a cold reception from these same skeptics—there was no such animal. Not many years ago it was published in books that 600 eggs was the limit of production of a hen in a lifetime; she couldn't lay any more. The Oregon station has four hens that have laid more than 1000 eggs and are still in condition to lay more. No one has yet acknowledged openly that a 200-egg flock or strain of hens is a possibility. A pen of Oregons at the Missouri laying contest last year averaged 231.8 eggs and each of the hens laid more than 200. Four other pens, sisters to the Missouri pen, from 10 to 25 in a pen, all averaged over 200 eggs. Pens of 50 and 60 at the Oregon station have averaged better than 220 eggs. If not an actual reality, the 200-egg flock is at least a possibility.

J. D.

Another Laying Contest.

T. E. Quisenberry, formerly director of the Missouri poultry station, has issued the first month's reports (November) of the American egg laying contest, which he is conducting as a private enterprise at Leavenworth, Kan., There as 120 pens entered. The following paragraph occurs in this report, which is worth considering: "Will the poultry breeders of the country never learn that they must hatch their pullets reasonably early if they are to lay high priced, winter eggs? There have been 120 pens entered in the American egg laying contest. The large majority of these birds are undeveloped and will not lay for 30 days or more. If those who are specializing in market eggs expect to make the most of their business their chicks should be hatched early enough so the pullets would begin to lay by November 1, or before. One pullet may not lay as many as another, but if the first lays eggs in winter she will likely be more profitable than the latter."

J. D.

Eggs in Cold Storage.

Reports from 238 cold storages show that their rooms contain 2,103,869 cases of eggs as compared with 3,984,534 cases in 254 storages on November 1. The 193 storages that reported holdings of December 1 of this year and last show a present stock of 1,794,740 cases as compared with 2,737,802 cases last year, a difference of 993,062 cases or 35.6 per cent. The reports of 215 storages show that the holdings decreased 40.6 per cent during November as compared with the decrease of 25.1 per cent during October, shown in our last report. Last year the holdings decreased 20.0 per cent during October and 31.2 per cent during November.

Pig and Poultry Clubs.

The pig clubs and poultry clubs organized among the boys and girls have shown remarkable growth and have contributed largely to the increase in the number of pigs and chickens in some states. The membership of the pig clubs is over 21,000 and that of the poultry clubs over 8500, both having more than doubled during the year.

Feeding Brooder Chicks

Successful Methods on an Oregon Poultry Farm

By JAMES DRYDEN

I have received a little folder on "How We Feed and Brood Baby Chicks" from the Walnut Crest farm, Newberg, Ore., owned by M. C. Wire & Son. Accompanying the circular was a note from Mrs. M. C. Wire, in which it is said: "I am sending you in this my first and only contribution to poultry literature." A good many of us could wish that our last, as well as first, contribution to poultry literature had as much merit. I have visited the Wire poultry farm several times and can vouch for the success of the methods of breeding followed on the farm, and I have understood that Mrs. Wire was responsible for this branch of the work. During the past season some 1400 good pullets were raised on this farm. The room brooder system is used, but the methods of feeding are applicable under different systems.

The following is taken from the little folder:

Nursery Food.

Nursery food is prepared as follows:

Dried bread crumbs, two parts.

Rolled oats, two parts.

Hard boiled egg, one part.

Into this mixture put a little buttermilk, just enough to moisten the crumbs slightly, not enough to wet them. Add a little sand and fine ground bone. The bread may be saved for months, dried, ground and kept in tight pails. The eggs should be cooked just before using, and ground, shell and all, in a grinder. A cheap quality of rolled oats may be obtained.

First day.—When the room is at the proper temperature, 90 degrees, the buttermilk and boards in place, and the birds 48 hours old, they may be put around the stove.

Soon the chicks begin drinking the buttermilk, and this is their first feed. In about an hour papers may be laid around and a little nursery food scattered upon them.

We feed the chicks five times a day.

Second day.—A little chick food should be mixed with the nursery food, also a little scattered in the straw. This should be done every day to teach them to scratch.

Third and fourth days.—Put a little more chick food into the nursery food.

Fifth day.—One feed may be entirely of chick food scattered in the straw.

Sixth day.—Give two feeds of chick food.

Thereafter all but the morning feed may be of chick food. Use the nursery food in the morning as long as your eggs hold out. The longer it is used the better.

Water.

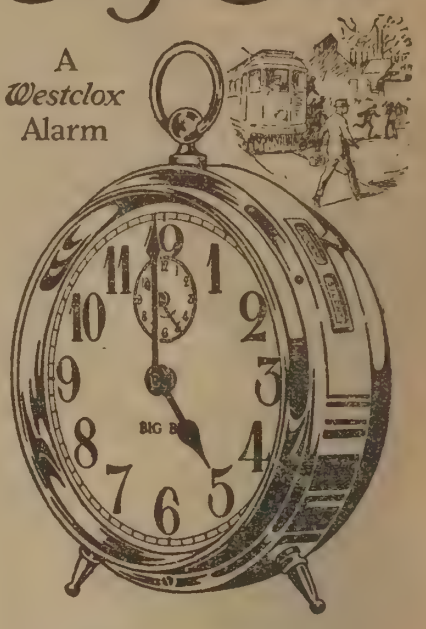
Some fountains of water should be put into the room the second day and always thereafter. While the birds are small care should be taken to take the chill from the drinking water.

How Much to Feed.

Give at one time only as much nursery food as the birds will eat in two or three minutes. Half a thimbleful of chick food for each bird is enough to feed at a meal for the first week. A slight increase should be made from the beginning of the second week. After two weeks gradually substitute corn, cracked fine, cracked wheat and broken oat groats for the chick food.

Dry Mash.

Little troughs three to five feet long should be made. Into these, from the very first, put bran and a little granulated chick charcoal. Gradually add to the bran fine ground meal of oats, barley, wheat or corn or a combination of any two. A very little salt should be put in. The finely granulated bone, which is very important, may be fed in this dry mash. Care should be taken not to increase too rapidly the ground meals in the mash.



The first day mash consists of bran. The dry mash for the birds on range after six weeks is composed of

Six parts bran.
One part wheat and oats, ground fine.
One part corn meal.
One part soy bean meal, or oil meal.
A little salt.
Charcoal.

The heavier part of the mash may be gradually increased for the first six weeks up to the limit given in the above formula.

Big Ben

A Westclox Alarm

FIVE A. M. for factory men who beat the time clock at the works.

Big Ben gives 'em their breakfast call long before the whistle toots. They used to pound the pillow right up to the last dot—until they learned a better way—as the paymaster soon found out.

Give Big Ben a trial, *yourself;* make *your* roll-over-time pay.

You'll like him face to face. He's seven inches tall, spunky, neighborly—downright good.

At your jeweler's, $2.50 in the United States, $3.50 in Canada. Sent postpaid on receipt of price if your jeweler doesn't stock him.

BIG TREE LUMBER

DIRECT FROM HEADQUARTERS

Big Tree Lumber—Old-growth yellow fir and red cedar cut from trees six feet thick. Send carpenter's list today for freight-paid price.

Hewitt-Lea-Funck, 458 Funck St., Sumner, Wash.

Egg-o-hatch applied to eggs during incubation strengthens the chick and weakens the shell. It supplies free oxygen, absorbs carbon dioxide and makes brittle and porous the anima l matter of the shell. The biggest thing ever offered to poultrymen. 50 test hatches show average of 96 per cent for Egg-o-hatch eggs and 81 per cent for eggs not treated, **right in same machine.** Send 10 cents for sample, for 50 to 100 eggs. Full size package, for 600 eggs, 50 cents postpaid. Booklet free.

GEO. H. LEE CO., 253 Lee Bldg., Omaha, Neb.

PFILE'S 65 VARIETIES farm-raised Land and Water-Fowls. Eggs in season. Incubators. Illus. Catalog and "Grower's Guide," 2c. An honest deal. Write today. HENRY PFILE, Farmer-Poultryman, Box 720 Freeport, Ill.

In answering advertisements don't fail to mention this paper.

WHEAT, ALFALFA

and other grains yield more where a perfect seed bed is prepared. The **Western** pulverizes, packs and mulches—makes a perfect seed bed at one operation. Saves seed, time and horse power. Is especially adapted for breaking crust on winter wheat or other grain or in orchards after irrigation or packing rains. It forms the hardest crust into a granular mulch without hurting the grain, and prevents evaporation.

Western Pulverizer, Packer and Mulcher 3 Machines in 1 made in 8 sizes, 1 and 3 sections, prices $20 and up. We want every farmer to have our free catalog before buying a roller or packer. It proves we can save you money and have far the best machine. Contains full description, price direct to you, letters from many farmers proving its advantages over other makes, and much other valuable information. Send for it today.

WESTERN LAND ROLLER CO., Hastings, Nebr. Box 200

Bees in Yakima Valley

Net Profit of $75,000 From 25,000 Colonies

By D. G. SUTHERLAND

The twenty-seventh annual meeting of the Washington State Beepeepers association met in the commercial club room at North Yakima. About 75 people were in attendance. The annual address was delivered by the president, J. B. Ramage of North Yakima. It was shown that there were 25,000 colonies of bees in the Yakima valley alone, bringing in a net profit of $75,000 per year. It was estimated there were 100,000 colonies in the state. For the last five years the average yield per year for the entire state was 30 pounds per colony.

The following officers were elected for the ensuing year: J. B. Ramage, North Yakima, president; J. B. Espey, Chehalis, vice president; G. W. Bolin, White Swan, secretary; L. H. Hart, North Yakima, treasurer, and W. H. Tucker of Prosser, corresponding secretary. It was voted to buy a membership in the commercial club and William Johnson of North Yakima was named as their representative in the club.

State Association.

Anson S. White in his paper stated that this was one of the first states in the west to organize an association, being in the year 1894. He was one of the pioneer members and Legh R. Freeman, for many years publisher of the Freeman Farmer, was its first secretary. Mrs. Freeman, his wife and present publisher, was present and is still an active member. It was interesting to note the changes in the industry.

From the time the bees had to depend largely on wild flowers for their existence the Yakima valley now has one of the greatest alfalfa and fruit growing districts in the world, making it an ideal place for bee culture.

William Johnson, foreman of the Congdon orchards, spoke on bees in the orchard. He considered them an absolute necessity to the best yield of fruit. He did not believe they were responsible for the spread of blight as was generally supposed. He said bees never gather nectar from the blight. He recommended the delay of the first arsenate spray till the petals of the blossoms had mostly fallen, that gives the bees a chance to pollenize the bloom and the later spray was as good for the trees and no injury would occur to the bees.

G. W. Bolin of White Swan spoke on honey plants, touching the different varieties of bee food available in this state.

Marketing Honey.

An interesting paper was read, written by Frank C. Pellett, inspector of apiaries from Iowa, on the question of marketing. He said the bee men were largely to blame for the high freight rates on honey. It was on account of leaky packages which made the railroad company liable not only for loss of honey but other goods damaged. He cited one instance where a valuable consignment of silks was completely ruined by the leakages of honey, making the railroad company pay not only for the honey but for the silk as well. He believed whenever the railroad company knew honey would be so packed as to relieve them of the danger of damage, then the rate could be reduced. The size of the package must fit the trade. Neatness, attractive package and absolute cleanliness were the big factors.

H. C. Lucas, president of the Yakima Trust bank, North Yakima, gave a talk on bee keeping from a commercial standpoint.

Like Human Family.

Representative Mrs. Wallis Williams of North Yakima spoke on legislation needed. Both she and Representative W. P. Sawyer and Senator D. V. Northland assured the association that if they could get together and frame such a law that would protect them from foul brood they could not see anything in way of the passage of any reasonable and just law. One of the reasons why a woman should keep bees is that she needs something to break the monotony. A woman has the same things to do over and over again, one day after another. She needs something to take her mind off her household duties. If she goes out to hive a swarm of bees her mind is as completely taken off her household duties as if she had taken a trip to Europe. You can learn practical lessons from bees. They remind you of the human family. They are good housekeepers, they have their regular nurses, they tend strictly to business and like the human family the female does the work.

The association voted unanimously asking the county of Yakima to appoint a county agriculturist. The federal government has set aside $15 for the aid of bee culture.

Professor W. S. Thornber assured the association that they should have their share of assistance from the department whenever occasion demanded it. It was voted to establish a bureau of information for the purpose of getting a more uniform system of selling and to keep posted on supply and demand.

Receives High Honor.

Ruel Chandlee, a 15-year-old student at the Ridgefield grammar school, received high honors from T. J. Newbill, state organizer of boys and girls' clubs, as having the best garden of any club member in the state of Washington.

While inspecting young Chandlee's garden late last summer, prior to the Clarke County Industrial School Fair, Professor Newbill and W. E. Dudley, country school superintendent, secured a number of photographs of his garden for the agricultural department at Washington, D. C., and for the State college at Pullman, Wash.

Ruel entered a number of his garden products in the first Clarke County Industrial School fair, which was held at Ridgefield September 15, and as a result captured five prizes.

Fur Is Valuable

Winter Season Is Time to Trap

This is the season when furs are best, and therefore will bring most profit to the trapper or hunter. Not only is this true, but it is the season of the year when there is more time to be given to trapping and hunting, which may, if properly done, be made to pay in both money and sport.

So varied are the natural conditions in the northwest that many fur bearing animals of widely differing classes may be found, from bear to weasel. There are wildcats, lynx, mink, skunks, muskrats, coyotes, bear and others, some one at least in almost any community.

The muskrat is most common, probably, and is in fact a fur bearing animal of value. There are fun and pocket money to more boys in trapping the muskrat than any other one animal in the northwest. And he is easily caught. There are many ways to take him.

One plan recommended is to sink a barrel in the ground just a few inches from the water's edge where muskrats are known to live. Fill the barrel to within about eight inches of the top with water and place pieces of carrots or other like bait on floating shingles in the barrel. Also scatter similar bait about outside to attract the muskrat and lead him to the barrel. Trappers report success by this method. They declare the muskrat will go into the barrel after the bait and find himself unable to climb out.

A more common and less troublesome method is to use the common steel trap. Set it in the shallow water where the rats live. Place the bait on an inconspicuous stick about five inches above the water at the side of the trap. The rat will undertake to get the bait and get onto the trap while doing so.

Care should be taken to skin the animal without cutting the skin. It also should be stretched like a mitten over a board just the size and shape to hold it in its natural shape. The value of fur depends to a great extent on the condition it is in.

Seed Grain

Supply for Sowing Next Spring

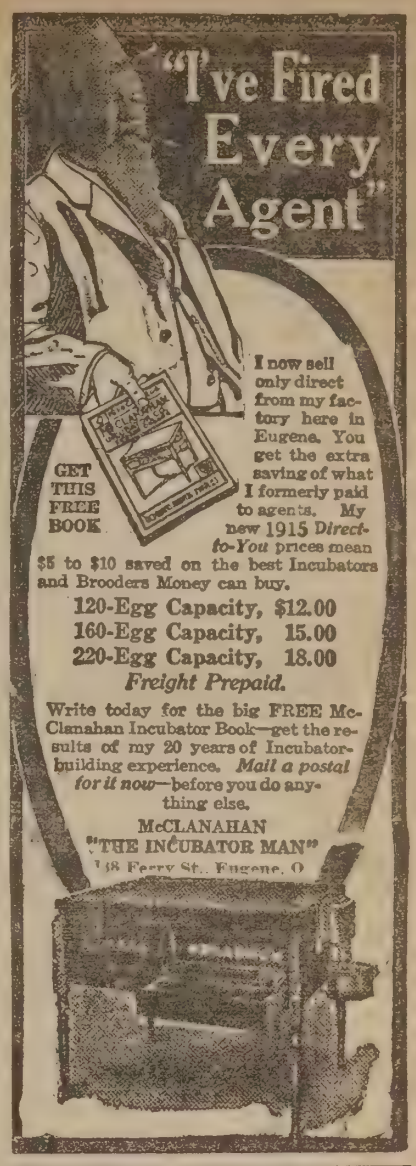
In order to insure themselves a supply of good seed grain for sowing next spring, farmers are advised by the United States department of agriculture to bear in mind that the seed crop of 1916 in the spring wheat states of the upper Mississippi valley was badly injured by rust and other diseases. Such grain is not good for seed purposes.

In the states of Washington, Oregon and Idaho the spring wheat crop was large and the grain of excellent quality. The tempting prices for wheat should not induce the farmers to sell what should be kept for seed because no seed varieties adapted to this section can be obtained elsewhere.

The barley crop for the past season in the United States was for the most part of very good quality and no unusual methods of precaution need be taken in seeding the 1917 crop except in parts of the northern Mississippi valley.

Apple-Growing in Brazil.

According to reports there are only eight acres in Brazil planted to apples. The fruit is selling there now at $1 per dozen. The Brazilian government gets busy and has selected eight fruit experts from the Pacific coast to establish the apple industry in that country, offering a salary of $2400 a year with transportation and expenses. O. F. Clawson, late Chelan county Washington fruit inspector, is one of the chosen experts, and accompanied by his wife, will sail from New York in a few weeks for Rio De Janeiro, Brazil.



Buy Land for Fair.

The trustees of the Wahkiakum Fair association, at a meeting held at Skamokawa, decided to purchase an acre of land from Alex. Moe for $300, to claim the same at once and begin the erection of a two-story building 30x80 feet, with 16 feet studding. The lower story will be used for the vegetable exhibit and the upper room for the school exhibit and fine arts.

The officers elected are: President, H. L. Wiester; vice president, Chris Sorenson; secretary, M. S. Hougen; treasurer, M. Gorman, reelected.

Coming Events.

January 8-9—Idaho Honey Producers' association, Twin Falls.
January 10-13—Interstate Poultry club, Hillyard, Wash.
January 8-17—Idaho State Seed Growers' association, Pocatello.
January 8-17—Idaho State Dairy association, Pocatello.
January 8-17—Idaho State Swine Breeders' association, Pocatello.
January 8-17—Idaho State Live Stock association, Pocatello.
January 17—Idaho State Cattle and Horse Breeders' association, Boise.
January 18-20—Madison County Poultry and Pet Stock Show, Rexburg, Idaho.
January 22-27—Annual farmers' week, University of Idaho, Moscow.
January 30-February 1—Idaho State Horticultural Association, Boise.

The Life of Chilean Nitrate Deposits

Better Families

More Desirable Than Better Fruit

BY GRANVILLE LOWTHER.

We are not wrong in our efforts to grow better fruit, but we are wrong if we think the growing of better fruit is the chief end to be desired by the orchardist. It is not fruit, it is life for which we are struggling. It is not better crops, better poultry, hogs, cows or horses, but human life that we are here to bring to perfection. Of course, the word "perfection" is a relative term, but I am using it in the sense in which the farmer uses it in relation to his products. Some of us learned an old catechism which taught that the chief end of man is to fear God and keep his commandments. This may be true in so far as it concerns a means to an end, but it is not the end within itself—all labor and study and struggle and acquirements and religions are helpful as they aid us to reach the chief end of life, which is the development of character or of life itself. The ends for which all civilization exist is better life—more intelligent, greater, truer, better adapted to grapple with the conditions of the present—with unbounded ambitions and hopes for the future.

The president of the Washington state university is right in the contention with the football crew, that character is the aim of college and university life. This is just as true of farm life, mercantile life, professional life or any other honest occupation as it is of colleges and universities.

Better poultry, better hogs, better sheep, cows, horses and crops, larger farms and a larger business are so many contributions that should lead to better living. If they do not, we have missed the mark. Better living in the truest sense means better families and ultimately better men and women.

What Is Better Living?

I do not mean by better living that there is to be more of the frivolities of life, more card parties, dances and fashionable dinners. Whatever of amusement, recreation and pleasure these gatherings may furnish, they are not of much value as developers of character. I mean better houses, better conveniences about the house; better books, better pictures on the wall, better furniture, better music, better means of travel, better clothes, better country schools, better country churches, with a higher tyye of ministers in their pulpits; better social conditions among farmers and their families—all of which will result in better environments for the bringing up of children.

No college or university equals in its influence of three to six years the influences of the home for the rest of life. No Sunday school teacher can do for the child in one hour on Sunday what the mother can do in a week. Of course, we need better teachers, but more than all, we need better fathers and mothers. We have given considerable attention to the improvement of conditions in our penitentiaries, charitable and penal institutions. But better than this is to have better conditions in the homes, which will tend to make these institutions less necessary.

Is life a struggle to grow more fruit? To make more money? To buy more land on which to grow more fruit, to make more money? To buy more land? To grow more fruit? To make more money to buy more land? If, then, we have spent our lives toiling, saving and slaving, depriving ourselves and our families of the comforts they have earned, we die and leave it all, how much are we ahead?

If there is a future life it is probably conditional—not on what we leave behind us, but on what we take with us. Now what do we take—except our characters, ourselves? If we take a life shriveled, stunted and dwarfed we can not enjoy what we would if we were educated, disciplined, developed, and able to appreciate the best things. How can one who has not learned to enjoy the best things in this life enjoy better things in the future life?

A man said to me some time since: "I know I am making a slave of myself in order to enlarge my business, but some day I am going to stop and take it easy, and enjoy life." Enjoy what? Enjoy literature—he is losing his taste for it every day by not giving himself time to read. Enjoy music? He has never developed a love for any kind of music except ragtime. Enjoy society? His manners are so uncouth and his etiquette so bad that his friends are ashamed of him. Enjoy art? He would not know a production of the old masters from a chromo. Enjoy travel? He will have lost all his interest in things not related to the business to which he has given his life. Enjoy rest? Observe the unrest of the old men who have left their farms and moved to town to spend their remaining years. I would not waste money nor spend it unwisely, but money invested in making better homes and better families is invested in the highest things.

There are many good and bad institutions in this world depending largely on how we use them; for they are all designed for our good; but the home more nearly touches the extremes of happiness and misery, which we generally call heaven and hell, than any institution on earth.

A Million-Dollar Waste

"Revive some of our old enthusiasm," is the advice of a Cashmere orchardist, who believes the fruitgrower is losing his grip, and that the industry is suffering heavy losses as a consequence.

This is the fourth article summarizing the addresses and discussions at the apple conference held in connection with the ninth annual apple show in Spokane.

How to save a million dollars to the fruit industry each year in the northwest was the subject treated by J. F. Sprague, an orchardist of Cashmere, Wash. He declared that through careless methods in caring for trees and the fruit, both before and after picking, waste had increased from not more than 5 per cent a few years ago to 10 or 15 per cent now, running to as high as 25 per cent in individual orchards.

While his treatment of the subject was primarily for the benefit of the commercial orchardist, the remedies he offered apply as readily to the home orchard, and in the latter the waste is believed by many to be even greater proportionately than in the commercial orchards.

"Let's begin at the beginning," he said. "Revive some of our old enthusiasm by more attention to our apples and less to our automobiles, get a fresh grip on our courage and we can lessen this waste."

His paper on the subject in part follows:

"Elimination of waste must commence in the spring and be kept up during your growing season. The principal causes for rejection of our fruit from the extra fancy grade are as follows: Worms, scale, scab and physical injuries caused by careless handling during the growing and harvesting period.

Spray Systematically.

"There is only one way to eliminate worms, scale, scab and other diseases, and that is by careful and frequent spraying. In the Wenatchee valley in the last six years the character of the attention given to the growing crop has deteriorated with the resulting effect that our percentage of culls or waste fruit has increased several hundred per cent. In 1910 the crop of the whole section might have averaged two to three per cent culls. Today from 10 to 15 per cent would be a fair average.

"Another cause for our many defects is physical injury. Increasing acreage and decreasing prices has meant an undue hurry in the picking and unnecessary violence in the handling of our whole product. In 1910 a grower would consider that if the laborer picked from 50 to 80 boxes a day he was doing a good day's work. Today people expect 80 to 100 boxes per day and 125 to 175 have been picked. The result of too much haste in picking means bruised fruit, stem punctures, broken skins, etc., all of which are defects that increase our waste and decrease our profits.

Pruning and Propping—"These two necessary procedures occur at widely different periods of the year, but they bear a close relationship one to the other. Neglected pruning or too light pruning means willowy trees, unable to carry a proper load." This means increased propping and every prop you put in an orchard means bruised and scarred fruit. By this I do not mean to say that propping should not be done, but I do think that a tree can be pruned so as to carry a fair load and that the result would mean less propping and that the tree would produce crops running into a higher percentage of high grade fruit.

Thinning—"The rancher's heart is very weak during the thinning season. He can not make up his mind to pull off those little, green promises of wealth to come. Light and inefficient thinning is responsible for limb rubs, bruised and poorly sprayed fruit. Two apples on one spur invariably mean an imperfect coating of spray to both apples, and one more little codling moth comes around as he will come and there is no safer spot for him to take than where the two apples touch.

"I do not mean to say that all waste can be eliminated by careful orchard practice, but I feel sure that the larger percentage of defects that cause waste occur during the growing period and that in all cases, prevention rather than cure is what we are looking for.

"We now come to physical injuries: One cause is sun scald. I have no documentary evidence to go by, but I have seldom seen a tree suffer from sun scald that was not too heavily laden. A load of fruit heavier than the wood can bear, pulls down the branch and exposes the fruit, which has no protection from the leaves, consequently sun scald. The cure is pruning, thinning and propping early, center propping preferred. Sun scald is an enormous injury in some sections, particularly to Spitzenburgs and Jonathans.

Careful Picking.

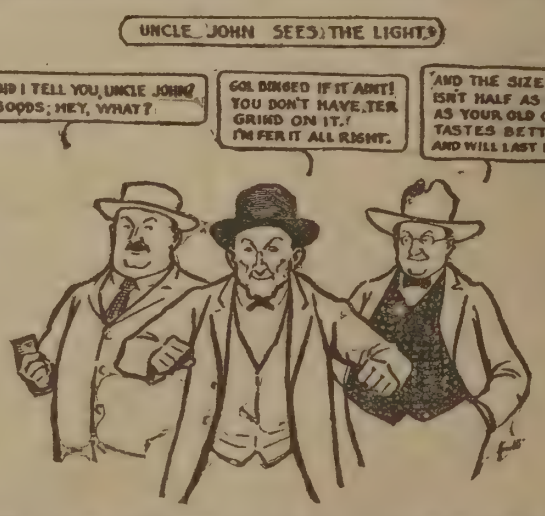
"No crew of pickers should be turned loose in an orchard without a good foreman, owner preferred, to watch and correct their mistakes. A waste that can certainly be corrected is caused by rough handling and careless or malicious picking. Where possible, picking should be done with gloves. Finger bruises, nail marks, deliberate or accidental, will in this way be eliminated.

"The only damage the fruit can receive during the haul from orchard to packing shed is from bruise or stem punctures. To eliminate these two causes in addition to careful handling get good springs on your wagons and have good roads. Good roads are of prime importance, and my advice to the orchardist who lives in a community that has not enough money to spare to make roads is to go out and do it yourself. The money and time is put in on the public road, but the benefit comes direct to your product.

"When I first entered into the apple game we hauled 75 boxes per load, two trips a day. Now, with practically the same equipment, we haul 140 boxes per trip, three and sometimes four trips a day.

Need Byproducts Plant.

"I am willing to admit that with the utmost care there will still be damaged fruit. Wind storms and hail storms occur; worms can not be altogether eradicated. Misshapen and poorly colored, undersized fruit will still be present, and the only way to tackle this situation is by the erection of a central byproducts plant supported by a whole community, irrespective of what their other affiliations may be. The railroads of the country by granting nominal assembling rates to a central point can make this profitable. They can do this with an easy conscience, as the manufactured product, whatever it may be, will increase their long-haul tonnage. Given this outlet, there will be no necessity of throwing away bruised or wormy apples nor to store at a loss overripe or undersized fruit that only becomes more and more unsaleable as time goes on. Also the temptation, which is at this time very evident, to lower the standard of our grades can be overcome. Evaporated apples, vinegar, cider and concentrated apple juice offer a wide field yet to be developed, and I believe a profitable future for the developer. To my mind it is not the waste now existing that is so appalling. The apathy and indifference displayed toward this condition are more appalling by far."



More School Grounds in Whitman.

Over half a block has just been added to the grade school grounds in Garfield, Whitman county, at an expense of $4000. Three residences upon the land will be removed and as a further enlargement of the school plot the city has taken the preliminary steps to vacate the street between the present school site and the newly acquired property. This will enlarge the school property practically a block.

Puyallup Pig Club.

The Puyallup Commercial club in western Washington will aid in organizing pig clubs for the boys and girls in the valley.

KEROSENE ENGINES
OTTAWA "LATEST" DESIGN
Durable, Powerful, Reliable, Massive. Built to last; to do hard, heavy work. Uses Cheapest Fuel. Pull ¼ to ⅓ horse-power more than rated. *3 Months Trial. Easy Terms.* Sizes 1½ to 22 H-P. Easy to start. No Cranking. No batteries. 10 Year Guarantee. Most practical engine ever built. Engine book free. A Postal brings it.
THE OTTAWA MANUFACTURING CO.,
1461 King Street, OTTAWA, KANSAS.

THE young fellows teach the old ones and the old ones teach the young—that's the way it is with W-B CUT chewing right along. Less chewing for feeble jaws, less chewing for husky jaws—but the big point is *satisfaction.* Never before has there been so much satisfaction in so *little a chew.* It's *rich* tobacco, W-B CUT is. It makes you feel sorry for the fellows who chew so much of the old kind for so little benefit.

Washington State Lagging Behind

Few Realize Importance of Sane and Progressive Irrigation Code

By GRANVILLE LOWTHER

There are few who realize the importance of a sane, equitable and progressive irrigation code in its relations to the wealth and development of the state of Washington. The legislatures of the states of Idaho, Oregon, Montana and Wyoming have so modified the old laws under which water was formerly appropriated as to meet the modern conditions of irrigation and the reclamation and settlement of their arid lands, while Washington still holds the old laws inequitable, antiquated and unadapted to the new conditions of western development.

Riparian Rights.

One impediment is the old riparian rights law, enacted in England several centuries ago and incorporated into the statutes of the United States in its early history. In this law it is provided that a person who owns land "bordering on a stream of water has a right to have the stream flow naturally and without changing it in quantity or quality or otherwise. Such owner is the proprietor of the bed of the river which adjoins his land and has a right to the use of the water flowing in the stream."

This statute was well adapted to the conditions that prevailed in England at the time of its adoption by that country. It may have been well adapted to the conditions that prevailed in this country at the time it was transferred to our statute books. These periods were before the days of large industrial or commercial interests. At that time business was transacted in a small way and mostly by individuals. It was before the days of large corporate interests; before the building of railroads, telegraph lines, transcontinental traffic, interstate commerce, large manufacturing interests, electric power or the irrigation of vast areas of arid lands. It is just as reasonable to operate the farm machinery of that early period in competition with modern machinery as to try to adapt these old laws to modern conditions. It is the ox-cart and neap hook civilization instead of the steam and electric. Yet the Washington legislature, in order to preserve rights that are based upon tradition rather than equity, has held up any progressive legislation on this question.

How Rights Were Obtained.

A few men with imagination and a keen scent for speculative values saw that the future development in this country would depend upon irrigation and electric power generated in the streams. They therefore "pussyfooted" it around in the mountains, canyons, gorges and rocky cliffs and purchased at a mere nominal sum lands adjoining the streams where it was easy to build dams, reservoirs and power plants. They also filed on the water flowing in the streams so that they became possessors for merely the filing fees, which in this state would not be more than $1 for each filing, of waters many times more valuable than the lands. In order to be sure that they got all the water they filed on more than the streams would carry. Professor Waller says that "If all the water on which filings have been made in the Yakima valley could be delivered it would cover the whole state of Washington 600 feet deep. Therefore the state gave them the water, without which the land of the irrigated or irrigable sections are of no value. I can buy lands not irrigated for $1 per acre. After development under irrigation I must pay from $100 to $200 per acre. The water is the thing of value and that was given away.

Holding Water Out of Use.

Not all riparian owners are alike. Some are using the water for beneficial purposes; against these there is no complaint. Others are preparing to use it in the near future and there is no disposition to interfere with their plans. Some of the power companies are using the water and others are preparing to do so. The complaint is against those who hold the water out of use, and hold up the development of the country until such time as the necessities of the people have been so great that they will pay the highest prices for the use of water the land with the water will bear.

The Oregon Code.

Oregon enacted a code similar to that we desire. It was attacked by the power companies and riparian interests and carried to the supreme court of the United States. Justice Brewer rendered the decision for that body as follows:

"A state may change its common law rule to permit the appropriation of flowing waters as it may deem fit." 174 U. S. 702-702.

The same judge said in 206 U. S. 94: "The state may determine for itself whether the common rule in respect to riparian rights or that doctrine which obtains in the arid region of the west, of the appropriation of waters for purposes of irrigation, shall control."

There is only one exception to this, and that is in case of navigable streams where the sovereign power is vested in the United States government instead of the state.

Wealth of Irrigated Lands.

President Benson in his address at the irrigation institute that met at North Yakima November 14 and 15, said: "The capitalized property in the state of Washington created by irrigation approximates $500,000,000." It is conceded that this is only a small per cent of the land of this state that could under a proper system and proper legislation be irrigated. Washington could be made productive and wealthy beyond dreams of fancy. It will be so; but the question is whether the toilers, the real farmers and homemakers shall pay most of that wealth into the hands of persons who have done little or nothing to create it, and have simply gotten possession of the natural sources of wealth to enrich themselves at the expense of the masses; or whether it shall go to those who perform the labor and make the sacrifices to build a country.

What Shall We Do About It?

It seems to me that every one who is interested in the progressive development of this country; who desires to see its resources utilized as rapidly as the natural currents of immigration westward will appropriate them; who would like to see the state of Washington rank with our sister states in making easy terms for settlers and homebuilders, should interview his representative in the next legislature, and see if he can not exercise an influence that will overcome the influence of those opposed and obtain the needed legislation.

Factory Planned for North Yakima

The above is a picture of the sugar beet factory at West Jordan, Utah, 15 miles west of Salt Lake.

The North Yakima plant is to be a reproduction of this one. The capacity will be 600 tons of beets per day and will cost $1,000,000. In addition there will be erected a pulp drier to cost an additional $50,000.

Public Meetings

Learning How to Conduct Them

To the Editor of the Washington Farmer: It has often occurred to me that many of our farm boys, good, bright fellows, that can direct the work on a large farm have a very limited knowledge or none at all in the proper conducting or managing of a public gathering. We are making an effort in our vicinity to partially overcome this by keeping up a regular old time literary society. It is a source of genuine pleasure and also of great benefit to a community. There may be a gathering of 20 of the representative farmers meet and out of that 20 there may be two or three that can preside at the meeting with a semblance of parliamentary knowledge, the balance would make a mess of it. Such should not be the case. It is true we can't all be leaders, but more of us can get a smattering at least of rules of order. Our legislature has a lamentable scarcity of farmers, but whose fault is it? The very backbone of our nation comes from the agricultural districts, our brightest, strongest statesmen are invariably farm boys, who at one time took part in some country literary. We could urge more farm boys and girls, too, to get busy and form a literary in your district and see how much you may improve during the winter. Try it and you will never be sorry. A. O. LEE.

Othello, Wash.

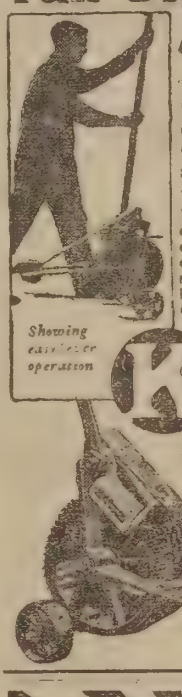
Grange Extension School.

Baw Faw grange's first farm extension school in Chehalis county, Washington, has been reported to have been a big success. The attendance reached 250. It was held during a farm school at Chehalis, the instructors being carried between Chehalis and the grange hall every day in automobiles of President D. W. Noble and Cashier Arthur S. Cory of the Chehalis National bank. Glen O. Roundtree, master of the Baw Faw grange, J. A. Keener, W. G. Foster and J. A. Roundtree are entitled to much credit for the school's success, they having handled the arrangements.

Big Farm Brings $84,150.

What is said to have been the largest real estate deal made in Garfield county this season was closed when the J. M. Williams ranch of 935 acres on Pataha flat, Pomeroy, was sold to John Keatts for $84,150, or $90 an acre.

Edison Electric Light In Your Home



Mr. Edison's Free Book tells you how you can get all the electric light you need from the wasted power of your own gas engine.

Thomas A Edison Electric Light Plant

After years of labor, Mr. Edison has perfected an absolutely satisfactory home electric lighting system. His storage batteries can be charged by your engine while it is pumping water, grinding feed, etc. The Edison Plant is always dependable and simple to operate. Get his Free Book and learn about this great system. Just send your name and address on a post card today. Address:

Spirit of Cooperation Grips Dairymen

McInnes of Dungeness Tells Washington Association How Milk Producers Fought and Won

By PAUL E. TRIEM

Among the outstanding features of the annual meeting of the Washington State Dairymen's association, held at Auburn, December 28 and 29, were the following:

The amalgamation of the young and virile Northwestern Dairymen's association with the older Washington State Dairymen's association.

Passage of a resolution favoring trade reprisal against those cities, notably Seattle and Tacoma, where the producer has not been given just consideration. The recently organized boycotts against farm products was the direct incentive to this action.

Passage of a resolution demanding legislation forbidding the use of anything but pure, whole milk in the manufacture of condensed milk, and also providing for the designation on the label of the exact contents of the can, and the plan of manufacture.

Fred J. Mess of Orillia was reelected to the presidency.

Mrs. Ada D. Miller, Seattle, reelected secretary.

W. H. Tierney was appointed state organizer.

D. McInnes of Dungeness was one of the outstanding figures at the annual meeting of the Washington State Dairy association. He spoke several times and on each occasion he gripped his audience as only a strong personality, fired by genuine enthusiasm and faith, can do. In introducing the resolution passed by the Clallam association and referred by them to the state organization (this resolution was in the nature of reprisal against those cities which have used the boycott against producers), Mr. McInnes said:

"If you touch the pocket book of the city business man you will get action—and not till then. Expect no sympathy from city people. You will get nothing from them—absolutely nothing—until you are in a position to demand it. If the dairymen of this state, with their three or four thousand members, can touch the pocket book of the business men in Seattle and Tacoma, they will win!"

Mr. McInnes told the association something of the results attained by organized effort among dairymen in Illinois. At the beginning of this movement the combined pay of the farmer and his family was less than 5 cents an hour. A milk producers' association was formed, a milk strike initiated and within 10 days the city dealers had had enough. Incidentally, the producers had been wise enough to locate all the houses containing babies or invalids, and had insured to all of these an abundant supply of pure milk.

Organization along similar lines followed in New York, and the strike there was successful within one week. Following up these first victories in Illinois and New York the producers are at this time beginning to build their own creameries, condensaries and cheese factories.

"If farmers can't raise money on their assets for these purposes, I should like to know who under the heaven can do it," Mr. McInnes commented. "A great many people say that the farmer can't do his own business, but I want to tell you, gentlemen, that he can do it, and that all he has got to do is to get a hustle on."

Importance of Dairying.

Between 100 and 150 delegates and visiting dairymen attended the first day's session of the annual meeting, held in the high school building at Auburn. W. H. Paulhamus, who delivered one of the significant addresses, commented upon this by saying that there should be just 10 times as many in attendance, when the importance of dairying to the northwest is considered.

"The trouble with dairymen has been their indifference to their own interests," Mr. Paulhamus declared.

He went on to point out the general tendency of the policy followed by the condensors to eliminate competition, putting the milk producer completely in their hands. In the matter of financial reform, the speaker pointed out the possibility of saving by buying hay in large quantities at the season when it could be obtained most reasonably, and then storing it in warehouses till needed. In reply to a question concerning the method of financing this rather imposing undertaking, Mr. Paulhamus remined his hearers that upon their warehouse receipts for the hay their bankers would be glad to advance them money. In this way the hay would again become "liquid capital" until needed.

Feeding Dairy cattle.

Professor A. B. Nystrom of Washington State college went into the practical science of feeding dairy cattle.

"Years ago, before much study was given to the composition and digestibility of our feeds," Professor Nystrom explained, "It was thought that no matter what kind of hay or grain the cow consumed she would be able to manufacture milk economically from it. Today, however, we know that different combinations of feeds give different results."

This fact and the need of study implied accounted, in part at least, the speaker thought, for the failure to make a profit on dairying complained of over so wide an area. "The fact that a cow eats freely of the feeds she has been given is no proof that it is what she needs. Perhaps she is craving one element, only small quantities of which are found in the foodstuffs before her."

Professor Nystrom spoke highly of the value of ensilage, and pointed out the relative advantage of sugar beets, with their percentage of digestible carbohydrates, over other roots, all of which he ranked high in feeding value. He concluded by advising his hearers not to attempt highly technical problems in feeding, but to study the principles of food values and apply these principles and common sense in feeding their cows.

Dr. H. T. Graves.

D. Griffiths of Auburn presented the reports of the resolutions committee Friday morning. These resolutions, all of which were adopted, expressed the sympathy of the association with the family of the late D. S. Troy in their bereavement.

A request by the state Butter Makers' association that the meetings of the two associations be held at the same time and in the same place hereafter, to facilitate cooperative action in the various matters affecting both industries, was acted favorably upon.

State College Indorsed.

The work of the Washington State college was indorsed and protest was expressed against any attempt to limit the present scope of this work.

The value of the work at the western Washington experiment station at Puyallup was also recognized. The association recommends to the legislature that a dairying building be erected on the state college campus for the furtherance of education along industrial lines and as an aid to the business in Washington. It urges also that the work of the college be enlarged rather than narrowed.

A slight addition to the present by-laws was made to make possible the merging of the two dairy associations previously referred to.

Bovine Tuberculosis.

Dr. H. T. Graves of the state department of agriculture told the association about the work of his department, particularly as it touched upon the investigation and suppression of bovine tuberculosis. Emphasizing the importance of this problem, at any rate as viewed by his department, Dr. Graves pointed out that "If the average usefulness of one cow extends through only three lactation periods, because of the ravages within her system of tuberculosis, the burden of her lost productivity falls upon every cow and every cow owner in the business."

"The milk consuming public demands, and will continue to demand, milk free from the taint of this disease," declared the speaker. "And in this connection our department recognizes the unmistakable fact that pure milk can not be sold at the price at which dirty or unsanitary milk is sold, and that the commonwealth must come to the assistance of the producer."

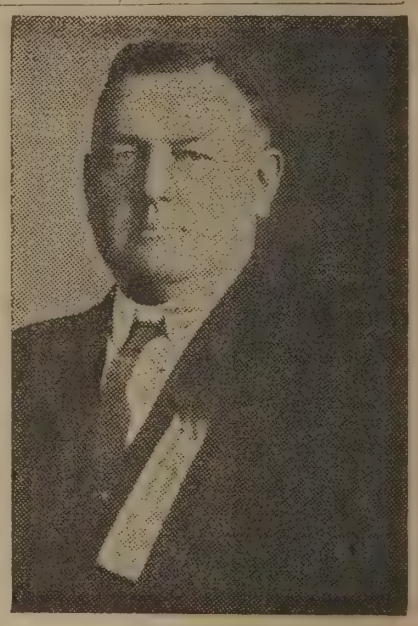
After describing the early history of the present methods of detecting tuberculosis, due largely to the investigations of Dr. Koch, Dr. Graves described the typical symptoms of the disease in dairy animals. Among the more striking of these are general unthriftiness, large glands, lumps in the udder and cough. He added that all of these symptoms were sometimes associated with other ailments, and that the only reliable test was that in which tuberculin was employed. This means of diagnosis, the speaker said, had been found 98 per cent accurate by the federal government. This statement came up for farther consideration later in the day.

Dr. Graves concluded by recommendign various sanitary measures in connection with the housing and care of cows; among these were the use of concrete for floors, walls free from unnecessary projection, and smoothly finished; ample air space and ventilation; clean food and feeding methods; plenty of sunlight and good drainage.

McInnes Fires a Shot.

Mr. McInnes' principal address was one in rebuttal of that delivered by Dr. Graves. His opening volley was a telling one.

"If you gentlemen seated in this room were not farmers," said Mr. McInnes, "it would be safe to predict that if the tuberculin test were given you, 80 per cent of you would be reactors. As it is, in spite of your open air lives, probably 40 per cent of you would react. And you don't need to worry about yourselves either—as long as you eat your three meals with enjoyment and sleep fairly well, you needn't think about these things."



The speaker declared that 80 per cent of the royal guard in the Austrian army had been reactors. "Yet these men were picked for their fine physiques. And they were not sick—any more than a reacting cow is sick."

The findings of the Illinois legislative committee were quoted freely by the dairyman from Dungeness. "That committee made the most thorough investigation ever made in this country, or in any other country," he affirmed, "and they rendered a report that the tuberculin test was not only not needed, but that if continued it would wipe out the dairy herds and industry of Illinois."

While it is only fair to Dr. Graves to explain that he was not present when this address was delivered, it is doubtful if any speaker in the country could have done much to modify the enthusiasm of those who applauded Mr. McInnes. Even after proper allowance is made for the effect of the personality of a masterful speaker, it would seem that the producing dairymen of the state of Washington are not really convinced of the value of the tuberculin test.

Organizing Dairymen.

W. H. Tierney, whose strong resemblance in the general cast of his features to President Wilson was commented upon by many of the audience, told the association something about the work of organizing the Northwest Dairymen's association. The real seed of this organization was sowed by the condensaries themselves, when they offered the farmers in Skagit county a premium on Holstein milk. Afterwards this premium was discontinued, and the milk producers decided to organize. Seven hundred men paid in their annual dues and signed an agreement, backed by a forfeit of $10 per cow, to sell only through the organization. Forty thousand dollars was subscribed for a condensary—and the condensary which had been buying, re-

Fred J. Mess.

established the premium. More than that they raised the price of milk from time to time. And as the condensary kept raising the price of milk the milk producers kept on organizing, till Skagit, Snohomish and Whatcom counties were solidly knit together.

Two points of great significance in relation to this work of organizaing were brought out by Mr. Tierney: First, it is useless to try to get dairymen to attend meetings. They won't even come to picnics. The second fact is that when milk prices are tending upward, the enthusiasm of association members for the machine which has brought them financial recognittion tends to grow cooler. But in spite of these disintegrative forces Mr. Tierney predicted that no great difficulty would be encountered in organizing the 15 counties of Washington and Oregon which are really fitted for dairying.

Richards Buys Farm.

What is known as the Rogers farm on Butler creek has been purchased by Thomas Richards and sons of Stanfield, Ore. There are 480 acres of land in this farm and the consideration paid was $32,000.

Of the 480 acres there are 230 acres of alfalfa land and the rest is bottom land that can be irrigated when there is a surplus of water and which will grow good barley without irrigation.

Farmers' School

Well Known Educators Interested

Professor W. H. Olin, whose enthusiasm in the cause of better farming made him a well-known figure in the Pacific northwest a few years ago, is now connected, as professor of irrigation, with the American Farmers' school at Minneapolis, devoted to teaching farming by mail.

Professor Olin has had varied experience; born and brought up on farms in California, northern Ohio and eastern Kansas, he became a public school teacher, and later professor in various agricultural colleges and was director of agricultural extension work at the University of Idaho in 1911.

The interest in farm education is shown by the large number of well-known educators who are included in the faculty of this farm correspondence school. Such men as Professor H. H. Kildee of Iowa, Professor Thomas B. Cooper of North Dakota, Dr. John A. Widstoe of Utah, Professor A. N. Ten Eyck of Kansas and many others are identified with the school.

YAKIMA CROPS

Big Increase Over Last Year.

The total crop production for the Yakima valley for the last year is $5,000,000 greater than the total for 1915, according to figures compiled from the most authentic sources. In round numbers the total for the last year is $14,600,000. The greatest increase came in the returns from apples and potatoes, but increased prices all along the line have brought more money from almost every source. The greatest gain is in potatoes. Here both the yield and the price are greater than last year, the price being practically double that of last season. The crop this year was 37,500 tons and the average price $25 a ton, bringing the total on this product alone to nearly $1,000,000.

SUNNYSIDE PROJECT

Water for 5000 Acres More Land.

The total cost of operation and maintenance on the Sunnyside project in the Yakima valley is $73,465 for the fiscal year ending December 31, according to figures compiled for a report by Project Manager R. K. Tiffany. This is $214 less than the total for 1915 and the canals have carried water for 5000 acres more, the increase representing the amount of land under the Outlook pumping plant. The Sunnyside canal carried water this year for distribution to 73,000 acres and the cost for operation and maintenance is practically $1 per acre for the land served.

TICHACEK RANCH

Moses Lake's Pioneer Homestead.

The purchase of the well-known Tichacek ranch near Neppel, Grant county, by Henry M. White, United States commissioner of immigration at the port of Seattle, and John H. Sargent, first assistant of the immigration department in that city, recalls the fact that this is the pioneer homestead of Moses lake. Mr. Tichacek purchased the place in 1906 of Mr. Lewis, the original homestead entryman. The ranch is highly improved under irrigation. There are 30 acres of old orchard, 20 acres of 3-year-old orchard and 25 acres in alfalfa.

NORMAL SCHOOL

Ellensburg Institution, $280,000.

President G. H. Black and the trustees of the state normal school at Ellensburg want $280,000 from the legislature for new land, buildings and repairs. The aim of President Black and the trustees is to have all the buildings and equipment standardized and put on the same basis for all three normal schools. They only normal in this state which has a modern plant is the school at Cheney.

FARM LOAN BOARD

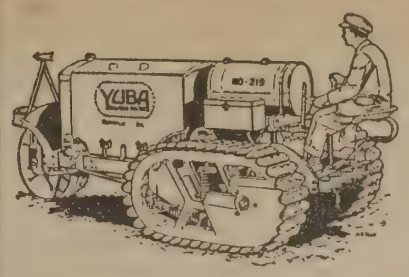
Will Name Salaried Officials.

The national farm loan board has informed Representative Dill that soon four salaried officials of the Spokane Farm Land bank will be named, a president at $6000, a registrar at $4000 and secretary-treasurer at $3500 each. It is planned to select one of these officials each from Oregon, Washington, Idaho and Montana, the states embraced in the northwest district.

Man Kills 906 Rabbits.

The jack rabbit bounty law recently enacted by the initiative in Crook county, Oregon, is getting results with a vengeance as was indicated one day last week when Oscar Cruse, a homesteader of near Brothers, this vicinity, came to Prineville with the scalps of 906 jack rabbits, which he had killed within the past week. He received $45.30 bounty from County Clerk Warren Brown.

Wheat and Vetch.



R. L. Schroeder of Burlington is one of the successful farmers of Skagit county, who has changed the common combination of oats and vetch to wheat and vetch. He says that he finds the latter combination much more satisfactory because the wheat matures at the same time as the vetch. He urges early spring sowing.

Potato Digging Crew

To the Editor of The Washington Farmer: This is a picture of my spud crew of last fall. They are Yakima Indians. I couldn't get them to face the camera, so I took a cigar box partly filled with silver to pay them, as I am through digging. I told them to see if there was enough "muck-er-muck," or money, to pay them off. Even at that one threw herself backward on the pit and the other quickly turned. I am sitting on one knee, with the cigar box in my right hand and my left on my left knee, facing the Indians.

Outlook, Wash. W. F. NASS.

Price Advance

January 15

1917

THE rising cost of material used in the construction of the Yuba Ball Tread Tractors has reached such a point that we are no longer able to maintain the prices heretofore charged.

It has been our hope that the increased output, the utilizing of improved mechanical devices in the manufacturing, the introduction of greater efficiency, the standardizing of factory practice, would enable us to continue supplying the tractors at the present prices.

But recent sharp increases in the price of steel necessitate an advance of 5% to 6% on each model.

All orders received before January 15, 1917, will be accepted at the present prices

The Yuba Construction Company
433 California Street, San Francisco
Factory at Marysville, California
Models 12-20 and 20-35

The Yuba Construction Company
433 California Street
Department C304
San Francisco, California

Gentlemen:—I have been thinking of buying a Tractor some time—possibly next year—but may decide to buy before the advance.

Please send me your Catalogue. I have_____acres. Yours truly,

160 ACRE FARMS IN WESTERN CANADA FREE

Canadian Farmers Profit From Wheat

The war's devastation of European crops has caused an unusual demand for grain from the American Continent. The people of the world must be fed and wheat near $2 a bushel offers great profits to the farmer. Canada's invitation is therefore especially attractive. She wants settlers to make money and happy, prosperous homes for themselves by helping her raise immense wheat crops.

You can get a Homestead of 160 acres FREE and other lands at remarkably low prices. During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to acre. Wonderful crops also of **Oats, Barley and Flax.**

Mixed farming as profitable an industry as grain raising. The excellent grasses full of nutrition are the only food required for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent.

Military service is not compulsory in Canada, but there is an extra demand for farm labor to replace the many young men who have volunteered for the war. The Government is urging farmers to put extra acreage into grain. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Canada, or

Douglas County Council

Composed of Thirty-Three Leading Farmers

The Douglas County Agricultural council has been organized to promote the agricultural welfare of the county. It is composed of 33 of the leading farmers in the county. It includes one representative from every community in the county, one county commissioner and three farmers appointed by the board of county commissioners and the county school superintendent. Each community chooses its own representative in the council and the county commissioner member is chosen by the board of county commissioners. The following representatives from the different communities in the county were chosen at meetings held the latter part of November and the first part of December:

Community	Name.	Address.
Rex	M. H. Brown	Delrio
Delrio	Albert Wyborney	Delrio
Delrio	E. Wagoner	Delrio
Leahy	Milan Snell	Leahy
Pearl Hollister	A. E. McLean	Pearl
Willow Spring	Pete Hanson	Withro
Mud Springs	Joe Dittert	Mansfield
Gordon	W. E. Mintzer	Gordon
Mansfield	Mike Leahy	Mansfield
Dyer	Stanley Priest	Mansfield
Mansfield	F. P. Martin	Mansfield
Mansfield	Garfield Cox	Mansfield
Nelson Farmer	T. E. Cope	Mansfield
Jamison	W. W. Proctor	Withrow
Jamison	William Engle	St. Andrews
St. Andrews	Carl Larson	Baird
Highland	Royal Carpenter	Bright
Mt. View	Joe Brown	Mold
Mold	O. I. Frederick	Withrow
Lamoine	Charles Olmstead	Waterville
Poplar Grove	John Gormley	Waterville
Sheehan Flat	Alex. Brett	Wenatchee
Beaver Creek	Henry Goll	
Orondo	C. R. Bond	Orondo
Rock Island	E. Gaut	Wenatchee
Wide West	C. J. Olson	Wenatchee
Waterville	John McKay	Waterville
Bridgeport	R. E. Darling	Bridgeport
Co. Supt.	L. L. Sellers	Waterville
Co. Com.	Joe Sanders	Mansfield

Three farmers appointed by the county commisioners:

T. S. Hedges	Alstown
D. W. Tomlinson	Mansfield
C. N. Campbell	Pearl

The duties of these representatives will be to cooperate with the Washington State college, the United States department of agriculture and the county agricultural agent in outlining the work for this office. Each representative will advise with this office in regard to the work to be done in his community by this office. All of the representatives will meet one or more times each year to help plan the work of the office for the whole county.

The first meeting of the agricultural council was held at Mansfield, December 8; was called to order by the county agricultural agent and Royal Carpenter acted as temporary chairman.

F. P. Martin, Mansfield, was elected president; O. I. Frederick, Mold, vice president; and Garfield Cox, Mansfield, secretary.

President Martin took the chair and called upon each representative present to tell what he considered the most important problems in his community and what lines of work he thought the county agricultural agent should do to help solve these problems.

Charles Olmstead, Lamoine, said that he was afraid no one system of farming could be generally adopted for the whole county on account of soil and climatic conditions varying so much. It was explained that the marked variations in soil, rainfall, machinery best adapted, etc., was one of the main reasons for having a representative from each community.

Royal Carpenter, Highland, said that smut and the maintaining the fertility of the land were two of their most serious problems. He said that the burning of the stubble was altogether too common, and should be discouraged whenever there was an opportunity at meetings or elsewhere.

Milan Snell, Leahy, said the things that he would like to see improved were the roads, methods of cultivation and the weed problem solved.

O. I. Frederick, Mold, said they needed a better variety of winter wheat, better roads and the weed problem solved.

Joe Brown, Mt. View, spoke very highly of the work done in his community, Washington State college specialists in home economics, poultry and live stock and wanted to see more of the same kind of meetings held. He emphasized the importance of live stock in the county and said he would like to hear some of the specialists from the Washington Statte college discuss the common diseases of farm animals and tell how to control them. He said the land hogs and the weeds were two of their worst problems.

John McKay, Waterville, said he thought demonstrations were one of the most important lines of work to be done, that is, having some good farmer practice the best known methods and let his work serve as an example for the community. How to prepare the best seed bed in the spring, control of wire worms, kinds of tillage implements and machinery, farm help, marketing, roads and the use of only the best varieties of wheat and pure seed were among the problems mentioned by him.

Garfield Cox, Mansfield, said he would like to see something done to improve the farm homes so people would have a feeling of permanency and not want to be moving away. He said this was as good a place to live as they would find and many of them would live and die here and should feel that it was home.

Pete Hanson, Willow Springs, said they would be glad to have meetings on any subject because it would all be new and helpful to them.

William Engle, Jamison, said it was difficult for them to get people out to meetings, but would do all he could to work up interest in any meetings arranged for there.

Fred Fachnie, Lamoine, said he believed one of the best things to encourage was the raising of sheep on the farms and stated that he had 50 head of old ones and 37 lambs. The old ones averaged over $2 worth of wool apiece this spring, were no trouble to take care of and that they were the best weeders on the market. He also said the roads should be improved.

D. W. Tomlinson, Mansfield, said that the growing of mixed varieties of grain was causing the farmers as much loss as smut. He said that encouraging the growing of pure wheat and fighting smut were two of the most important problems to be worked on in the Mansfield country.

C. J. Olson, East Wenatchee, said they needed instruction on the storage of fruits and on the care of live stock, especially in handling diseases. He said something should be done to maintain the fertility of the soil.

Mike Leahy, Mansfield, said he believed that one of the most important things that could be done was to encourage interest in the federal farm loan bill.

Irving Vestal, Palisades, said they would like to have any help they could get in the fruit business and mentioned pruning demonstrations, instructions regarding the control of insects and diseases, and instructions on making vinegar, raising poultry and road work.

Stanley Priest, Mansfield, said too many of the farmers were moving to town, and that the main way to interest them was to increase the yield of wheat. He said the women were more interested in improving conditions than the men.

County Superintendent Sellers said he was interested more from an educational standpoint and to that end would like to see more farm meetings conducted so the school children could attend them. He said on account of so many teachers coming from outside the county and not being familiar with agricultural conditions in the county it was necessary for the county agriculturist to help with the agriculture in the schools by visiting the schools and giving talks to the pupils on the agriculture of the county, especially when the talks could be illustrated with pictures taken to illustrate different methods of farming in the county. He said club work and the community fairs were important factors in the education of the boys and girls, and that cooperation of the two offices was necessary to carry on the work.

The following lines of work were discussed and adopted by vote of the council: A booklet on the agriculture of the county to be writtten by the county agricultural agent for use in the schools and for general distribution; a farmers' exchange; an auto excursion to the Washington State college next spring and another auto excursion in the county; to encourage interest in the wheat convention and the farmers' short course at the Washington State college; to encourage pure seed wheat and fight smut; and to give more publicity to the work.

The meeting adjourned until called again by the president.

Pomona Grange

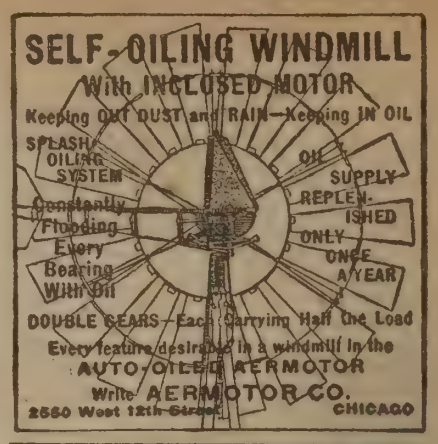
County Agent and Farm Loans

By MRS. R. R. WILLIAMS, Shelton, Wash.

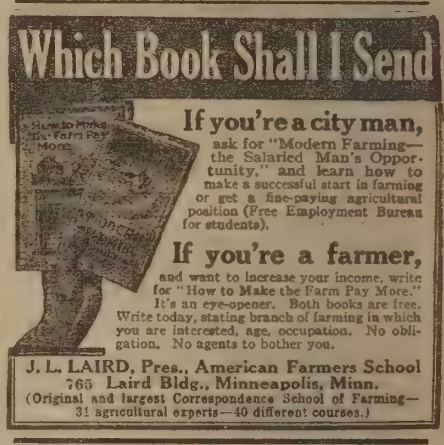
At the annual meeting of Mason County Pomona No. 20, on December 19, a public discussion was held on the advisability of securing a county agent for Mason county and also on the forming of a national farm loan association in Mason county.

Three of the five subordinate granges in the county had reported favorably to Pomona on the county agriculturist question, and a committee is to be appointed from the five subordinate granges, with one member from Pomona grange, to meet with the county commissioners at their meeting early in February and urge them to take action at once to provide funds for the next year to meet the expense from the county for a county agriculturist.

The forming of a loan association was left to a temporary committee of three, who are to receive applications until enough have been recorded to form an association and elect officers. The committee is composed of Messrs. King, Hayes and Huston, all of Shelton. Subscriptions amounting to $12,500 were taken at once, although many present at the discussion were obliged to leave before any action had been taken. The committee is confident that there will be no difficulty in making up the required amount to form an association within a short time.



Community Advertising on a Big Scale

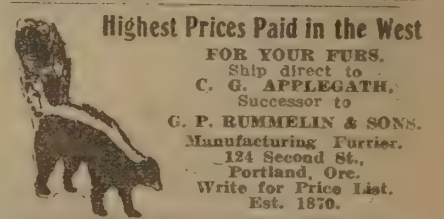


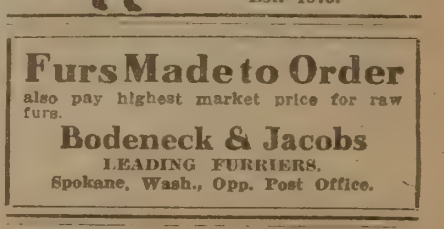
Lawrence H. Brown, secretary of the Washington State Good Roads association, told the delegates to the recent convention in Centralia, Wash., something about the trip which he and some other northwest boosters took in an automobile this summer, crossing the country from Chicago to Tacoma and preaching the doctrine of the big northwest as the nation's summer playground as they journeyed. Mr. Brown told his hearers that the citizens of the northwest must get away from sectionalism, in their boosting, and must realize that this corner of the country is a geographical unit, so closely united by natural and inevitable ties that no section can wax fat at the expense of its fellows.

"We must get away from our little neighborhood squabbling, and realize that while California may be a good place to spend the winter, the northwest has absolutely no competition when it comes to a national playground for the summer months."

Mr. Brown concluded by telling his audience that some of the worst roads encountered on the entire trip were met with between Spokane and Seattle, on the last lap of the journey.

"We have no right," he declared, "to get visitors out here by our advertising, and then force them to travel over such roads as these. Sooner or later we must have a cross state highway usable 12 months in the year, and from what we have heard at this convention I believe the North Bank highway is the most logical location for such a year-'round road."





In answering advertisements don't fail to mention this paper.

Yakima Woman Makes Good

The Best Friend of the Stockmen Is Her Title

By SOESTER I. ANTHON

"The best friend of the stockmen in the Yakima valley" is the pet title all the stockmen of central Washington have for Mrs. Legh Freeman, who for the past two years has been editor in fact of Freeman's Farmer, as she was editor in all but name for the previous seven years. And when the stockmen speak in such glowing terms of the quiet, sad-faced woman who holds so high a place in their esteem, they do it with the confidence which comes from many trials and tests. Mrs. Freeman has never failed them.

For a woman to edit a farm journal is unusual enough, but when she adds to this the capacity to run a printing office, in which she can do everything from figuring on jobs to setting a stick or two herself, it becomes even more unusual. With all this Mrs. Freeman has a knowledge of farm problems, and particularly of the problems with which the stockmen deal, so that she is recognized as an authority by them.

Mrs. Freeman, who looks as though she should be peacefully reading in front of a fireplace instead of wrestling with the difficulties of the business world, is the first person consulted when the stockmen wish to have an event out of the ordinary. She is the first person invited to their meetings and no person's opinions are heard with more respect. To be sure, she is also the first person invited to head their subscription lists and she never fails them.

When Mr. Freeman, after running a farm paper for 50 years, died two years ago and left his widow with a young daughter in her teens and a printing plant on her hands, most persons shook their heads sadly. It never entered their heads that Mrs. Freeman would attempt to run the plant herself. When she first suggested it to her friends they either held up their hands in horror or begged her not to make a fool of herself. What woman could secure material and write of such earthy problems as the proper rations for cattle in winter, the benefits of silage, the problems of subirrigation, methods of avoiding alkali and all the technical difficulties of farmers in an irrigated district? As for running the printing presses and directing men—union men, at that—it simply couldn't be done.

During all the discussion Mrs. Freeman said little but, as is characteristic, she thought much and to good effect. There came a day when her mind was made up. With a firmness which left no doubt, she announced that she would operate the plant and edit the paper. She had ambitions to enlarge the farm journal and increase the printing plant to make matters worse. The ambitions have been partly fulfilled and are in a fair way to be entirely fulfilled.

Mrs. Freeman and her daughter, Miss Varina, took entire charge of the farm journal. The daughter, still a mere slip of a girl, solicits advertising, helps with the business end of the office and can do everything about it, even managing the intricate mechanism of the presses. Mrs. Freeman herself edits the paper, plans its contents month by month and improves each issue to a remarkable extent.

In the two years which have elapsed Mrs. Freeman has done more than make a business success. She has gained a place in the life of North Yakima which is held by no other woman. At the recent school board election period she was urged to become a candidate for the school board. During the campaign to contract acreage to enable the valley to secure a beet sugar factory, Mrs. Freeman's support was the first solicited and the most cheerfully given. Before the community more than realized that the beet sugar factory was a possibility and before the farmers had any idea of what it might mean, Mrs. Freeman printed a "sugar beet" issue of her journal. Amply illustrated and filled with facts about the growing of sugar beets and the returns to be expected, it helped induce many farmers to sign up for his share of the needed acreage. During the recent convention of the walnut growers of the Pacific northwest Mrs. Freeman did her share in pointing out the future of the industry in North Yakima and reprinted many of the papers read at the convention for the benefit of the valley farmers, who already have 300 acres in walnut groves.

When Mrs. Freeman enters a convention hall or a stockman's meeting she is a demure little woman who is given to seeking the first seat and listening intently to what is going on. But when she is called upon to give her opinions she gives them with the quiet assurance which goes with a clear knowledge of the matter at hand. It is when she discusses her pet journal that she is most thoroughly roused.

"Mrs. Freeman has certainly stood by the stockmen and we stand by her," explains E. B. Marks, the owner of the famous Marks herd of Holsteins. "Whenever the stock business needs a boost of any kind we ask her. We always get what we need. She knows the stock business and her work for the stock industry of the valley has been worth more than most persons realize."

"She is a worker for whatever seems to her to be for the advantage of the farmer. She has helped the boys' and girls' club work. She has done her share and more for the state fair and the Cascade International. She does her share by everything. The stockmen of this valley, as well as the general farmers, owe her a debt they can never pay."

Italian Prunes

Culture in Western Washington

By J. F. CASS, Mount Vernon, Wash.

Some 20 years or more ago considerable orchard planting activity was manifested in western Washington. Also in the Willamette valley of Oregon. It was found that many varieties of the apple could be profitably grown on this northwest Coast. Among the other tree fruits planted largely at that time in the Puget sound region was the Italian prune. The writer remembers particularly one large orchard of some 50 acres in the vicinity of East Sound, on Orcas island, owned by a syndicate of Seattle capitalists. Also another of about the same area just north of the international boundary in British Columbia, near Blaine, owned by the Mogridge Bros., a couple of young aristocratic Englishmen. And just south of that at Custer, Whatcom county, a fine orchard of the Italian prune, C. H. Stoltenberg owner, was in full bearing some 15 years ago. Mr. Stoltenberg at about that time erected one of the best patent dryers of that era to care for his crop. Many fine orchards of five to 10 acres of this fruit could be found at the same time in this country also upon the lands of the Skagit valley proper. The trees of most of these, however, were afterwards pulled out, and it is needless to say through the short-sighted policy of the owners. At that time there were no canneries and little market for the fruit, the drying process little understood and as it is yet in the present time. Thus the growers became discouraged.

The planting of prune orchards in eastern Washington and in Idaho is now becoming a rage as was the case of the planting of the apple a few years ago. And the publishing by our agricultural papers of such items as the following may yet lead to great disappointment to many:

"Five acres in the Felida district of Clarke county are reported to have produced a yield of prunes this year valued at over $20,000."

Our own orchard here on the north fork of the Skagit, of a little less than five acres, has during the last 10 years averaged a yield of 50 to 60 tons of the green fruit a year, equal to 12 to 15 tons of the dried product. Still it must be said that most of the conditions obtaining in this orchard are absolutely ideal for the best production. Situated upon the higher alluvial soil of the river bank, with subirrigation from the annual summer raise of the same, and with freedom from frost effects because of the warm current of air from the open sea a few miles west, no failure of crop results. In but few points east of the mountains, it may as well be said, can such yields be counted upon; and in the state of Idaho the present season there has been a total failure of the prune crop from frost.

The soil of our orchard has never been cultivated, except the first two years from planting; and has furnished pasturage for stock during nine months of the year. The Italian prune tree requires little care in the way of pruning, and still less of spraying, it being almost immune of insect attacks. Planting some 30 years ago the orchard seems at the present time to be yet in its prime of growth. Of late years it has been giving a return of about $200 per acre.

Corn

Made Good Silage, Though Frozen

To the Editor of the Washington Farmer: In your issue of December 21 you mentioned that C. J. Nelson of Kent lost his crop of silage corn by frost.

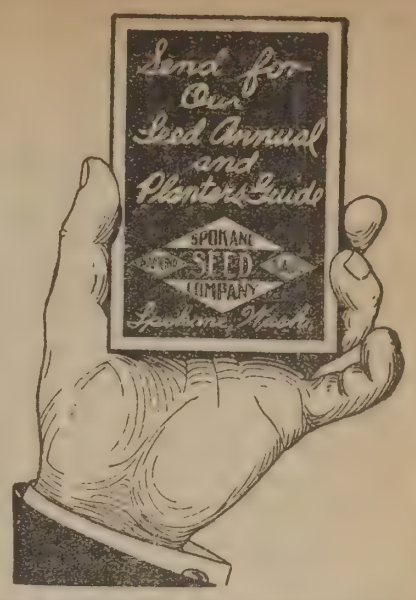
Last May I planted two and three-fourths acres of King Philip flint corn in check rows 30 inches by 26 inches, and dropped six kernels in each hill. Owing to the wet and cold summer, the growth was slow until the dry fall set in, then the corn grew rapidly and reached a height of nine feet and for thickness resembled a southern cornbrake.

Before it reached roasting ear stage three heavy frosts occurred, freezing the tender ears solid each time. It was 14 days after the frost before I could obtain a cutter, and filled the silo, 14 by 32, in two days.

No water was used, but the silage was cut in one-half inch lengths and was firmly tramped.

When finished, the top was covered with finely cut straw to the depth of nine inches, over which was emptied 100 gallons of water.

The yield from the two and three-fourths acres was 80 tons..



When the silo was opened there was only a crust of mold an inch thick and the silage below was bright and clear, without further sign of mold.

The cows chose it in preference to carrots when both were offered at the same time. W. A. PERRY.

Secure Farm Expert.

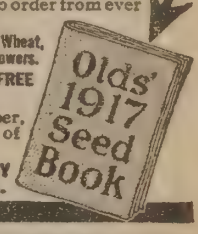
The Washington State Beekeepers' association went on record today at North Yakima favoring the employment of a county agriculturist. They want the commissioners to act at the earliest possible moment and bring the county into line with other parts of the northwest. The farmers' union and the grangers have already taken action favorable to the employment of an agriculturist, and indications are that the new board of commissioners will take early action in securing a farm expert for Yakima county.

On account of the great variation in local climatic conditions, moisture, soil, etc., it is up to the readers of The Washington Farmer always to remember that methods which prove successful in one locality may not work out in others. It is our aim to gather the experiences of farmers in every section of this state and pass these experiences on to our readers, that they may try out or adopt such as may be applicable to their locality and conditions.

I Want to Send You My New 1917 Seed Book FREE

For 30 years I have furnished seeds of highest quality. Thousands of customers attest to this fact. They know my seeds—their growing and yielding qualities. They know of my honest methods. My seeds must make good or I will. 30th annual catalog now ready.

Lists All Kinds Farm, Garden and Flower Seeds



The best arranged, most comprehensive and easiest catalog to order from ever issued. Offers the best.

Potatoes, Oats, Corn, Barley, Wheat, Clover, Alfalfa, Vegetables, Flowers.

Send for it Today. Get FREE Packet Flower Seeds.

If you mention this paper, will include a packet of choice Flower Seeds.

L. L. OLDS SEED COMPANY
Drawer 60, Madison, Wis.

Easy, Now, to Own a Straw Spreader

I WANT to send a Perfection Straw Spreader on trial to every straw owner. I want to demonstrate how easy it is to spread 15 to 20 acres of straw a day; why this is as profitable a machine as any farmer can own.

Sold on Trial

My machine is in its third successful year. Increase your crops $5 or more per acre. In use wherever small grain grows. Pays for itself more quickly than any other machine or implement by returning to the soil the humus necessary to make bumper crops.

Fully guaranteed.

Write for my free book, "Spreading Straw Pays." A postal brings it. C. E. WARNER, Pres.,
Union Foundry & Machine Co.,
726 Union St., Ottawa, Kansas.

Eureka Potato Planter

For Large or Small Growers, 1 or 2 rows

Opens furrow, drops seed any distance or depth required, puts on fertilizer (if wanted), covers up, marks next row. Accurate, automatic and dependable. Operated by one man. Furrow is opened directly under axle and seed is dropped in plain sight of operator. Made of steel and malleable iron, assuring long life and few repairs.

All-the-Year-Round Farm Labor

Sliding Scale of Wages for Periods of Greater and Lesser Demand

By E. A. BRYAN

Nothing is just now more important than the development of a system of all-the-year-round labor on the farm. One of the most serious obstacles to this is the fact that in the busy harvest season, when wages are high and labor is in great demand, the laborer who accepted the average wage gladly and worked contentedly during the slack season of low wages finds himself at work along side a poorer temporary laborer who is drawing much higher wages. He therefore jumps his job or becomes restless and dissatisfied.

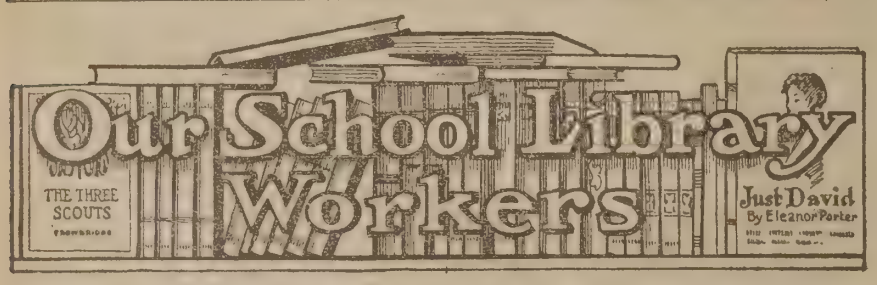
I propose, therefore, a sliding scale for the all-year-around man. Suppose it is agreed that an average wage of $50 per month or $600 per year, the employe to board himself, is a fair wage, satisfactory alike to employer and employe, on a diversifiedf arm in the Inland Empire.

From the middle of June to the middle of October, four months, is the period of greatest demand and highest priced labor. Suppose we figure that four months at an average of $60 per month, or $240.

From the middle of March to the middle of June and again from the middle of October to the middle of November, four months, is medium in labor demand and wages. Let us figure that at $40 per month or $160. This makes a total of $600 for the year.

In addition to this use of a cottage and small garden and some fruit from the farm orchard and possibly a pig or two to be kept in a pen to consume the slops would add materially to the income of the employe's family and encourages thrift and personal interest in and loyalty to the business. It is far better than temporary and uncertain hire at much higher wages.

If the proposition is based on a lower rate as might well happen, with an agreement at an average wage of $40 per month or $480 per year, the problem would work itself out for the same months as follows: Four months at the $48, or $192; four months at $40, or $160; four months at $32, or $128; total, $480. If the value of cottage and garden were $12 per month this would make the real wage $60, $52 and $44 or $624 per year.



Perhaps, under our system it would be fair and advantageous to both parties if the payment of a portion of the spring and summer wages should be deferred until fall when the crops are realized. A bonus of from $20 to $40 at the end of the season is good policy.

I am satisfied that we can not move very fast or very far toward diversified farming until we have the all-year-around employment. I believe we can not have this without providing a cottage and a small garden for the employe.

The plan I have suggested makes for the stability of farming, for good relations between the farmer and his employe, wholesome opportunities for the tenant's family, better care of machinery, tools, live stock and soil, an increase in the population of the community and so better rural schools and in the end a larger number of land owners and smaller farms.

In connection with this article by Dr. Bryan, it is interesting to know that an investigation carried on in 1899, by the bureau of statistics of the United States department of agriculture, shows that less than 30 per cent of the day laborers on farms, working at monthly rates, kept at work during the entire year, the other 70 per cent, on the average, worked much less than one year.

In 1909 the average wage rate of outdoor labor of men on farms, per month, by the year, without board, was $18.05; ranging from $13.10 in south Atlantic states to $31.30 in the western states. In 1866 the average rate of wages was $10.09; in 1880 or 1881, $12.32; in 1889 or 1890, $13.29.

Here she is—the champion library worker of the northwest. Miss Mildred tell us in an excellent little letter just how she takes subscriptions. Of course she doesn't say one word about the bright and winning smile that you can see, with only half an eye, is a mighty big part of her equipment. And just among ourselves we haven't the least little bit of doubt that Miss Mildred knows just how to use those big, half-mischievous brown eyes very effectively, indeed.

Just listen to what she says about how she takes subscriptions: "It is very easy to take subscriptions for your paper, especially among farmers and stockmen. All I had to do was to tell them our school (Bossburg school) was trying to earn a library and none refused to subscribe, some taking three-year subscriptions. We have our library and for my own I choose 'Just David.'"

Isn't it easy and simple? Yes, it certainly sounds so the way Mildred modestly put it. But we still cling to the belief that much of her success was due to her winsomeness and cheery smile. Miss Mildred, we offer you our very best wishes for a Happy, Happy New Year, and we thank you heartily for the splendid example you have set for other school library workers in this state and in other states as well.

Miss Mildred Glasgow.

NEW SCHOOLS ENTER.

New schools to enter actively into the work of securing a library are:

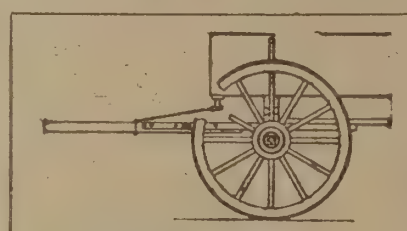
Harrah School	F. G. Bennett, teacher
Parker Bottom School	Clara M. Johnson, teacher
Excelsior School	O. Agnes Wiley, teacher
Sunnyside School	J. G. King, teacher
Deno School	Margaret Spicer, teacher
Malloy Prairie School	Beryl McCabe, teacher
Bonser School	Margaret F. White, teacher
Grandview School	Mabel S. Preston, teacher
Granite Lake School	Sada Fox, teacher
Groebli School	Margaret A. Nash, teacher
Four Corners School	Cordelia Griffith, teacher
Outlook School	A. W. Curtis, teacher
Beaver Creek School	Marvel D. Miller, teacher
Central School	H. C. Vesper, teacher
Cowiche School	S. S. Busch, teacher
Springdale School	John Dempsey, teacher

HONOR ROLL.

Greenwood School—Harold Cline, Margaret Silver and Hazel Cline.

Wiley City School—Isabella Besancon, Julia Boone, Madge Carpenter, George Langworthy, Alice Wingard, Mildred Parker, Lila C. Draper, Constance Wiley, Malcolm Wiley, Elsie Young and Marion Hughes.

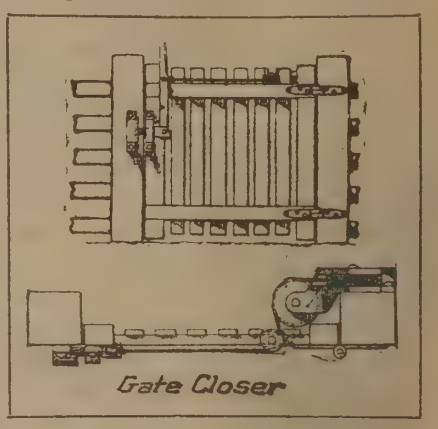
Hunter Creek School—Harriet Johnston, Lillian Cornwell, Marjorie McCanna, Franklin Cornwell and Mark Mills.



Logan School—Ida Michaels and David Michaels.

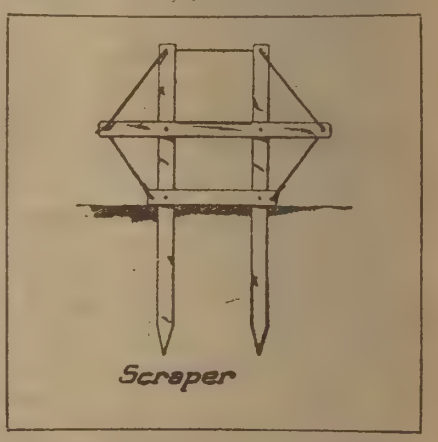
Inventions

By C. J. LYNDE, Macdonald College, Quebec.



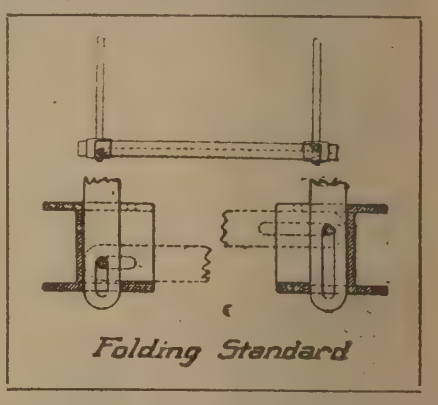
Tongue Support.

It is claimed for this support that it takes the weight of the tongue from the horses and yet does not interfere with the turning of the wagon. It is a chain and stout spring attached to the tongue and to a pulley which travels on a strongly braced rod.



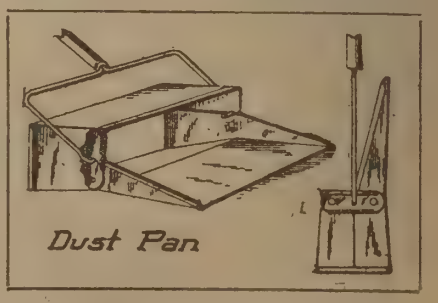
Gate Latching Device.

The rope of this device is attached to a weight at one end and to the latch handle at the other. The weight closes the gate and forces the latch out so that it engages the keeper.



Scraper.

The scraper shown here is made of wood or of metal; the bars are used to clean the soles of the shoes and the wires to clean the uppers. It is driven into the ground at any convenient place near the door.



Folding Standard.

These wagon standards are attached by means of a bolt which passes through a slot near the bottom. This arrangement permits them to be folded as shown. This idea might be applied in many ways.

Dust Pan.

There is a long handle on this dust pan, which makes it unnecessary to stoop to take up the dust. The notches at the side hold the handle in four different positions.

Electric Steel Furnaces.

Illustrating the growth of electric steel making, there are at present a total of 72 Heroult electric furnaces either in operation for the manufacture of steel, in the course of building, or authorized, in the United States and Canada, and arrangements for a large number of additional furnaces have been made.

All the World's a Stage, and All the Men and Women Merely Players

The Greatest Safeguards Against Temptation

What may be best calculated to keep young people, both young men and young women, out of trouble wherever they may be? These are questions which have been puzzling parents and those interested in the welfare of the young pople all over the country for many, many years. Dr. Fred Winslow Adams of St. Andrew's church in New York has been sending to many prominent men and women in different parts of the country, asking them their opinion on this subject, and the following are some of the answers which Dr. Adams has received:

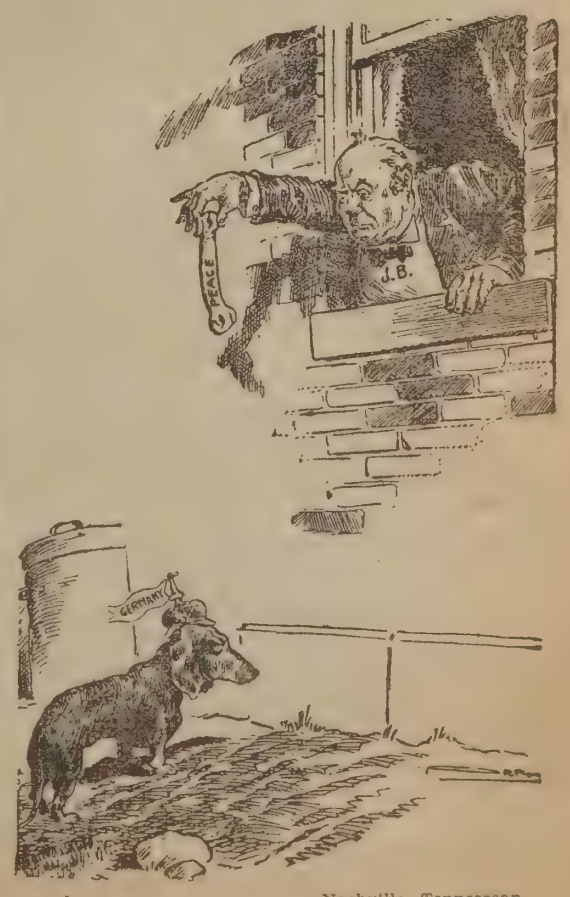
Andrew Carnegie believes high aims to be the greatest safeguard against temptation. Rabindranath Tagore, the Hindu poet, answers, "A healthy interest in good things." Arthur Brisbane says that education, knowledge alone, protects us. Oscar S. Straus thinks we must have the will to resist. Henrietta Crosman says we must recognize God as a present and practical help. Dr. Adams, welding the replies he had received into a composite, declared the real answer to be: "Association with the best as revealed in Christ."

Good Samaritan Buys In "Cop's" Horse

When Mounted Policeman John L. Wendell of the New York police force heard that the department was to auction off "Loughlin," the horse which had served as his mount for a good part of 25 years, he felt as if he had lost his last friend. But now Wendell is happy, and so is "Loughlin," for a good samaritan appeared, bought "Loughlin" and gave him to the policeman as a Christmas present. Loughlin now will lead a life of ease to the end of his days. As the day of auction approached Wendell mourned so much that the story came to be circulated about. E. P. Crissman, a retired real estate dealer, heard it and came to the rescue. Many other old horses were saved from falling into the hands of junk dealers and fruit pedlers by the Bide-a-Week Home society, which purchased them and sent them to a farm to loaf away the rest of their days. A plain is on foot to have the city pension its aged horses of the fire, police and other departments.

Urge Big Army for U. S.

ABOVE - MAJ-GEN. HUGH L. SCOTT.
BELOW - MAJ-GEN. LEONARD WOOD.



General Hugh L. Scott, chief of the general staff, and General Leonard Wood, commander of the department of the east, say that 3,000,000 fully trained troops should be available within 90 days after the outbreak of any war involving this country.

Blessing Instruments of Death

Here a priest of the Greek church is shown blessing the shells that are to open an artillery offensive. The Serbian soldiers believe that shells so blessed never fail to inflict dire losses on the enemy.

"Beg!"

Nashville Tennessean.

THE SON OF THE WOLF

.....BY.....
JACK LONDON

(Concluded From Last Week.)

Mocasins were crunching the snow without. Mackenzie threw his rifle to cock, and loosened the twin Colts in his belt.

"Grant, O chief!"

"And yet will my people say no."

"Grant, and the wealth is thine. Then shall I deal with thy people after."

"The Wolf will have it so. I will take his tokens—but I would warn him."

Mackenzie passed over the goods, taking care to clog the rifle's ejector, and capping the bargain with a kaleidoscopic silkerchief. The Shaman and half a dozen young braves entered, but he shouldered boldly among them and passed out.

"Pack!" was his laconic greeting to Zariska as he passed her lodge and hurried to harness his dogs. A few minutes later he swept into the council at the head of the team, the woman by his side. He took his place at the upper end of the oblong, by the side of the chief. To his left, a step to the rear, he stationed Zarinska—her proper place. Besides, the time was ripe for mischief, and there was need to guard his back.

On either side, the men crouched to the fire, their voices lifted in a folk-chant out of the forgotten past. Full of strange, halting cadences and haunting recurrences, it was not beautiful. "Fearful" may inadequately express it. At the lower end, under the eye of the Shaman, danced half a score of women. Stern were his reproofs to those who did not wholly abandon themselves to the ecstasy of the rite. Half hidden in their heavy masses of raven hair, all disheveled and falling to their waists, they slowly swayed to and fro, their forms rippling to an ever-changing rhythm.

It was a weird scene; an anachronism. To the south, the 19th century was reeling off the few years of its last decade; here flourished man primeval, a shade removed from the prehistoric cave-dweller, a forgotten fragment of the Elder World. The tawny wolf-dogs sat between their skin-clad masters or fought for room, the firelight cast backward from their red eyes and shavered fangs. The woods, in ghostly shroud, slept on unheeding. The White Silence, for the moment driven to the rimming forest, seemed ever crushing inward; the stars danced with great leaps, as is their wont in the time of the Great Cold; while the Spirits of the Pole trailed their robes of glory athwart the heavens.

Scruff Mackenzie dimly realized the wild grandeur of the setting as his eyes ranged down the fur-fringed sides in quest of missing faces. They rested for a moment on a newborn babe, suckling at its mother's naked breast. It was 40 below—70 and odd degree of frost. He thought of the tender women of his own race, and smiled grimly. Yet from the loins of some such tender woman had he sprung with a kingly inheritance—an inheritance which gave to him and his dominance over the land and sea, over the animals and the peoples of all the zones. Single-handed against fivescore, girt by the arctic winter, far from his own, he left the prompting of his heritage, the desire to possess, the wild danger-love, the thrill of battle, the power to conquer or to die.

The singing and the dancing ceased, and the Shaman flared up in rude eloquence. Through the sinuosities of their vast mythology, he worked cunningly upon the credulity of his people. The case was strong. Opposing the creative principles as embodied in the Crow and the Raven, he stigmatized Mackenzie as the Wolf, the fighting and the destructive principle. Not only was the combat of these forces spiritual, but men fought, each to his totem. They were the children of Jelchs, the Raven, the Promethean firebringer; Mackenzie was the child of the Wolf, or, in other words, the Devil. For them to bring a truce to this perpetual warfare, to marry their daughters to the arch-enemy, were treason and blasphemy of the highest order. No phrase was harsh, nor figure vile, enough in branding Mackenzie as a sneaking interloper and emissary of Satan. There was a subdued, savage roar in the deep chests of his listeners as he took the swing of his peroration.

"Ay, my brothers, Jelchs is all-powerful! Did he not bring heaven-born fire that we might be warm? Did he not draw the sun, moon, and stars from their holes that we might see? Did he not teach us that we might fight the Spirits of Famine and of Frost? But now Jelchs is angry with his children, and they are grown to a handful, and he will not help. For they have forgotten him, and done evil things, and trod bad trails, and taken his enemies into their lodges to sit by their fires. And the Raven is sorrowful at the wickedness of his children; but when they shall rise up and show they have come back, he will come out of the darkness to aid them. O brothers! the Fire-Bringer has whispered messages to thy Shaman; the same shall ye hear. Let the young men take the young women to their lodges; let them fly at the throat of the Wolf; let them be undying in their enmity! Then shall their women become fruitful, and they shall multiply into a mighty people! And the Raven shall lead great tribes of their fathers and their fathers' fathers from out of the North; and they shall beat back the Wolves till they are as last year's campfires; and they shall again come to rule over all the land! 'Tis the message of Jelchs, the Raven."

This foreshadowing of the Messiah's coming brought a hoarse howl from the Sticks as they leaped to their feet. Mackenzie slipped the thumbs of his mittens, and waited. There was a clamor for the Fox, not to be stilled till one of the young men stepped forward to speak.

"Brothers! The Shaman has spoken wisely. The Wolves have taken our women, and our men are childless. We are grown to a handful. The Wolves have taken our warm furs, and given for them evil spirits which dwell in bottles, and clothes which come not from the beaver or the lynx, but are made from the grass. And they are not warm, and our men die of strange sicknesses. I, the Fox, have taken no woman to wife; and why? Twice have the maidens which pleased me gone to the camps of the Wolf. Even now have I laid by skins of the beaver, of the moose, of the cariboo, that I might win favor in the eyes of Thling-Tinneh, that I might marry Zarinska, his daughter. Even now are her snowshoes bound to her feet, ready to break trail for the dogs of the Wolf. Nor do I speak for myself alone. As I have done, so has the Bear. He, too, had fain been the father of her children, and many skins has he cured thereto. I speak for all the young men who know not wives. The Wolves are ever hungry. Always do they take the choice meat at the killing. To the Ravens are left the leavings.

"There is Gugkla!" he cried, brutally pointing out one of the women, who was a cripple. "Her legs are bent like the ribs of a birch canoe. She can not gather wood nor carry the meat of the hunters. Did the Wolves choose her?"

"Ai! ai!" vociferated his tribesmen.

"There is Moyri, whose eyes are crossed by the evil spirit. Even the babes are affrighted when they gaze upon her, and it is said the bald-faced gives her the trail. Was she chosen?"

Again the cruel applause rang out.

"And there sits Pischet. She does not hearken to my words. Never has she heard the cry of the chit-chat, the voice of her husband, the babble of her child. She lives in the white silence. Cared the wolves aught for her? No! Theirs is the choice of the kill; ours is the leavings.

"Brothers, it shall not be! No more shall the wolves slink among our campfires. The time is come."

A great streamer of fire, the aurora borealis, purple, green and yellow, shot across the zenith, bridging horizon to horizon. With head thrown back and arms extended, he swayed to his climax.

"Behold! The spirits of our fathers have arisen and great deeds are afoot this night!"

He stepped back, and another young man somewhat diffidently came forward, pushed on his comrades. He towered a full head above them, his broad chest defiantly bared to the frost. He swung tentatively from one foot to the other. Words halted upon his tongue, and he was ill at ease. His face was horrible to look upon, for it had at one time been half torn away by some terrific blow. At last he struck his breast with his clenched fist, drawing sound as from a drum, and his voice rumbled forth as the surf from an ocean cavern.

"I am the Bear—the Silver-Tip and the Son of the Silver-Tip! When my voice was yet as a girl's I slew the lynx, the moose and the cariboo; when it whistled like the wolverines from under a cache, I crossed the Mountains of the South and slew three of the White Rivers; when it became as the roar of the Chinook, I met the bald-faced grizzly, but gave no trail."

At this he paused, his hand significantly sweeping across his hideous scars.

"I am not as the Fox. My tongue is frozen like the river. I can not make great talk. My words are few. The Fox says great deeds are afoot this night. Good! Talk flows from his tongue like the freshets of the spring, but he is chary of deeds. This night shall I do battle with the Wolf. I shall slay him, and Zarinska shall sit by my fire. The Bear has spoken."

Though pandemonium raged about him, Scruff Mackenzie held his ground. Aware how useless was the rifle at close quarters, he slipped both holsters to the fore, ready for action, and drew his mittens till his hands were barely shielded by the elbow gauntlets. He knew there was no hope in attack en masse, but true to his boast was prepared to die with teeth fast-locked. But the bear restrained his comrades, beating back the more impetuous with his terrible fists. As the tumult began to die away, Mackenzie shot a glance in the direction of Zarinska. It was a superb picture. She was leaning forward on her snowshoes, lips apart and nostrils quivering, like a tigress about to spring. Her great black eyes were fixed upon her tribesmen, in fear and in defiance. So extreme the tension she had forgotten to breathe. With one hand pressed spasmodically against her breast and the other as tightly gripped about the dogwhip, she was as turned to stone. Her muscles loosened; with a heavy sigh she settled back, giving him a look of more than love.

Thling-Tinneh was trying to speak, but his people drowned his voice. Then Mackenzie strode forward. The Fox opened mouth to a piercing yell, but so savagely did Mackenzie whirl upon him that he shrank back, his larynx all a-gurgle with suppressed sound. His discomfiture was greeted with roars of laughter, and served to soothe his fellows to a listening mood.

"Brothers! The white man, whom ye have chosen to call the Wolf, came among you with fair words. He was not like the Innuit, he spoke not lies. He came as a friend, as one who would be a brother. But your men have had their say, and the time for soft words is past. First, I will tell you that the Shaman has an evil tongue and is a false prophet, that the messages he spake are not those of the Fire-Bringer. His ears are locked to the voice of the Raven, and out of his own head reweaves cunning fancies, and he has made fools of you. He has no power. When the dogs were killed and eaten, and your stomachs were heavy with untanned hide and strips of moccasins; when the old men died, and the old women died, and the babes at the dry dugs of the mothers died; when the land was dark, and ye perished as do the salmon in the fall; ay, when the famine was upon you, did the Shaman bring reward to your hunters? did the Shaman put meat in your bellies? Again I say, the Shaman is without power. Thus! I spit upon his face!"

Though taken aback by the sacrilege, there was no uproar. Some of the women were even frightened, but among the men there was an uplifting, as though in preparation or anticipation of the miracle. All eyes were turned upon the two central figures. The priest realized the crucial moment, felt his power tottering, opened his mouth in denunciation, but fled backward before the truculent advance; upraised fist, and flashing eyes of Mackenzie. He sneered and resumed.

"Was I stricken dead? Did the lightning burn me? Did the stars fall from the sky and crush me? Pish! I have done with the dog. Now will I tell you of my people, who are the mightiest of all the people, who rule in all the lands. At first we hunt as I hunt, alone. After that we hunt in packs; and at last, like the cariboo-run, we sweep across all the land. Those whom we take into our lodges live; those who will not come die. Zarinska is a comely maiden, full and strong, fit to become the mother of Wolves. Though I die, such shall she become; for my brothers are many, and they will follow the scent of my dogs. Listen to the Law of the Wolf. Whoso taketh the life of one Wolf, the forfeit shall ten of his people pay. In many lands has the price been paid; in many lands shall it yet be paid.

"Now will I deal with the Fox and the Bear. It seems they have cast eyes upon the maiden. So? Behold, I have bought her; Thling-Tinneh leans upon the rifle; the goods of purchase are by his fire. Yet will I be fair to the young men. The Fox, whose tongue is dry with many words, will I give of tobacco five long plugs. Thus will his mouth be wetted that he may make much noise in the council. But to the Bear, of whom I am well proud, will I give of blankets two; of flour, 20 cups; of tobacco, double that of the Fox; and if he fare with me over the mountains of the east, then will I give him a rifle, mate to Thling-Hinneh's. If not? Good! The Wolf is weary of speech. Yet once again will he say the Law: Whoso taketh the life of one

A DIAMOND-SET LA VALLIERE

Yours for a Little Work Among Your Friends

Any of our girl readers may have this beautiful diamond set, pearl pendant la valliere, with solid gold link chain, by obtaining a small club of **NEW** or **RENEWED** subscriptions.

If you would rather have a solid gold shell bracelet, you may earn one in the same manner.

Write us today and we will mail you a personal letter, giving full and complete information.

Premium Dept., Room 37, Review Bldg., Spokane, Wash.

Wolf, the forfeit shall ten of his people pay."

Mackenzie smiled as he stepped back to his old position, but at heart he was full of trouble. The night was dark. The girl came to his side, and he listened closely as she told of the Bear's battle-tricks with the knife.

The decision was for war. In a trice scores of moccasins were widening the space of beaten snow by the fire. There was much chatter about the seeming defeat of the Shamm; some averred he had but withheld his power; while others conned past events and agreed with the Wolf. The Bear came to the center of the battleground, a long naked hunting knife of Russian make in his hand. The Fox called attention to Mackenzie's revolvers; so he stripped his belt, buckling it about Zarinska, into whose hands he also intrusted his rifle. She shook her head that she could not shoot—small chance had a woman to handle such previous things.

"Then, if danger come by my back, cry aloud, 'My husband!' No; this, 'My husband!' "

He laughed as she repeated it, pinched her cheek, and reentered the circle. Not only in reach and stature had the Bear the advantage of him, but his blade was longer by a good two inches. Scruff Mackenzie had looked into the eyes of men before, and he knew it was a man who stood against him; yet he quickened to the glint of light on the steel, to the dominant pulse of his race.

Time and again he was forced to the edge of the fire or the deep snow, and time and again, with the foot tactics of the pugilist, he worked back to the center. Not a voice was lifted in encouragement, while his antagonist was heartened with applause, suggestions and warnings. But his teeth only shut the tighter as the knives clashed together, and he thrust or eluded with a coolness born of conscious strength. At first he felt compassion for his enemy; but this fled before the primal instinct of life, which in turn gave way to the lust of slaughter. The 10,000 years of culture fell from him, and he was a vace-dweller, doing battle for his female.

Twice he pricked the Bear, getting away unscathed; but the third time caught, and to save himself, free hands closed on fighting hands, and they came together. Then did he realize the tremendous strength of his opponent. His muscles were knotted in painful lumps, and cords and tendons threatened to snap with the strain; yet nearer and nearer came the Russian steel. He tried to break away, but only weakened himself. The fur-clad circle closed in, certain of and anxious to see the final stroke. But with wrestler's trick, swinging partly to the side, he struck at his adversary with his head. Involuntarily the Bear leaned back, disturbing the center of gravity. Simultaneous with this, Mackenzie tripped properly and threw his whole weight forward, hurling him clear through the circle into the deep snow. The Bear floundered out and came back full tilt.

"O my husband!" Zarinska's voice rang out, vibrant with danger.

To the twang of a bow-string, Mackenzie swept low to the ground, and a bone-barbed arrow passed over him into the Bear, whose momentum carried him over his crouching foe. The next instant Mackenzie was up and about. The Bear lay motionless, but across the fire was the Shaman, drawing a second arrow.

Mackenzie's knife leaped short in the air. He caught the heavy blade by the point. There was a flash of light as it spanned the fire. Then the Shaman, the hilt alone appearing without his throat, swayed a moment and pitched forward into the glowing embers.

Click! click!—the Fox had possessed himself of Thling-Tinneh s rifle and was vainly trying to throw a shell into place. But he dropped it at the sound of Mackenzie's laughter.

"So the Fox has not learned the way of the plaything? He is yet a woman. Come! Bring it, that I may show thee!"

The Fox hesitated.

"Come, I say!"

He slouched forward like a beaten cur.

"Thus, and thus; so the thing is done." A shell flew into place and the trigger was at cock as Mackenzie brought it to shoulder.

"The Fox has said great deeds were afoot this night, and he spoke true. There have been great deeds, yet least among them were those of the Fox. Is he still intent to take Zarinska to his lodge? Is minded to tread the trail already broken by the Shaman and the Bear? No? Good!"

Mackenzie turned contemptuously and drew his knife from the priest's throat.

"Are any of the young men so minded? If so the Wolf will take them by two and three till none are left. No? Good! Thling-Tinneh, I now give thee this rifle a second time. If in the days to come thou shouldst journey to the country of the Yukon, know thou that there shall always be a place and much food by the fire of the Wolf. The night is now passing into the day. I go, but I may come again. And for the last time, remember the law of the Wolf!"

He was supernatural in their sight as he rejoined Zarinska. She took her place at the head of the team and the dogs swung into motion. A few moments later they were swallowed up by the ghostly forest. Till now Mackenzie had waited; he slipped into his snowshoes to follow.

"Has the Wolf forgotten the five long plugs?"

Mackenzie turned upon the Fox angrily; then the humor of it struck him.

"I will give thee one short plug."

"As the Wolf sees fit," meekly responded the Fox, stretching out his hand.

Buy Victrola for Community.

At a community center meeting held recently at the Bruce school house of Othello, Wash., a box supper was held, the proceeds of which amounted to $83.40, which will be used in purchasing a Victrola and records for the school. There is one inch of snow on the ground, while the ground underneath is perfectly dry, a thing that never happened here before. Stock is going into winter quarters and is looking fine. A. O. LEE.

Homework for Pupils.

Superintendent W. M. Kern of the Walla Walla schools announced plans for the enlarging of the agricultural department of the high school to include extensive home work as essential to graduation in the course. Superintendent Kern wants each pupil to put in a year's actual work in some line of agriculture upon a small plot of ground, at his home or somewhere in the city, in connection with his regular course at the high school.

Necessities

Let Them Go to Highest Price

Mr. Perkins, the writer of the following letter, is a member of the executive committee of the American National Live Stock association. We are glad to publish this letter continuing the discussion of the great problem of the high cost of living:

Mr. Perkins Letter.

To the Editor of the Washington Farmer: I have yours relative to the high cost of living. I note what Dr. E. A. Bryan says regarding the matter. He is right as far as he goes. We have too many consumers and not enough producers. A large per cent of the people have moved to the towns and cities where they can see the sights and do not produce anything. Yet they want those who do produce something to sell it cheap so they can remain in the town. There is one way to stop this trouble and that is to let necessities of life go to the highest. Price them so a man will have to have a good income or go to the country and produce the greater part of his living. We have too many people in town and we have a large per cent of men that tell the people to move out in the country and raise their families in the country, yet they remain in town with their own families.

I want to see the trade remain open. Let those that think the cost of living is too high get out and produce something to live on. Let the producers get all they can for what they have for sale. All of this howl about the high cost of living is from people that do not produce anything to live on.

M. A. PERKINS.

Puntenney, Arizona.

Class in Road Building.

Instruction in methods of better road building will be given at the state college at Pullman this winter, under the supervision of L. V. Edwards, professor of railway and highway engineering at the college.

KEMP & HEBERT
SPOKANE WASH.

All Mail Orders Sent Free Within Two Hundred Miles of Spokane

ALWAYS A PLENTY OF WARM THINGS FOR THE MAN AND BOY

and Always a Little Less to Pay

Extra Heavy Men's Sox, All Wool, Hand Knit, a Pair 75c

These sox are to take the place of the felt or German sox, being less bulky and just as warm.

MEN'S HEAVY WOOL MACKINAWS 8.50.

Extra heavy mackinaws, extra well made, with large pockets. Not skimped in any way. Mostly brown, gray and blue plaids.

MEN'S EXTRA HEAVY WOOL TROUSERS 3.50, 4.50, 5.00.

We are fortunate in securing a big shipment of men's extra HEAVY CRAVENETTED TROUSRES. a feature not usually seen in men's trousers. Every new feature that can be added to make OUR TROUSERS give better service is added.

BOYS' BROWN FLANNEL SHIRTS 1.39.

These shirts are the extra heavy weights. Sizes 13, 13 1-2, 14, 14 1-2, with military or REGULAR COLLARS ATTACHED.

BOYS' "HAND KNIT" STOCKINGS .65.

These all wool stockings are extra heavy weights and well reenforced where it's most needed—GIVING THE EXCEPTIONAL durability.

6.00 TO 10.00 BOYS' HEAVY OVERCOATS 3.48.

To Fit Boys 15, 16, 17 Years.

These are splendidly warm overcoats, full lined throughout. Come in medium and dark gray mixtures. Coats that sold in our stock at from six to ten dollars each. While they last 3.48

HEAVY WOOL SOX .35 PAIR.

Men's heavy white and gray wool sox for extreme weather, a pair ..... .35

Three pairs for 1.00

WOOL GLOVES .35, .50, .65.

Medium and heavy weight leather mitts, warmly lined, with knit wrists. Big lines at .50, .65, .75, .98, 1.25 pair

WINTER SHIRTS AND DRAWERS .50 EACH.

Cotton ribbed or fleece lined. A garment ..... .50

WINTER UNION SUITS 1.00.

We specialize on a good union suit at a smaller price than you expect. These are ribbed and fleeced and standard style.

TAILORED SHIRTS .63.

Flannelette shirts, tailored, with flat or military collars. Gray color.

Mixed wool shirts, in staple colors 1.50, 1.75

Tailored flannel shirts are 2.00, 2.50

Words

Fit Thoughts of Men and Women

Words are found or words are made to fit the thoughts of men and women. When thoughts are shallow, words describing them are shallow; when thoughts strike into the very issues of life, words clothing those thoughts will be very much alive.

Words fall into wayside minds and the fowls come and devour them. Words fall upon stony places and forthwith shallow thoughts spring up and when the sun arrives they are scorched, and because they have not root they wither away. Some words fall among thorns and the thorns spring up and choke them. Thoughts also fall into good ground and bring forth fruit, some a hundredfold, some sixtyfold, some thirtyfold, and these are the words that live among men.

"They are never alone that are accompanied with noble thoughts," is expressive of Sir Philip Sidney's life.

This from Shakespeare: "The miserable have no other medicine, only hope."

With Bacon look back into the past: "Cato said the best way to keep good actions in memory was to refresh them with new."

Thomas Heywood: "I hold he loves me best who calls me Tom."

I am now thinking of the man who is managing editor of one of the greatest daily newspapers on the Pacific coast. I knew him many years ago when he was working on a newspaper in the state of Maine. One day he told me of his boyhood experiences. His father died and he was helping out the family income by cleaning out the spittoons and doing every sort of chore in the business place of a grasping New England Yankee. Those were hard days for the young lad. He said the only thing that kept up his courage was to repeat over and over again to himself that line from Longfellow, "Learn to labor and to wait."

Now, what is the quotation or what are the words which have helped you in the journey of life?

Is it a phrase from some famous author or was it the words from some neighborly soul who helped you over a hard place and left you the invaluable legacy of a life motto?

What are your favorite motto, your favorite quotation, your favorite words?

Send them to the Editor of the Farmer and let those words help another which have helped you.

Bread

Condition of Yeast Important

The condition of the yeast used in bread making is more important than the kind of yeast, according to Miss Addie D. Root of the Missouri College of Agriculture. If yeast is allowed to stand in a dusty place or is put into an unsterilized vessel, it will collect bacteria and the bread will have a sour, unpleasant taste. All utensils and liquids should be scalded before using.

Yeasts are small plants which need air. Flour, therefore, should be added slowly and beaten into the liquid thoroughly to incorporate air. Sugar is food for the yeast plant and if given to it will hasten its growth.

If dough it too stiff, a harsh, crumbly bread results. The least amount of flour possible to avoid a sticky dough gives the best bread.

Kneading.

The quick even stroke in kneading counts for more than the strength put into it. A thorough kneading distributes the yeast plants evenly throughout the dough and results in bread of the best texture as the gas bubbles rise evenly. Dough should be kneaded until it has a smooth velvety surface. If kneaded longer than 30 minutes the elastic quality is completely destroyed.

Yeast plants thrive at a temperature of from 79 to 95 degrees Fahrenheit. When dough is set to rise it should be placed in a clean bowl. If the bowl is covered tightly and an even temperature maintained, it is not necessary either to oil or moisten the surface to prevent a crust from forming. If the temperature is too high, the bread will be dark, coarse and sour. If the dough is chilled while rising, the volume will be smaller, the texture rubbery and an undesirable crust will form. Best results are obtained when dough is kept at a gentle, warm, even temperature until it is twice its bulk, and then worked.

Baking requires as much care as mixing, kneading and rising. The temperature of the oven should be 360 degrees Fahrenheit when the bread is placed in it. It should be allowed to rise after 15 minutes and lowered after 30 minutes. The bread should begin to brown in patches during the first 15 minutes and should have an even brown surface after 30 minutes. It the dough is not twice its original bulk or as light as desired, it may be allowed to finish rising in the oven.

Boy Nature

Has Not Radically Changed

Boy nature has not changed radically through the years. Civilization has tempered it, but has not eradicated it.

The boy on the farm 40 years ago can be duplicated when it comes to essentials by the boy on the farm in this year of our Lord 1917.

While this is true, yet it is just as true that environments have changed and that there is no single factor which molds and develops or distorts and arrests the development of the boy, as does environment.

All this is merely calling attention to the fact that the particulars in the treatment of the boy a half century ago on the farm and the particulars of the treatment of the boy today on the farm are not identical, but are widely different.

Give the boy a square deal is the exhortation of the Pittsburg Dispatch, which says:

One of the more practical of the psychologists directs the attention of fathers to the fact that ought not to need pointing out, that there is too much difference between the social environment of today and that of 40 years ago to make it possible for the boy of today to be much like the boy of that time, or that the man of today trying to gage the tendencies of his boy-time with that of now need be depressed because convinced something serious is wrong with his boys. Forcing the doings of the boy of 1916 to square up with the boy of 1870 is unfair to the boys of today.

The same principle applies to the girls of today as compared with the girls of 40 years years ago. Times change and the sources of encouragement and inspiration change with them.

Foods

Correct Combinations for Dinner

Some foods are high in only one kind of food material and so serve only one or possibly two bodily needs, says Edna E. Walker of the Washington State college. They may be good foods, but should be combined with other foods to make a balanced meal.

With beef steak: Fried onions, French fried potatoes, mushrooms, string beans, stewed carrots.

With Roast beef: Mashed potatoes, corn, tomatoes, carrots, cabbage or greens.

With pot roast or boiled beef: Cream horseradish sauce, boiled potatoes, stewed tomatoes, cabbage.

Swedish Milkmen.

Swedish milkmaids are being displaced by men who are taking up work that was formerly regarded as purely for women.

Popular Crochet Designs

By WINIFRED WORTH

Nun's Pattern.

This novel pattern is much used by the nuns, who thus put their time to good use while in seclusion.

1st row—Ch. 8, join in ring with sl. st., 3 t. in ring, ch. 3, 3 t. in same ring, 4 knot st. (to make pt. st, draw st. on needle out of one-fourth inch, thread over needle, pull through, catch needle through lower of three threads on loop, thread over needle and pull through, leaving 2 sts on needle, thread over and pull through both sts., ch, one, tighten to knot), repeat until 4 sts. have been made, ch. 6, fasten by sl. st. in last kt. made, 3 t. in ch. of 6, ch. 3, 3 t. in same ch., turn.

2nd row—Ch. 3, 3 t., 3 ch., 3 t. make kt. st. 1, fasten in last kt. st. made, repeat until 4 kts. sts. have been made, 3 t. in ch. of 1st shell, ch. 3, 3 t. in same ch., ch. 3, turn.

3rd row—Shell in shell, make kt. st., fasten by 3 dc. in top of kt. st. Make kt. st. and dc. in 1st of center kt. of group, ch. 5 and sl. st. in last st. of center group. Make kt. and shell in shell, ch. 3, turn.

4th row—Shell in shell, repeat kt. st. until center ch. of 5, 15 t. in center ch. of 5, repeat kt. st., shell in shell, ch. 3, turn.

5th row—Repeat 4th row to center 15 t., 5 t. in 1st 5 t., 2 kt. sts. 5 t. in 2nd 5 t. of 15, 2 kt. sts., 5 t. in 5 last tr. of 15, repeat 4th row to end, ch. 3, turn.

6th row—Shell in shell, thread 3 times over needle, go into 1st st. of last group of 5, knit off 2 at a time until 2 remain on needle, repeat and go into 2nd t., knit off, leaving 3 sts. off needle, thread over twice into 3rd t., knit off, leaving 4 sts. on needle, repeat, leaving 5 on needle, thread over once and into 5 t., knit off 2 at a time, leaving 1 st. on needle, make kt. and repeat twice more. Shell into shell, ch. 3, turn.

7th row—Same as 3rd, repeat from 3rd row for desired length.

Bedbugs

Use of Cyanide Is Dangerous

In response to requests coming to the state experiment station regarding the use of cyanide in fumigating for bedbugs, Dr. A. L. Melander, entomologist, gives the following pointed advice:

First of all do not use cyanide fumigation unless the case is so aggravated as to warrant the risk, for cyanide is a most subtle and subtly diffusive poison. Because its gas is colorless and virtually odorless the danger attending its use is often not appreciated and if it is carelessly employed it might have as disastrous results on the people living in the house as on the bugs.

The commonest prescription for bedbugs is a mixture of one ounce of corrosive sublimate in a pint of alcohol to which is sometimes added four ounces of turpentine. This liquid may be squirted by means of a small syringe into cracks around the beds, around mopboards, in back of picture frames or other hiding places where the bugs live.

Fashion Hints.

An attractive yet conservative sports costume is a steel-gray Angora sweater, which clings to the body, the novel feature of which is the front of the self fabric, but having large coin spots of Alice blue. The back and sleeves are of plain gray, and with it is worn a gray mixed tweed sports skirt and scarf of Alice blue silk jersey. The sweater has two breast and two hip pockets of mannish style.

Serge and Flannel for Trimming.

It appears to be so much cheaper to make cotton velvet than wool fabrics that we are prepared to see the new frocks and suits of bright colored velveteens piped and bound with bits of blue and red serge. A fashion expert in New York, a man who designs as many dresses as he discusses, is leading his patrons to the idea of silk and cotton frocks trimmed with flannel, of even khaki-kool brought out two months before its time and togged with heavy trimmings to appease the season.

The Latest Addition to the "Set."

The newest sets of hats and scarfs include long mittens with gauntlet-shaped wrist portion.

Fats as Food.

The number of edible fats in use has been greatly increased in recent years, a bulletin of the United States department of agriculture points out. Formerly butter, cream, and lard, and perhaps "meat drippings" were the only edible animal fats known to the average housewife. Now numerous cooking fats are made from vegetable oils or mixtures of vegetable and animal fats. The development of methods of treating liquid oils to harden them by the addition of hydrogen has added a number of cooking fats of the approximate consistency of lard to the fats available for home use. Among the edible vegetable fats mentioned by the bulletin, which are used for food purposes, are olive oil, cottonseed oil, peanut oil, cocoanut oil, corn oil, soy bean oil and nut oils.

Apple Sauce Cake.

The following recipe requires no milk or eggs:

One cup of apple sauce, one teaspoonful soda stirred in sauce, one cup sugar, one cup raisins, one-half cup of butter or lard (if lard use a pinch of salt), two tablespoons of cocoa or chocalate, one teaspoonful each of cinnamon, cloves and nutmeg.

The batter should be more stiff than ordinary cake. Bake in a moderate oven. This amount makes a small loaf. If allowed to age a couple of weeks it will have a nicer flavor and when covered with a white icing makes a good dark cake for the holidays. E. Q.

Irish Laborers' Acts.

In addition to the administration of the poor relief law and the public health acts, the local government board of Ireland has administered oversight of the so-called laborers' acts, the purpose of which is to put Irish laborers into possession of agricultural holdings, assist them by means of money grants for the purchase of holdings, provide them with cottages, assist them in agricultural operations, etc.

Patterns

1915—Ladies' Apron—Cut in three sizes: Small, medium and large. Medium size requires four and one-eighth yards of 36-inch material. Price, 10 cents.

1929—Ladies' Kimono or Lounging Robe—Cut in four sizes: 34, 38, 42 and 46 inches bust measure. It requires seven and one-eighth yards of 36-inch material for a 38-inch size. Price, 10 cents.

1472—Girls' Dress. Cut in four sizes: 4, 6, 8 and 10 years. It requires three yards of 56-inch material for a 6-year size. Price, 10 cents.

1918—Child's Rompers—Cut in three

sizes: 2, 4 and 6 years. It requires three yards of 36-inch material for a 4-year size. Price, 10 cents.

1628—Ladies' Corset Cover and Drawers. Cut in 3 sizes: Small, medium and large. It requires three and one-half yards for a medium size, in 36-inch material. Price, 10 cents.

1942-1943—Ladies' Costume. Waist 1942 cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt, 1943, cut in six sizes: 22, 24, 26, 28, 30 and 32 inches waist measure. To make the entire dress of 44-inch serge will require six and three-quarter yards. The skirt measures about three and three-quarters yards at the foot. Two separate patterns, 10 cents for each pattern.

Invalids

Some Dishes That May Attract

In the selection and serving of foods for the invalid, cleanliness in the extreme is of first importance, says Nora K. Andrew in the women's institute of the British Columbia department of agriculture. We all know how unpleasant it is to find some foreign matter in our food, but such an incident is many times worse for one who is ill. Foods that are eaten raw should be chosen because of their quality, such as fruits, celery, lettuce, oysters, etc., and they should be particularly well washed, for they are not sterilized by cooking as other foods. Milk and its products must be unquestionably fresh and free of taint, and meats, fish and eggs are to be rejected if there is any doubt as to their freshness. Food that has been contaminated by foreign odors is to be avoided, as an invalid is very sensitive to such things. We all know, at least all who have been ill in bed, that the time is very long and that meals are breaks in the long days, so the meals should be made as appetizing as possible and served in an attractive manner. The dishes should be well washed, the glass and silver be polished, and the traycloth and serviette clean beyond a doubt. When the dishes are returned, they should be washed with hot water and soap, not merely soaked, and if the case is infectious they should be disinfected in a solution of carbolic acid or formalin and then rinsed in clean hot water. As an invalid finds the time passing slowly, so a change of dishes often affords some diversion by studying the pattern, as one gets tired of counting the cracks in the ceiling or tracing out the pattern on the wall paper.

The following are some dishes that should appeal to the invalid:

Albumen Water.

One white of egg well beaten in a tumbler, 1-2 tablespoon of sugar, juice of one lemon. Fill tumbler with water, beat well, strain and serve.

Gruel.

One-quarter cup oatmeal, 1 quart water, 1 teaspoon salt. Cook two hours in double boiler, strain and serve as desired, with white of egg beaten or cream.

Malted Milk and Currant Jelly.

One tablespoon Horlick's malted milk, 1-4 cup hot water, 1 tablespoon currant jelly, 3-4 cup cold water, cracked ice. Mix the malted milk powder with a little of the boiling water to make a smooth paste; add the jelly and the rest of the water and stir till the jelly is dissolved. Add the cold water and ice, strain and serve.

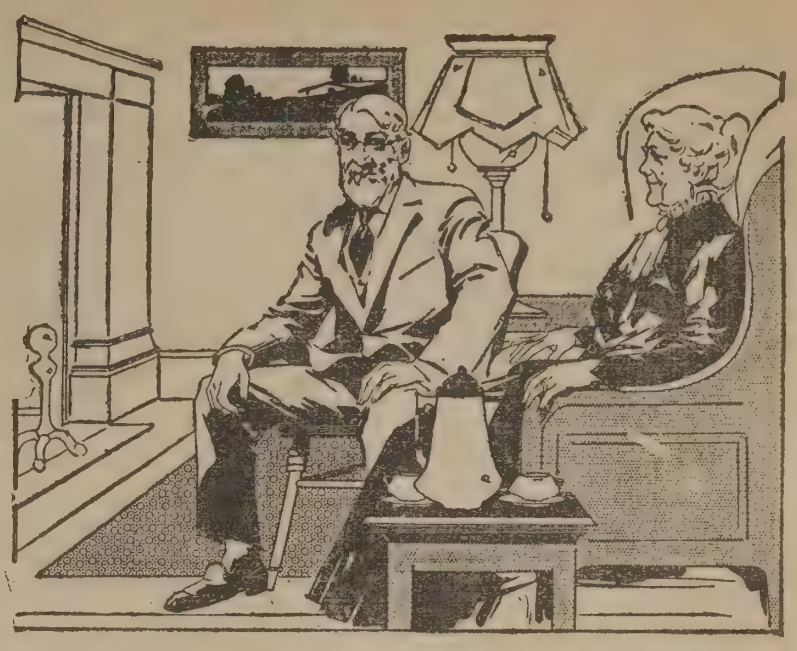
Salisbury Steak.

One-half pound steak. Scrape on both sides until nothing is left but tough fiber. Mould the scraped meat into a little cake and broil it over coals until hot, not too long. Season and serve on toast. Often scraped beef on toast is good.

Junket Egg-Nog.

One egg, 3-4 tablespoon sugar, speck salt, 3-4 cup milk, 1 tablespoon brandy or wine. Beat egg, add sugar, salt and milk, shake well, add stimulant and serve.

Toast Water.



One cup toast, salt, 1 cup boiling water. Toast well in oven, break and measure, add water, let stand 1 hour, rub through strainer, serve hot; milk or cream may be added. Rice water is made the same.

Coddled Eggs.

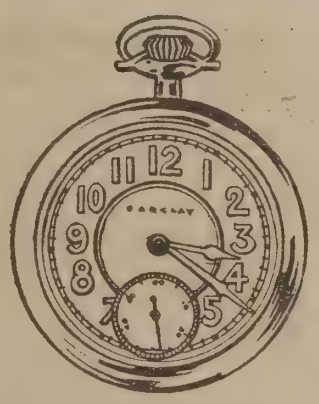
Put eggs in a pan of boiling water, remove from stove, let stand for 10 minutes, serve. Eggs poached in boiling milk with butter and seasoning in makes a nice change.

WANT A LAVALLIERE?

Girls, join our Lavalliere club and get a beautiful solid gold diamond set, pearl pendant lavalliere. Nothing is required but a little of your time. Write Washington Farmer, Room 37 Review building, Spokane, Wash.—Adv.

"John, I haven't missed my cup of Ghirardelli's Ground Chocolate for forty years."

Ghirardelli's Ground Chocolate



is used in more than a million homes in the West.

It comes PROTECTED—as all chocolate should—in ½-lb., 1-lb., and 3-lb. hermetically sealed cans.

Neutrals Favor Peace

Smaller Nations Give Wilson Support

The eyes of all the world, which have been centered on the battles of the European war for the last two and a half years, are now watching the movement toward peace even more interestedly. A few notable incidents in the peace propaganda have been recorded during the last few days.

President Wilson's note, asking that the warring nations make known the terms that they would require before peace could be restored, brought from Germany an immediate reply that she favored a peace conference at once, and that on the first day of such conference would present her definite peace terms. There have been hints that such terms will be delivered confidentially to President Wilson for his own information in his movements to bring peace. The president has, however, indicated that until there is some further development in the situation, he will not take further formal action.

The entente allies (England, France, Russia and Italy) continue to show no willingness to consider peace on any other terms than those largely favorable to them. The Spectator, a London publication, gave what it considered the entente allies' terms in an issue last week, such terms including four specially vital features: (1) That Germany and her allies restore all the territory taken during the war, and also Alsace-Lorraine to France. (2) That Germany and her allies pay a full money indemnity for all destruction done by their armies and navies. (3) That Constantinople and the Dardanelles be placed under Russian control. (4) That the German navy be virtually dismantled or distributed among the entente allies.

Since these terms would mean a virtual annihilation of Germany, the Spectator's article might appear a step away from rather than toward peace.

Another significant incident of the week was the sending by the Scandinavian nations—Norway, Sweden and Denmark—of notes strongly supporting President Wilson's plea for consideration of peace terms by the belligerents.

During the week also the government of Spain sent a vigorous protest to the German government against alleged illegal and inhuman destruction of property at sea.

U. S. Exports Heavy.

During the year just closed the United States has exported foodstuffs to Europe at the rate of $60,000,000 a month, making the total for the year something like $700,000,000. Of these exports, breadstuffs formed the major part, totaling about $400,000,000 in value. Meat and dairy products totaled over $240,000,000.

Bank Resources Large.

The resources of the national banks in the United States now approximate $15,500,000,000,000, an increase of more than $4,000,000,000 over two years ago. These resources are almost equal to those of all the other similar banking systems in the world.

No Coal From Canada.

The Canadian government has placed an embargo on shipments of coal. This means that until it is lifted there will be no more coal shipped into the Unitedo States from Canada, and may tend to aggravate the fuel shortage situation.

Wage Law Situation.

The railroad officials and the representatives of the trainmen involved in the wage controversy which brought about the passage last fall of the "eight-hour" law by congress, have failed to agree on the payment of the wages provided by the law. What has something the appearance of a wide split between the two parties occurred at a New York conference last week, when the railroads declared they would not under any circumstances pay the increased wages until the supreme court had passed upon the constitutionality of the law. The court is now considering the measure, attempting to render an early decision on it.

In the meantime the railroads have agreed to keep a record of the employes affected by the law, so that, if it is held to be valid, they may receive back pay from the date the law was intended to become effective to the date of the supreme court's coming decision.

Talk is still heard of a strike similar to that threatened last fall, when the trainmen's threat caused President Wilson to rush the so-called eight-hour bill through congress.

Less People on the Farms.

A large percentage of the people of Australia lives in the principal cities of the different states.

Sydney, with a population of 763,000, represents over 40 per cent of the people of New South Wales.

Perth, with a population of 122,000, represents 38 per cent of the inhabitants of Western Australia.

Brisbane, with 162,000, represents nearly 24 per cent of the people of Queensland.

Hobart, with 40,000, has under 20 per cent of the people of Tasmania.

Melbourne, with a population of 684,000, contains 48 per cent of the total population of Victoria.

Adelaide, with 205,000, has over 46 percent of the people of South Australia.

Dining Car Potatoes.

Old alfalfa ground in Benton county, Wash., near White Bluffs, proved its value in raising fancy potatoes for the railroad dining car use. W. H. Keal planted 12 sacks on approximately two acres and is reported to have harvested a trifle over 700 sacks that averaged between 110 and 115 pounds. He sold the bulk of them for $30 per ton, but has saved out better than a hundred sacks of the best for seed for himself and neighbors.

School Has Basket Social.

Word comes from Hoper in Whitman county that the Daisy school broke all local records with a basket social which brought in $81.

Good Roads

Advocates Concrete Foundation

During the last few years $250,000,000 has been provided for road building and road improvement in New York state. Of the last $50,000,000 bonds issued for highway construction some $20,000,000 remains to be expended. With regard to the expenditure of these vast sums and as to the character of the roads upon which they can be most profitably spent Professor Arthur H. Blanchard, of the highway engineering department of Columbia university, says:

"In my opinion, in the construction in the future of main trunk highways in this state, the foundation should be of concrete. A well constructed broken stone foundation costs practically as much as concrete and has nowhere the strength. It has recently been recommended to the governor that all trunk highways be constructed of concrete."

Edwin Duffy, New York state commissioner of highways, says: "All the counties want roads. If we listen to all these demands we would build roads at a cost of $5000 a mile that would not last a year," adding: "In the 7000 miles of state highways we unfortunately have only 700 miles of cement pavement construction, but we are building more of it."

Elks Damage Fruit Trees.

R. B. Miller of Startup, in Snohomish county, the other day shot and killed an elk, a so-called ward of the county, while it was in his orchard damaging his trees. During the past few years elks have caused damage to his orchard and crops of not less than $2000 and not being able to get relief from the county "Bob" decided to see what the courts would do for him. He pleaded guilty to having killed the elk and after a trial in justice court in Everett was fined $20 and costs. The case will be carried to the state supreme court if necessary so that a final decision may be had on the matter in this state.

Waterproof Knapsacks.

Waterproof knapsacks made of horse hair have been invented by a Japanese army officer.

When Knighthood Was in Flower

Watch for the opening chapters of the next serial, "When Knighthood Was in Flower," in The Washington Farmer of January 18.

You will surely regret it if you do not read this thrilling story of the olden days. Your neighbors and friends will be asking you about it.

Here are two or three paragraphs from chapter I.

It sometimes happens, Sir Edwin says, that when a woman will she won't, and when she won't she will; but usually in the end the adage holds good. That sentence may not be luminous with meaning, but I will give you an illustration.

I think it was in the spring of 1509, at any rate soon after the death of the "Modern Solomon," as Queen Catherine called her old father-in-law, the late King Henry VII., that his august majesty Henry VIII., "the vndubitate flower and very heire of both the sayd linages," came to the throne of England, and tendered me the honorable position of Master of the Dance at his sumptuous court.

As to "worldly goods," as some of the new religionists call wealth, I was very comfortably off; having inherited from my father, one of the counselors of Henry VII., a very competent fortune, indeed. How my father contrived to save from the greedy hand of that rich old miser so great a fortune, I am sure I can not tell. He was the only man of my knowledge who did it; for the old king had a reach as long as the kingdom, and, upon one pretext or another, appropriated to himself everything on which he could lay his hands. My father, however, was himself pretty shrewd at money matters, having inherited along with his fortune a rare knack for keeping it. His father was a goldsmith in the time of King Edward, and enjoyed the marked favor of that puissant prince.

Being thus in a position of affluence, I cared nothing for the fact that little or no emolument went with the office; it was the honor which delighted me. Besides, I was thereby an inmate of the king's palace, and brought into intimate relations with the court, and, above all, with the finest ladies of the land—the best company a man can keep, since it ennobles his mind with better thoughts, purifies his heart with cleaner motives, and makes him gentle without detracting from his strength. It was an office any lord of the kingdom might have been proud to hold.

The Washington Farmer congratulates its host of readers on securing the rights for the publication of this serial, bright, historical, thrilling—treating of the romantic era in the world's history when

"There lived a knight, when knighthood was in flow'r,
Who charmed alike the tilt-yard and the bow'r."

Important Business Opportunity WRITE AT ONCE

WE will assign valuable territory now open, to energetic, reliable men to handle McConnon's Products. You are sure of permanent, profitable, steadily increasing trade, and will own and control business. Capital and previous experience not required. We give complete instruction and valuable co-operation. No uncertainty or risk. McConnon's Products are used by farm homes everywhere. McConnon & Company is thoroughly established and financially responsible. Read Mr. LaDow's statement below. Can give names of hundreds of McConnon Dealers just as successful. Openings limited—Opportunity exceptional for right men. Write at once for full information.

McCONNON & COMPANY
333 THIRD ST. WINONA, MINN.

I have been selling McConnon's line in this territory for 8 years. My sales were very satisfactory right from the start and have been steadily increasing. I have survived all kinds of competition as McConnon's line is more satisfactory than goods sold by others. McConnon's take a personal interest in their wagon dealers and an inexperienced man has a much better show for success with them than with other concerns. A number of my friends and aquaintances have engaged with my company and have done well, so I consider it a good business for any ambitious man to get into.

Thos. H. LaDow

GUESSES ABOUT THE SIZES AND AGES OF THE COUSINS

Dear Aunt Nellie: I have a little The Farmer and I have been reading the Children's Corner. I enjoy it very much now, but first when I started reading it I thought that every one wrote the same thing. Now I read the letters slowly and guess about the size and about the eyes and hair of the girl or boy. I don't really know what I would do now if I didn't have the Corner. I am a girl of 12 years and I live on a 30-acre farm. I have light hair, blue eyes, and I weigh somewhere in the nineties. We have nine head of cattle, two horses and over a hundred chickens. I haven't any dog or cat for my pets, but I have two pet hens that I can carry around as much as I want to. When they were small I used to catch them in a corner of the barn and let them eat wheat from my hand, and finally they became so tame that I could pick them up and carry them around. One of my pets is 4 years old and the other is 2. Their names are Pretty and Blackie. I have much fun with them. I haven't any brothers or sisters, but there are a lot of girls around here that I can go to see, so I am not lonesome. I like the farm and I wouldn't trade with any city girl. I have only one mile to go to school. I walk to school every day when it is nice, but in the winter I sometimes ride in a sled when it is snowy. The schoolhouse is very large and there are six rooms in the building. In my room there are 39 pupils, 18 in the fifth grade and 21 in the sixth. I'm in the fifth grade and my teacher's name is Miss Haycox. I like her very much. My favorite studies are reading, spelling and arithmetic. We had two families over for Thanksgiving dinner and there was a man over that was jolly and he made us laugh. I have an organ and I'm taking music lessons every Saturday. My music teacher's name is Miss Clara James. I can tat and crochet, and I help mama by sweeping, dusting and washing dishes. I would like to correspond with my twin Fernie Park and with Esther Carslin if they will write, or any other girl of my age. I hope all the girls of the Children's Corner had a good time Thanksgiving.—Agnes Lund, R. 1, Rochester, Wash.

LILLIAN WOTTON BECOMES A MEMBER OF THE CORNER

Dear Aunt Nellie: I have never written to the Children's Corner before, and I want to join the Corner. I will write and tell you about my schoolhouse. It has only one room and it has an anteroom where we children keep our lunches and coats. We also have a filter in the anteroom. There are about 24 desks and the stove is in the middle of the room. There is a platform on the left of the door as you go in. The teacher's desk stands on it. We have an organ at our school. I walk one-quarter of a mile to school. I am 11 years old and have three brothers and did have three sisters older than I, but one is dead. I have auburn hair and blue eyes and a light complexion. My father has a Metz car and we also have two work horses named Myrtle and Jumbo and one pony named Pet, one colt named Babe. We also have a polly parrot and two canary birds. I live on a 120-acre farm.

LILLIAN AMANDA WOTTON.
Friday Harbor, Wash.

CHELAN GIRL WISHES TO CORRESPOND WITH IDA DILIO

Dear Aunt Nellie: I have never written to the Children's Corner before. I like the letters very much. Every time the Farmer comes I am very anxious to read the letters in the Corner. I am 12 years old and in the seventh grade. My birthday was December 9. I would like to correspond with Ida Dilio. We have three horses and 18 head of cattle, six milch cows, and five calves and seven young stock. I live on a farm of 160 acres. We have two large cats and four little cute kittens. I have a brown and black dog called Rex. I have three sisters and one brother. I have a very nice little niece. She is two years old now. She can talk some and is very pretty. Her name is Elizabeth Jane O'Neal. I shall describe our schoolroom. It is large with the blackboard on the north side. It has an organ and the teacher's desk. There are eight windows in the schoolroom. There also are two halls. One is for the coats and caps, the other one is for the teacher. Her name is Miss Burklund.—Elizabeth Lucas, Chelan, Wash.

GIRLS SERVE HOT LUNCHES AT FRED MICHAEL'S SCHOOL

Dear Aunt Nellie: My papa takes The Farmer and I have been reading the children's letters. I like them very much. This is the first time I have ever written to the Children's Corner. I was 8 the eighth of last March. I have a pony and papa paid for it. I have two brothers and a sister and their names are Ella, Charles and Warren. Ella is 7 years old. Charles is 5 and Warren is 3. We built a new schoolhouse. They built a cottage for the teacher. There are 19 scholars in school. The girls serve hot lunches in the winter. I live three miles from school. I am in the fourth grade.—Fred Michael, Davenport, Wash.

NINE-YEAR-OLD ELIZABETH HAS BLACK AND WHITE CAT

Dear Aunt Nellie: I have been reading the letters of the Children's Corner and I have enjoyed them very much. I was nine years old October 26. I have three sisters. The oldest one's name is Katherine and the other one's name is Margaret. The smaller one's name is Helen. I have two brothers. The oldest one is four years old and is named Robert. The smaller one's name is Ray. My sister and I have a pet pig. We call him Sandy. I also have a pet cat. She is black and white. I am in the third grade. I would like to win a prize, but I don't know what to do.—Elizabeth Bowen, Oroville, Wash.

HAS A PET ROOSTER THAT EATS WHEAT FROM HER LAP

Dear Aunt Nellie: This is the first time I have written to the Children's Corner. I have read every letter that I have seen in The Farmer. I walk two miles to school every day. I am 11 years old and in the fourth grade. My teacher's name is Miss Ruth Wilson. I have two pet dogs and their names are Teddie and Rover. I have a pet Rooster. When I go to feed the chickens it jumps up on my lap and tips my pail over and eats all the wheat. I have a little nephew. He is eight months old and his name is Alvin.—Marie Anderson, R. F. D. No. 1, Kalama, Wash.

TAKES CARE OF THE HORSE; HELPS MOTHER IN MANY WAYS

Dear Aunt Nellie: This is the first time I have written to the Children's Corner, but hope it is not the last time. I live on a 40-acre farm two and a half miles west of Winlock. We have seven milch cows, one heifer, one calf and a pig. We have a horse named Dick. When father works at the mill I have to take care of our horse and help mama in many ways. I am in the sixth grade at school, and 10 years old, or will be 11 on June 25. I have a sister and her name is Viola. She is 7 years old and is in the second grade. Our teacher's name is Miss Emma Viste. We go three-quarters of a mile to school. I have seen only Mary Roppert's letter from Winlock.—Warner Payhonen, Box 152, Winlock, Wash.

KTHERINE IS A HALLOWE'EN GIRL; HAS SHE A TWIN?

Dear Aunt Nellie: I am a Hallowe'en girl. I was eight years old last Hallowe'en. Have I a twin? My sister and I have about 90 White Leghorn chickens. We have five horses, one Jersey cow and 15 hogs on the ranch. This is a 100-acre orchard tract. My papa is foreman here. We have a car and we enjoy it very much. I like to go to school. My teacher's name is Mr. Fellmey. I live a half mile from school. There are nine pupils in our school.—Katherine Bowen, Oroville, Wash.

ELLA SHARP HAS SEVEN BANTAMS FOR HER PETS

Dear Aunt Nellie: I am 9 years old and will be 10 March 8. I am in the fourth grade. I have two sisters going to school. The older one is in the seventh grade and the other one is in the fifth grade. I have a pet dog, and his name is Jack. I have seven pet Bantams, and they lay in the summer and winter time. I have a horse, and her name is Muggens. She is a buckskin.—Ella Sharp, Malaga, Wash.

PUPILS AT REARDAN HAVE FUN WITH A FOOTBALL

Dear Aunt Nellie: It is a long time since I have written to The Farmer. I am 11 years old. I am going to tell you about my school. There are 10 new desks and five old desks in it. One stove is in one corner. We have a football and have lots of fun playing football. We have two swings, one pair of trapeze. There are 14 children going to school. There are six boys.—Herbert Cone, Reardan, Wash.

FAY IS OLDEST OF FAMILY AND ONLY ONE IN SCHOOL

Dear Aunt Nellie: I am 9 years old and my birthday was September 5. Have I a twin? I have two sisters and their names are Doris and Lois, and besides them there is Homer. I am the oldest in the family and the only one that goes to school. I am in the fifth grade and there is one other in my class. There are eight pupils at school. My teacher's name is Miss Elida Smallwood. I have a mile and a half to walk to school. We have 60 horses and 60 head of cattle, 11 pigs and 70 chickens.—Fay Johnson, Quincy, Wash.

LOIS WRITES TO US FROM WAY UP IN THE MOUNTAINS

Dear Aunt Nellie: I live way up in the mountains. We have about a hundred chickens, and they are laying nicely now. We have three horses and one cow and a calf. We raised both of them from a little calf. I am in the third grade in school and there are three in my class. I have two brothers. One is 7 and one 3. We have some people working for us. My teacher was here for dinner Thanksgiving. Well I will close now for it is bed time.—Lois Manchester, Lyle, Wash.

MABEL WOULD LIKE TO HEAR FROM THE COUSINS

Dear Aunt Nellie: One of my school chums, Clara Olson, wrote to the Corner, so I thought I would write. We live on a farm and I have to walk nearly two miles to school. We have a big schoolroom with 43 pupils. Our teacher's name is Miss Lucy C. Smith. She is a very nice teacher and the girls love her very dearly. The principal's name is Mr. Simans. I would like to hear from some of the cousins very much.—Mabel Nicholson, Box 331, Bothell, Wash.

MINNIE ELLISON'S BEST PET IS HER BLACK CALF

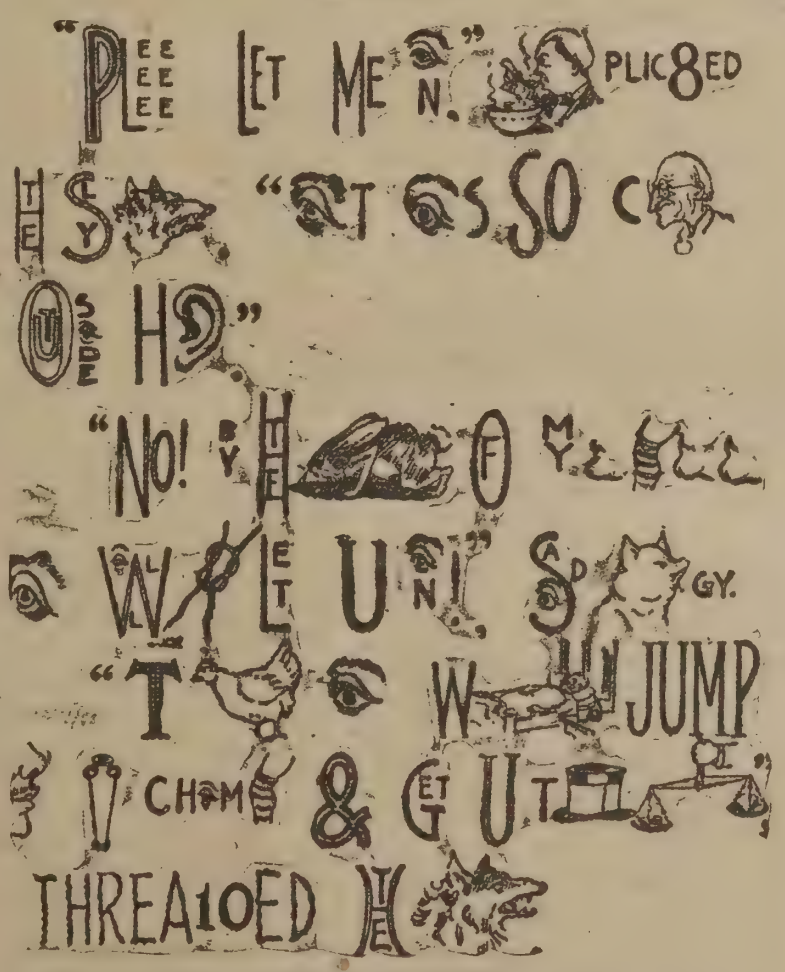
Dear Aunt Nellie: My papa takes The Farmer and I like to read the Children's Corner very much. I am 10 years old and am in the fourth grade. I have three brothers and no sisters. I have one of the cunningest little kittens. They play a while, then they eat and sleep. One is white and yellow, the other is white and yellow and gray. I have a dog named May. The best pet of all is my black calf and his name is Blackey.—Minnie Ellison, New Kamilche, Wash.

EMILY IS TRYING FOR A PRIZE IN SPELLING AT SCHOOL

Dear Aunt Nellie: I like to read the children's letters very much. I go to the Firwood school. I am 8 years old and in the second grade. My teacher's name is Mrs. Kerr and I like her very much. I am trying to win a prize in spelling this month and my sister won the prize last month in spelling. She got a thimble for her prize. I have four sisters and one brother.

EMILY SCHOENBAECHLER.
Box 84, Tacoma, Wash.

WE ARE GLAD TO HEAR FROM YOU—WRITE AGAIN, DOROTHY



Dear Aunt Nellie: I do not live on a farm, but we take The Farmer and will write to you any way. I am 9 years old. I am in the third grade and my teacher's name is Miss Gould. I take music lessons. I was born in Garfield, Wash., August 28. I have two brothers, whose names are Fred and Byron. My brother Avery is not living. I have one married sister, who has a little girl 1 year old.—Dorothy Genevieve Howard, Garfield, Wash.

EDITH WHITE TELLS US ABOUT HER MANY PETS

Dear Aunt Nellie: I will tell you about my pets. I have a puppy, two pigs, three calves, a horse and some cats. The puppy's name is Bab, the calves' names are Fairy, Topsy and Nancy. The horse's name is Dolly. I go to school and am in the fourth grade. My teacher's name is Miss Eva Hane. I have a brother and he is in the second grade. His teacher's name is Miss Mason.—Edith White, Curlew, Wash.

Story of the Three Little Pigs

CHAPTER XI.

Concluded next week.

SOLUTION TO LAST WEEK'S CHAPTER.

Instantly the wolf determined to devour the little pig, and started to conjure up in his brain some way to go about it.

"Nothing can keep me from it," he cried. "You are my meat!"

"Is that so?" responded the pugnacious, diminutive porker.

WHAT TIME IS IT?

What—no watch? Write to the Washington Farmer Circulation Department. We'll tell you how to earn one. Address the Washington Farmer, Room 37 Review building, Spokane, Wash.—Adv.

Grain and Produce Markets

Chicago Grain.

CHICAGO, Dec. 30.—Notable jumps in prices marked the close of the year in wheat trade. Speculators who at the last found themselves unable to make deliveries on December contracts bid the market up 7 cents a bushel in some cases. Signs of improved shipping conditions led to brisk advances, too, on more deferred deliveries. The close was nervous, 2 3-4 to 4 cents net higher with May at $1.74 1-4 to $1.74 1-2 and July at $1.41 1-8 to $1.48 1-4.

Corn gained 3-4 to 3c and oats 5-8 to 1 1-4@1 3-8c. Provisions finished unchanged to 25c higher.

Pacific Northwest Grain.

PORTLAND, Ore., Dec. 30.—Wheat—Strong, no trading. Spot bids unchanged to 2c higher. Bluestem, $1.53; fortyfold, $1.46; club, $1.42; red Russion, $1.40.

Barley unchanged.

TACOMA, Wash., Dec. 30.—Wheat—Bluestem, $1.50; fortyfold, $1.48; club and red fife, $1.43; red Russian, $1.38.

SEATTLE, Dec. 30.—Wheat—Bluestem, $1.51; turkey red, $1.53; fortyfold, $1.47; club, $1.47; fife, $1.47; red Russian, $1.25.

Barley—$37.25 per ton.

WILBUR, Wash., Dec. 30.—Bluestem, $1.35; club, $1.30. Oats, $33. Barley $33. No activity in the market.

WALLA WALLA, Wash., Dec. 30.—Club wheat, $1.32; bluestem, $1.38; barley, $38.

San Francisco Grain.

SAN FRANCISCO, Dec. 30.—Barley—May, $2.15 bid, $2.20 asked.

Minneapolis Grain.

MINNEAPOLIS, Dec. 30.—Continued export demand strengthened wheat prices. May closed 3c higher, and July finished 2 1-4c up. Corn and oats steady. Wheat receipts, 146 cars; compared with holiday a year ago.

Wheat—May opened $1.76 to $1.76 1-2; high, $1.80 1-8; low, $1.76; close, $1.79 1-8 to $1.79 3-8. July opened $1.69 1-2; high, $1.72 3-4; low, $1.69 1-2; closed, $1.72.

Cash—No. 1 hard, $1.80 1-4@1.85 1-4; No. 1 northern, $1.77 1-4@1.80 1-4; to arrive, $1.76 1-4@1.78 1-4; No. 2 northern, $1.73 1-4@1.79 1-4; No. 3 wheat, $1.64 1-4@1.75 1-4.

No. 1 durum, $1.73 7-8@1,87 7-8; No. 2 hard Montana, $1.73 1-4@1.75 1-4.

Corn—No. 3 yellow, 88@88 1-2c.

Oats—No. 3 white, 49 1-2@50c.

Flax—$2.82 3-4@2.86 3-4.

Flour—Fancy patents, 10c higher, quoted at $9.30. Other grades unchanged. Shipments, 43,749 barrels.

Barley—79c@$1.12.

Rye—$1.33@1.34.

Bran—$26@26.50.

Car Receipts at Coast Points.

Receipts of grain and hay in car lots at coast points for the fiscal year beginning July 1 up to Saturday night for 1916-17 and 1915-16 were as follows:

Seattle.	Wheat.	Oats.	Barley.	Hay.
1916-17	3479	732	240	2367
1915-16	6225	649	1050	2482
Portland.				
1916-17	3311	1310	111	1153
1915-16	8666	739	1221	1286
Total.				
1916-17	6790	2042	351	3500
1915-16	14891	1388	2271	3768

Seattle Market.

SEATTLE, Wash., Dec. 30.—The local ranch egg market has tightened perceptibly for the close of the week, with all dealers quoting 42c. There is considerable of a scarcity. Wholesalers report that they never before enjoyed so heavy a run of fresh ranch eggs to Alaska at this time of the year, and this is contributing to the unexpected shortage. Storage egg holdings are light at 32c, but jobbers expect that they will be cleaned up by January 15.

Butter is running "close to the churn." There is no surplus, and at the same time no outlook for an advance. Exporters are not active on this market, and it is thought that prices are too high for them to operate.

BUYING PRICES.

Unless otherwise stated the following prices are fixed, upon a jobbing basis and are average prices obtained in reports of transactions by jobbers.

The following prices are offered to the producer by the local dealers for delivery in round lots f. o. b. Seattle:

Eggs—Local, 36@38c per dozen.

Poultry—Live hens, fat, over 4 lbs., 17c per lb.; do, 3 lbs. and under, 12c; old roosters, 10c per lb.; springs, 17c per lb.; ducks, 71c per lb.; squabs, large, $3.50 per dozen; geese, fat, 12c lb.; turkeys, live, 24c.

Butterfat—42c lb.; dairy butter, 27c pound.

Beef—Buying price: Prime beef steers, 8c per lb.; cows, fat, 5@6c per pound.

Hogs—Light, 11 1-2@12c per lb.; do, heavy, 10@11c per lb.

Veal—Fancy light, 12 1-2@13c per lb.; do, heavy, 9@10c per lb.

Hides—Salted, 19@20c per lb.; salt kip, 24c per lb.; salted calf, 30@35c per lb.; green hides, 16@17c per lb.; salted bulls, 16c per lb.; dry hides (short trim), 32@33c per lb.; dry calf (under six lbs.), 38c per lb.; bull and dry salts, 4c per lb. less; green bulls, 13c per lb.; dry butcher full wool sheep pelts, 20@23c per lb.

Washington Crop Report.

A summary of estimates of November crop production and prices for the state of Washington, compiled by the bureau of crop estimates and transmitted through the weather bureau, United States department of agriculture, is as follows:

Corn—Acreage this year, 38,000; last year, 39,000; production this year, 1,406,000 bushels; last year, 1,053,000 bushels.

Winter wheat—Acreage this year, 690,000; last year, 1,300,00; production this year, 18,285,000 bushels; last year, 35,880,000 bushels.

Spring wheat—Acreage this year, 900,000; last year, 700,000; production this year, 19,350,000 bushels; last year, 15,540,000 bushels.

All wheat—Acreage this year, 1,590,000; last year, 2,000,000; production this year, 37,635,000 bushels; last year, 51,420,000 bushels.

Oats—Acreage this year, 275,000; last year, 275,000; production this year, 14,300,000 bushels; last year, 13,750,000 bushels.

Barley—Acreage this year, 165,000; last year, 175,000; production this year, 6,814,000 bushels; last year, 7,263,000 bushels.

Rye—Acreage this year, 7000; last year, 8000; production this year, 102,000 bushels; last year, 146,000 bushels.

Potatoes—Acreage this year, 60,000; last year, 61,000; production this year, 9,900,000 bushels; last year, 8,235,000 bushels.

Hay—Acreage this year, 836,000; last year, 812,000; production this year, 2,006,000 tons; last year, 1,868,000 tons.

Prices—The first price given below is the average on December 1 of this year, the second the average on December 1, last year: Corn, $1 and 77c per bushel. Winter wheat, all wheat and spring wheat, $1.43 and 82c per bushel. Oats, 51c and 37c per bushel. Barley, 84c and 56c per bushel. Rye, $1.11 and 75c per bushel. Potatoes, 98c and 53c per bushel. Hay, $13.80 and $10.80 per ton.

Seattle Wheat.

SEATTLE, Dec. 30.—There has been a brisk demand on the north coast this week for club wheat, a grade that was used principally for export when milling conditions were normal. Local mills are grinding heavily on this to fill orders for flour for export, but there has been a strong movement by rail to the Atlantic seaboard for shipment to the united kingdom. Millers have been both manufacturers of flour and exporters of grain. It is generally believed that considerable of this wheat was listed in the 4,000,000-bushel purchase during December for Europe. All purchases, however, have been made subject to delay by the car shortage.

Farmers are not selling. Only a few loads have changed hands during the week, and this in an indifferent way. Country bids have been $1.35 for bluestem, $1.37 for turkey red and $1.30 to $1.33 for fife. The beginning of the new year is expected to steady prices to some extent. Should the market again touch $1.50, as is expected, Washington farmers will begin selling at a heavy rate. This is the situation in the country as outlined by millers.

San Francisco Produce Market.

SAN FRANCISCO, Dec. 30.—Butter—Fresh extras, 35c; prime firsts, 34c; fresh firsts, 33c.

Eggs—Fresh extras, 38½c; pullets, 32c.

Cheese—New, 17c; California fancy, 16½c; Young Americas, 21c.

Poultry—Hens, 19@20c; old roosters, 11@12c; fryers, 22@23c; broilers, 27@30c; large 22@23c; squabs, $2@2.50; pigeons, $1.25@1.75; ducks, 13@14c; geese, 15@17c; turkeys, 20@21c.

Vegetables—Lettuce, 75c@$1.00 per crate; fancy, $1.35@1.50; peas, southern, fancy, large, 10@11c; summer squash, 85c@$1 crate; cream squash, 85c@$1.25 box; tomatoes, southern, $1.50@1.75; fancy, $2; eggplant, 7@10c; green peppers, 10@15c; fancy small, 3@8c; garlic, 4@6c; celery, $3.25@3.50 crate; rhubarb, $1@1.25; marrowfat and hubbard squash, 85c@$1.

Potatoes—River, $2@2.25; sweet potatoes, $2.75.

Prussian Insane Asylum.

By allowing its occupants practical freedom and employing them at useful occupations a Prussian insane asylum effects about 20 per cent of cures annually.

Life Stock Quotations.

At Chicago.

CHICAGO, Dec. 30.—Hogs—Receipts, 21,000; slow, 5c to 10c under yesterday's average. Bulk, $10.05@10.40; light, $9.55@10.20; mixed, $9.90@10.50; heavy, $10@10.50; rough, $10@10.15; pigs, $7.50@9.20.

Cattle—Receipts, 400; steady. Native beef cattle, $7.25@11.80; western steers, $7.25@10; stockers and feeders, $5.25@8.25; cows and heifers, $4.25@10; calves, $9@13.

Sheep—Receipts, 3000; steady. Wethers, $9.10@10.25; lambs, $11.25@13.50.

At Omaha.

OMAHA, Neb., Dec. 30.—Hogs—Receipts, 8300; lower. Heavy, $9.90@10.25; light, $9.50@10.10; pigs, $7.75@9.25; bulk of sales, $5.65@10.

Cattle—Receipts, 200; steady. Native steers, $7.50@11.50; cows and heifers; $6@8.50; western steers, $6.50@9.25; Texas steers, $6@7.50; stockers and feeders, $6@8.30.

Sheep—Receipts, 100; steady. Yearlings, $9.25@11.25; wethers, $8.50@11; lambs, $12.10@13.25.

At St. Paul.

SOUTH ST. PAUL, Minn., Dec. 30.—Estimated receipts at the Union Stock Yards today: Cattle, 275; calves, 25; hogs, 1700; sheep, 100; cars 31.

Cattle—New records in receipts were established today when the local market closed for the year. Today's small run put the year's receipts of cattle at, approximately, 756,800, and calves at 184,400, exceeding all previous years.

Hogs—Ten cents was cut off the price lists in the hog market today, when a light run was estimated. The sag put top hogs at $9.90 and bulk between $9.80 and $9.85. The downward tendency of the past two days has removed considerable of the bloom which the trade enjoyed during the week and right now prices are 10c to 15c above the close a week ago.

Sheep—Hardly enough stuff to afford a line on the market was in the section today, the few bunches which were cashed reflected no change in the situation, which has remained the same as at the close a week ago all during the week. Prices being paid at the close of the year are higher than ever before and prospects are that these rates will be held in force for some time.

At Portland.

PORTLAND, Dec. 30.—Hogs—Steady; receipts, 137. Bulk of packing grades, $9.75@9.85; heavy packing, $9.85@9.95; heavy butchers, $9.85@9.95; light packing, $9.70@9.80; rough heavies, $8.50@9; pigs and skips, $8@8.50; stock hogs, $6.50@8.25; cripples, $8.

Cattle—Steady; receipts, 90. Steers, prime light, $8@8.25; prime heavy, $8@8.25; good, $7.50@7.85; cows, choice, $6.50@6.75; medium to good, $6@6.25; ordinary to fair, $5.25@5.75; heifers, $6.25@7; bulls, $3.50@5; calves, $5@7.

Sheep—Steady; receipts, 18. Lambs, east of mountains, no offers. Lambs, valley, $10@10.50; lambs, common, $9@9.50; choice yearling wethers, $8.50@9; good yearlings, $8@8.50; choice light ewes, $7.25@7.75; heavy ewes, $6.75@7.25.

At Seattle.

SEATTLE, Dec. 30.—Receipts, 373 hogs, 92 cattle.

Cattle—Higher. Prime steers, $8.25; medium to choice, $7@7.25; common, $5.50@6.75; best cows and heifers, $6.75@7; medium to choice, $5.50@5.75; common bulls, $3.50@4; calves, $7@8.50.

Hogs—Prime light, $9.95@10; medium to choice, $9.50@9.80; smooth heavies, $9.15@9.50; rough heavies, $8.65@9; pigs, $8.25@9.

Sheep—Prime lambs, $8.50@9; yearlings, $7@7.70; wethers, $6.50@7; ewes, $6@6.50.

Spokane Union Stockyards.

Cattle—No receipts; market strong for good butcher grades. Prime light steers, $7.25@7.75; prime heavy steers, $7.25@8; good streers, $6.50@7; feeders, $5.25@6; prime cows, $5.75@6.25; good cows, $5.25@5.65; prime heifers, $6@6.50; bulls $3.50@4.75; calves, $5.75@6.75.

Hogs—Market strong on prime butcher and packer grades. Prime light, $9.60@9.80; prime heavy, $9.50@9.75; good light, $9.50@9.75; rough heavy, $8.50@9; stockers, $6.50@7.50.

Sheep—No receipts, market strong. Prime lambs, $9.25@9.75; common lambs, $8@8.75; choice yearlings, $7.50@8.25; good yearlings, $7.25@7.50; choice ewes, $6.25@7.25.

Wool.

BOSTON, Dec. 29.—The Commercial Bulletin will say tomorrow:

"This week has been comparatively quiet in the wool markets, and while the upward trend of prices has stopped the market is nevertheless firm. Manufacturers have taken some wool at full rates, but a considerable proportion of the week's trade appears to have been confined to dealers.

"Manufacturers are busy on old contracts and stock taking, and new business seems to have been rather light in the west. Contracting goes on slowly at full recent prices."

Wool, scoured basis:

Texas fine, 12 months, 95@$1.00; fine 8 months, 85@88c.

California northern, 85@90c; middle county, 80@82c; southern, 68@70c.

Oregon eastern, No. 1 staple, $1@1.05; eastern clothing, 94@95c; valley, No. 1, 90@92c.

Territory fine staple, $1.10@1.12; half-blood combing, $1@1.05; blood combing, 90@92c; fine clothing, 90@92c; fine medium clothing, 85@87c.

Spokane Market.

The wholesale prices quoted in the list below are not the prices paid to producers or shippers; they are those charged by the Spokane commission houses to the retail trade for standard produce. The prices quoted for live stock, however, are the prices given to the producer.

Potatoes—Potatoes, $2@2.20 cwt; new potatoes, 15c lb; sweet potatoes, $3.

Apples—Washington apples, cooking, 60c@85c; eating, $1@1.25; Wageners, $1.25@1.35 box; Jonathans, $1.25@1.35 box; Winter Bananas, 80c box; Kings, $1 box; Spitzenburgs, $2 box; Baldwins, 90c box; Delicious, large, $1.75@2.25 box; Rome Beauties, $1.25 box; Winesaps, $1.75@2 box; Y. N. Pippins, $1.75@2 box.

Butter—Blanchard cartons, 40c lb; Medo-Maid, 40c lb; Cascade, 40c lb; Gold Coin, 36c lb; Gold Leaf, 40c lb; Better butter, 40c lb; Hazelwood, 40c lb; Peerless, 38c lb; Jersey Belle, 39c lb; Attalia, 40c lb; Diadem, 40c lb; Jersey, 38c lb.

Cheese—Wisconsin full cream, twins, 23c; triplets, 28½c; Wisconsin limburger, 28c lb; brick cheese, 28c lb; domestic Swiss, 30c lb; western cream, Idaho or Oregon twin or triplets, 24c lb; Young Americas, 22c lb.

Eggs—Fresh local ranch eggs, $13@14; fresh eastern eggs, $13 case; eastern storage eggs, $10@10.50; white fillers, $11 a case.

Cattle—Prime steers, $7@7.50 cwt; heifers, $6.50@7; cows, $5.50@6.

Sheep—Wethers, $9@9.50 cwt; ewes, $8@8.50 cwt; lambs, $10@11 cwt.

Hogs—Heavy hogs, $9 cwt; light hogs, $9.50@10.

Live Poultry—Springs, 12@13c lb; hens, 12@13c lb; old roosters, 6@7c lb; young ducks, 11@13c lb; geese, 10c lb; turkeys, 20@25c.

Portland Market.

PORTLAND, Ore., Dec. 30.—There was still some inquiry from the east yesterday for milling bluestem, but in a general way the demand flattened out in consequence of the reversal in the speculative markets. With the falling off in eastern interest, buying operations in the northwest, which for several days had been moderately active, came to a stop.

At the Merchants' Exchange prices were allowed to sag, bids for bluestem being 1 cent under those of Thursday, and for fortyfold 2 cents less. Club offers were unchanged and red wheat was 1 cent lower. Oats bids were scaled down a quarter.

Butter—Cubes, extras, 35c; prime firsts, 34c; firsts, 33c. Jobbing prices: Prime extras, 37@38c; cartons, 1c extra; butterfat, No. 1, 38c; No. 2, 36c, Portland.

Cheese—Jobbers' buying price, f. o. b. dock, Portland: Tillamook triplets, 20c; Young Americas, not quoted.

Eggs—Oregon ranch, current receipts, 40c per dozen; Oregon ranch, candled, 43c per dozen; Oregon ranch, selects, 45c.

Poultry—Hens, 14@17c; springs, 16c per pound; turkeys, live, 23@25c; dressed, 30@31c; ducks, 15@16c; geese, 12 1-2c.

Portland Wheat.

PORTLAND, Ore., Dec. 30.—The wheat market in the closing week of the year was on a firm basis. There was a good demand from the east and south most of the time and the knowledge that stocks in the country were light caused dealers to bid up in order to get supplies. Farmers, however, were not disposed to let go freely at any time. Closing bids for January wheat at the merchants 'exchange were: Bluestem, $1.53; fortyfold, $1.46; club, $1.42; red Russian, $1.40.

Statistics compiled by the merchants' exchange show the following local receipts in the last year: Wheat, 6,871,800 bushels; barley, 15,540 tons; oats, 43,600 tons; flour, 673,600 barrels; hay, 30,720 tons.

LARGER ACREAGE
Give Project Figures for 1917.

The productive acreage of the Yakima valley under government project will be increased by 800 acres next crop season, according to data furnished by the project managers, who say it may be raised to 10,000 under favorable conditions. Superintendent L. M. Holt of the Indian reclamation service expects to furnish water for 3000 additional acres and Manager R. K. Tiffany of the Yakima project looks for an increase of 5000.

Community Club Organized.

The Hood View Community club has just been organized for the purpose of fostering the interests of the district lying between the town of White Salmon, Wash., and the White Salmon river; also to cooperate in effort for the welfare of the White Salmon valley. The officers are: Elwood Peck, president; Floyd Martin, vice president; J. E. Cox, secretary and treasurer. A road committee composed of C. W. J. Reckers, Elwood Peck and F. O. Childs was appointed. The matter of building a community packing house was discussed and a committee appointed to investigate the matter and make a report at an early date.

Commercial Age

Are We Over "Commercialized"?

The Farmer is constantly receiving interesting expressions of personal opinions from its readers which it is glad to pass on to others. Below is one such interesting article.

If it were not far the commercialized system of doing things today we might get better results from our products. The fruit business is commercialized to death and the daily menu of even the farmer class is minus fruit. We sell our wheat and buy flour, or more properly, bread. We sell our beef to the drover and pay 25 cents per pound for our beefsteak, and we sell hogs to men who are laying up money by traveling over the country buying and selling such things, and the spareribs, pigs feet, and sausage of long ago do not enter into the daily bill of fare. We sell our milk to buy butter and sell wool to the highest bidder at the wool sale and go with cold feet the next winter in thin cotton socks, in fact, we sell everything we raise in its cheapest form and buy it back after a half dozen men have made a living off our labor and then put our whole set of officers at Washington, from President Wilson down, on the job, hunting up the cause of the high cost of living. We ride in our automobiles and let the taxes go delinquent. We are a great people and live in a great age. We are too busy to go with the wife to visit our next door neighbor and be sociable. A. P. CLARK.
Madras, Ore.

Pest Parasite Wanted.

George H. Hecke, California state commissioner of horticulture, announced today he would accept an offer made by men engaged in the beet sugar inquiry in California to contribute $2000 toward sending an expedition to Australia in search for a parasite needed to combat the beet leaf hopper. This pest is believed to have done $1,000,000 worth of damage to the state's sugar beet crop this year.

NEWS FOR BREEDERS

Two Duroc Jersey Prize Winners

Pacific Queen 2d and Pacific Queen 3d, two Duroc Jersey sows which won first and second at the Oregon State fair, 1916. They were 14 months old and showed and won against 18-months-old hogs. They are bred and owned by Doerfler Brothers of Silverton, Ore.

STOCK RAISING IN THE SOUTH.

Experiments by the department, in cooperation with the state experiment stations, have shown conclusively that the south is well adapted to economical beef and pork production, says Secretary of Agriculture D. F. Houston, in his annual report just submitted to the president. It is beginning to take its place with other sections as a stock raising territory. Numerous breeding herds are being established. The leading beef cattle breeders' associations are featuring the southern trade, and two of them are holding sales in cooperation with the department. Cattle from southern herds have won the highest honors in northern show rings, and steers from southern feed lots, after being properly fattened, now command good prices in northern markets. This work is not for the benefit of one section alone; the entire country will profit from the extension of meat production into new territory.

PEARL'S FERN RIDGE KING.

Guernseys are gaining in favor among the dairymen west of the Cascades and every year sees a few important additions to the purebred herds in that section.

The herd of A. J. Sinnes of Mount Vernoon, while not large in numbers, carries some of the best blood in the west and Mr. Sinnes has recently added to his herd one of the best Guernsey bull is tne west—Pearl's Fern Ridge King, shown above, purchased from A. L. Giles' Chicona farm herd at Chinook, Wash. This bull has made a remarkable record on the western show circuit and at the head of the Sinnes herd should give a good record of himself as a sire.

CUBANS BUY FINE STOCK.

Rudolph Rojas, who owns an extensive cattle ranch; Thomas Towns, a progressive planter and stockman, and R. F. Kendall, manager of the Rolando Fruit company, all of Holquin, Cuba, have been in Lexington, Ky., and have made the following purchases of the Cook farms: Mr. Rojas bought a few head of fine sheep, the 4-year-old saddle stallion, MacDonald Boy No. 5882, by MacDonald Chief, No. 1451, dam King's Girl, by King, and the 3-year-old gelding, Beauty Boy, by Dandy Jim II., dam Black Beauty II., and three other Cuban gaited geldings; Mr. Towns bought the 2-year-old registered Percheron stallion, Major, and a pair of fancy 2-year-old mules. Mr. Kendall bought the 2-year-old registered jack, Kentucky Colonel, and 35 yearling mules and 15 2-year-old mules. These young mules are the first that have been shipped out of Kentucky to Cuba. The animals in this shipment cost about $10,000. These gentlemen are extensive planters and stockmen of Oriente province.

IMPORTANT AYRSHIRE SALE.

An important sale in the annals of the Ayrshire breed was conducted at Vargenoc, Drongan, Ayrshire, when the bull calves from John Logan's herd of Ayrshire cattle were disposed of recently, according to the London Live Stock Journal. Bidding was of a sensational nature at times, resulting in a fine price of 380 guineas, or about $1900, being obtained, while 17 bulls averaged about $455.

Bargenoch Bright Star, the bull which made $1900, is a thick, stylish son of Magnificent, and his dam has a record of 915 gallons at 3.91 per cent butterfat in 29 weeks. He was knocked down to Mr. Mair, Carston, Ochiltree. This figure constittues a record for the breed at an auction sale, the previous best being $850 at Lanark in 1915 for a young bull, and $1000 for an old bull at Lochfergus sale in 1913.

HOLSTEINS IN ARIZONA.

A shipment of 350 grade Holstein cattle has just been made from Mount Vernon, Wash., to Phoenix, Ariz. These will be distributed among the dairymen of that section.

C. T. Hirst, the Arizona man who is responsible for this shipment, himself owns a large ranch and declares that the Salt river valley now has 225,000 acres of land under cultivation, all watered by the Roosevelt dam project.

COW TESTING ASSOCIATIONS.

Cow testing associations have been organized under the direction of C. Farr, county agriculturist of Snohomish county at Stanwood and Arlington. Will H. Henry, Ellensburg, a state college graduate, has been appointed tester in charge of the Stanwood association and Bryan Jordal, of Waikiki Farms, Spokane, will go to the Arlington association.

AT FARMERS' SALE.

Over 30 head of cattle were sold at the second farmers' public sale at Puyallup, Wash. The highest brought $127, another $100 and a third $97, while several sold for over $80. Six head of pigs sold for over $34. The sale is reported a success in every particular.

RESERVE JUNIOR CHAMPION.

The above is a photo of Topsy 4th, the Shorthorn senior heifer calf that won first prize in her class and was made reserve junior champion at the Pacific International Live Stock show. Topsy has a sweet feminine head, as the picture shows, a very straight top, broad back and rump, a good front, popular color and is in every way a very superior specimen of the Shorthorn breed. She is owned by Day & Rothrock of Sprague, Wash., who exhibited a small herd of young stock at the above-mentioned show.

Paid $500 for Calf.

Dwight A. Smith of Tendoy, Idaho, is a believer in milking Shorthorns. He attended the Milking Shorthorn association at St. Paul last fall and was reelected director for a term of three years. While there he bought from the Otis herd a dark roan calf which cost $500. The calf is out of Fairholm Red Rose 38th, got by Jeweler 378128. Jemeles is considered by Mr. Otis as his best show bull. He was first senior yearling and grand champion bull at New York State fair in 1913. Last year he took first prize and championship honors at four state fairs.

Fairholk Red Rose 38th 16332 has a record of 10,225 pounds, was first in her class for cows in milk at the 1910 International.

Value of Show

Impresses State College Expert

To the Editor of the Washington Farmer: The Pacific International exposition in Portland, Ore., may be correctly heralded as the best assemblage of live stock ever seen in the Pacific northwest. The coveted blue, red and purple ribbons were hard to win because of the strong competition. The tops in each class were superlative in form, quality and condition. To win a premium in such company is a feat worthy of the mettle of our best breeders.

The animal husbandry division of agriculture at the State College of Washington won the following list of awards in open competition:

Champion Clydesdale mare on "Colony Nancy;" champion Percheron mare on "Black Beauty;" champion grade steer on the Shorthorn "Silver King;" champion Hampshire ewe on "Eldora;" 1st prize Hereford-Galloway calf on "Alaska Maid;" 1st prize grade steer herd of three animals; 2nd prize grade steer on the Shorthorn "Hercules Hero;" 2nd prize Shorthorn senior bull calf on "Village Excelsior;" 3rd prize Shorthorn senior yearling heifer on "Maxwalton Foxglove 5th;" 5th prize Hereford 2-year-old Hereford heifer on "Discretion's Verona;" 1st prize Clydesdale stallion on "Imperial Guest;" 3rd prize Shropshire ewe on "Carlton;" 3rd prize pen of three yearling wethers; 4th prize on Hereford steer calf "Sweetwater Pride."

The fat steers and wethers were sold for Christmas beef to leading Portland hotels patronized by stockmen. "Hercules Hero," weight 1320 pounds, sold for $25.50 per 100 pounds. He was bought by the Portland hotel for a total of $346.80. "Silver King," weight 1520 pounds, brought $14.50 per 100 pounds on the hoof. "Sweetwater Pride," weight 900 pounds, brought $15 per 100 pounds or a total of $144 on foot. Three yearling wethers sold for $13.75 per 100 pounds and fetched $82.50.

To any one not directly in touch with the fitting and management of a herd, flock or stud of exhibition stock it must be said that much of the credit for the winnings should go to the herdsmen who prepare the beasts for the showing. Alex McAllister, who is horseman at the college, and Richard Hanna, beef and sheep herdsman, deserve the greater part of the honor for their consistent and careful work.

WILLIAM HISLOP,
Professor of animal husbandry, State College of Washington.

PENRITH SHORTHORN BREEDERS.

Presiding at the annual meeting of the Penrith Association of Shorthorn Breeders, E. O. Bolton said the association had had a remarkably successful year, while at their three sales unprecedented prices were realized. The top-price bull was sold for $4750, while the average rose from $165 last year to $220. They had an entry of 565 animals and 491 were sold, while in every section and at all three sales the demand for the best Cumberland and Westmoriand bred Shorthorns proved that these animals had gained a popularity in all parts of the country, which they well merited. J. H. Toppin was elected president for the year and John Handley vice president.

Rancher Heads Church.

D. B. Eby, a rancher of the Sunnyside vicinity, has accepted the call to become pastor of an Olympia church.

Fattening Hogs

Question of Feeding Alfalfa

By E. L. Potter.

The question has arisen as to whether hogs should be allowed access to alfalfa during the fattening period. The value of alfalfa during the growing period is admitted by all, but a few are inclined to believe that during the final fattening the hogs will do better if confined in a dry lot and fed only grain. In answer to this the eastern Oregon experiment station has conducted several tests and their results have been very emphatically in favor of the use of alfalfa pasture in fattening, but in connection with the self feeders. In all of the experimental work that has been carried on by both the Corvallis and the eastern Oregon stations the lowest feed cost in fattening has been obtained at the eastern Oregon station an barley in a self feeder in connection with good alfalfa pasture. If dry lot fattening is for any reason necessary the grain must be supplemented with skim milk, tankage or something of that nature.

Alfalfa hay for fattening has much less value than the pasture, but even then it helps providing the hogs are given all the grain they wish and are not forced to eat more alfalfa hay than they really wish. They will eat but a very little of the hay, but that little will help materially. Cut or ground alfalfa will go further than the long hay on account of less waste, but the gain will be no greater. Mixing cut hay with grain is not desirable for fattening purposes since it tends to lessen the amount of grain eaten although for this very reason it may be just the thing for growing pigs or brood sows. A good supplement for grain for fattening pigs must increase rather than decrease the amount of grain consumed.

Study Live Stock.

Beginning with the school year last fall, a class of 22 boys in the Colville high school in Stevens county spent two hours every afternoon (when the weather permitted) of the first month of school judging dairy cattle, horses, swine, sheep and beef cattle and in becoming acquainted in general with different breeds of live stock. To do this trips were made to neighboring farms and the farmers themselves proved only too glad to do what they could for the high school boys. Class work was not begun in the school room until after the Stevens County Live Stock show.

A study of the horse has been made, the discussion covering description, history and importance of the draft breeds, Clydesdale, Percheron, Shire and Belgian; also of the light horses, as the thoroughbred, standard bred, German and French coach and American saddler and trotter; the care of the horse, unsoundness, as splints, spavins, etc., effects of poor conformation, care of teeth, etc.; feeding of horses, computing simple rations, value of local feeds and kindred matters.

Would Compel Threshermen to Do Better Work

Wheat Convention Instructs Committee to Frame Standardization Law

By FRED W. CLEMENS

The convention of the Washington State Grain Growers, Shippers and Millers association held at Pullman last week almost exceeded the speed of the last night of a legislative session at Olympia, when the matter of the need of cleaner grain came up. Richard I. Stephens of the Stephens-Smith Grain company of Spokane had just finished his address on the subject, in which he talked of the law in effect in Canada requiring threshermen to clean grain in accordance with a specified standard.

C. B. Kegley arose and suggested that this state should have some such law, and that the convention should appoint a committee to prepare it for presentation to the present state legislature. President Rogers said a motion to that effect would be proper if such a move were desired. Mr. Kegley made the motion, including the provision that the president, Mr. Rogers, should be chairman of the committee, which he also should appoint. The motion was seconded.

Like a judge disqualified because of personal interest in a case, President Rogers hesitated. Mr. Kegley assumed control. "You have heard the motion, gentlemen. Those in favor say aye." A few voices voted aye. "Those opposed say no." There were no noes. "The motion is carried."

With almost no discussion the convention had authorized a committee of its members to prepare and ask the legislature to adopt a law regulating a vital phase of the grain-growing industry.

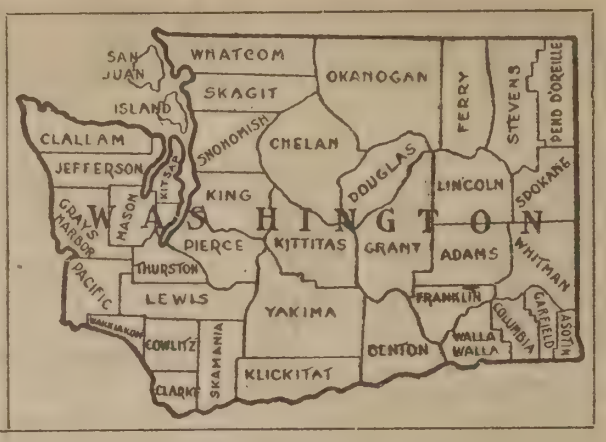
Clean or Dirty Wheat.

Mr. Stephens treated the subject, "Clean Versus Dirty Wheat," instructively and entertainingly. He said that threshermen were responsible for unclean wheat, and recommended that a cleaner and a smutter be attached to every thresher. This should be done not alone to take the weed seed, cracked grain, smut balls, cobs and the like out of the wheat to give it a higher grade and prevent dockage, but to permit of the weed seed and the smut being destroyed as a part of the campaign against these two pests. He also cited figures to show that large amounts of money were paid out annually in freight on foreign matter in the wheat shipped, thus producing a double loss to the grower. He said also that much of the cleanings were valuable if kept on the farm for hog feed, though useless if taken out after the grain had been shipped away. He advocated a standardization of grain from the standpoint of its freedom from foreign matter.

Mutual Problems Discussed.

Four elements that in the not very distant past have manifested at times considerable antagonism toward each other, sometimes to the extent of bickerings, misunderstandings, and even enmities, met in this, the eleventh annual grain convention, and discussed together their mutual problems. They were the wheat farmer, the grain market man, the railroad man and the miller. It is not improbable that next year's convention will see a fifth, the baker, present, a suggestion to that effect having been agreeably received by last week's convention.

A remarkable spirit of harmony prevailed, but not to the extent that the four factors in the production of bread fully agreed the one with the other on all the issues involved. The harmony was most manifest in the willingness of practically all those present to admit that there were two sides to most questions, and to listen to the presentation of the other fellow's view.



The only noticeable exception to this rule was the attack made by C. B. Kegley, master of the state grange, and L. C. Crow,

(Continued on page three.)

The committee that will draw up the measure for presentation to the legislature was chosen as follows: A. L. Rogers, chairman in accordance with the motion passed; R. J. Stephens of Spokane, and Ira D. Cardiff of Pullman.

Railroad Improves Business

Railroads and Automobiles a Big Factor in the Upbuilding of Community Life Both Financially and From a Social Point of View.

Clallam County, Wash.—New railroad built into the county has added an impetus to farming operations and dairying. A new irrigation project promises to prove profitable.

Lewis County, Wash.—The automobile is one of the most potent social factors in the rural districts, enabling farmers and their families to make more frequent visits and attend meetings more generally.

Whitman County, Wash.—"This section has had, without a doubt, the most prosperous year in its history."

Railroad Improves Business.

PORT ANGELES, Clallam County, Wash., Dec. 27.—There has been a general impetus in farming since the advent of the railroad into Clallam county two years ago and, while the increase in grain products has been small, I should think that the increase in dairy products has been from 15 to 20 per cent. There are many signs of new clearings, houses and barns going up and in the eastern part of the county a new irrigation project is under foot, the Happy Valley Irrigation project, which will add to our intrinsic wealth. At present we have a cold spell, but there is no danger of damage to grain or crops.

J. P. CHRISTENSEN.

A Social Factor.

CHEHALIS, Lewis County, Wash., Dec. 30.—This community is increasing its production of dairy products and Holstein cattle. The roads in this county are noticeably improving, hence more automobiles, which makes for sociability, more visiting from farm to farm, and greater interest in farmers' schools, grange and public gatherings for the betterment of the community. There is a steady increase in the building of modern houses in the country and of good barns and silos. The fall grain has not been damaged by the cold and the prospects for grain are favorable. J. C. BUSH.

A Prosperous Year.

LA CROSSE, Whitman County, Wash., Jan. 1.—While wheat is the main crop raised here many farmers are improving their herds of live stock by getting the best breeding stock that money can buy. This section has had, without a doubt, the most prosperous year in its existence. The rainfall for 1916 was above normal and helped to produce the biggest crop ever harvested here. Winter wheat prospects hardly more than 50 per cent of the acreage seeded in the fall on account of the dryness, and the germination was poor, so very few fields had a good stand. Consequently most of the farmers are planning to reseed in the spring. Stock is wintering in good condition. Not more than five per cent of the usual plowing was done this fall. M. E. SCHRECK.

Library Is Maintained.

HUNTERS, Stevens County, Wash., Dec. 28.—The cold weather in November was the cause of some loss by freezing of apples not yet picked. A good many farmers who did not have strawstacks or stubble fields for their cattle to run in had to begin feeding early. Some did not need to start feeding hay until the first week in December. The weather in December has been only moderately cold and stock is therefore doing well. There was some fall plowing done early in November, as the ground was then getting into fair condition for plowing, due to rain, but the cold snap stopped this work. The work on the farms in winter consists chiefly of caring for the stock. Those located in the timber engage to some extent in cutting wood on their own places or in delivering wood in town, where the demand is good at $2 per rick. Wood is not particularly plentiful. Both spring and fall pigs are being raised here. The spring pigs are turned off when about nine months old, while the fall pigs, as a rule, must be kept nearly twelve months. There is a divergence of opinion among farmers as to which are the more profitable, though it would seem that the spring pigs should be. There are a number of clubs in this community which, though not social in purpose, yet afford sociability. Among these are the Mothers' club and the Dorcas society. The latter organization maintains a library at Hunters, the expenses of which are taken care of by the charging of a small fee for the use of books. Other organizations are a fair association, commercial club, brass band and an orchestra.

ELIAS NELSON.

Ship Live Stock.

PROSSER, Benton County, Wash., Dec. 27.—The cold weather caught some of the farmers with their potatoes in the ground. Stock did not suffer any, as most of the stock is on the range. Fall work was handicapped some, as the farmers did not get all their plowing done. Fuel is plentiful, but much higher in price than last year. Spring pigs are raised here, as it costs too much to winter fall pigs. The farmers dress their own hogs for home consumption. There have been five cars of hogs and two cars of mixed stock shipped from Prosser in the last eight weeks. The Grange is the only community organization here.

G. W. WILGUS.

Working for Grange Hall.

MALAGA, Chelan County, Wash., Dec. 28.—This community was pretty well prepared for the cold weather and the stock are looking well for this time of the year. Fall work was handicapped by lack of help. Some apples were lost by the early frost. Fuel is plentiful here. The winter work consists of feeding stock, pruning orchards and hauling hay to market. Most of the farmers raise spring pigs and sell on foot. We are working very hard to get a grange hall, as our grange is the only community organization here. MRS. O. ALLENBAUGH.

Marketing Union Is Aid.

KENNEWICK, Benton County, Wash., Dec. 28.—Stock has not suffered particularly from the recent cold weather. Fall work in the wheat section was decidedly handicapped because of no rainfall. Many of the orchardists are now busy pruning their trees. Nearly all of the hog raisers in this section produce two crops of pigs in a year. The spring pigs are more profitable in practically all cases. Most of the hogs are sold on foot. Practically every community in the county has a local farmers' organization. In most all communities it is a local grange. These organizations are active and especially well attended in the fall and winter. Some of them have literary and musical entertainments. Nearly all of them have a number of discussions during the winter on practical farm problems. The Kennewick-Richland Marketing Union, which marketed 95 per cent of this year's strawberry crop, has its plans well under way for the marketing of the 1917 crop of strawberries, asparagus and early potatoes. A large per cent of those crops are now signed up with the cooperative association. LEE M. LAMPSON.

Are More Silos.

CASTLE ROCK, Cowlitz County, Wash., Dec. 29.—The ground is covered with snow, for the first time this season. As a rule the farmers were nicely prepared for the cold snap and snow storm. The stock was in from the range, the buildings were filled with hay and grain, and the silo feed had been well preserved and is opening up fine. There are many silos in this county, which is one of the noticeable improvements on the farms here. New farm buildings are also going up and the old ones are being repaired, which shows that some progress is being made. The potato crop was good in this section. Thirty carloads of potatoes have been shipped, some to eastern points, but most of them to California, and I am told that at least 15 carloads are being held for the spring market. Compared with last year there has been an increase in this product. Grain was about the same with the exception of wheat. It has been demonstrated that we can not raise wheat on our high-proiced land to compete with the eastern Washington grower. Most of the grain was put in the ground in the spring, so did not suffer from fall rains and sleet. Prospects for the new year are good.

C. C. BROWN.

Are After Grain Money.

LITTLE ROCK, Thurston County, Wash., Dec. 29.—This community is trying to increase the production of nearly everything, but on account of high grain that seems to be the leading thing they are trying to produce. There has been too great a demand for grain to bother very much in increasing the live stock. The main improvement is clearing the land. Some building of houses, barns and silos is noticeable but mostly silos. So far no damage has been noticed to the fall grain from cold weather, but it is early yet for a prediction of the next crop.

LEE KEGLEY.

Want a Meeting Place.

RAINIER, Thurston County, Wash., Jan. 2.—This community is increasing its production in dairy products and the raising of more cows and hay. The farmers must keep stock to keep up the fertility of the land. The one big improvement made here in recent years is the good roads, and what we now lack for the community is a good hall for community gatherings. A grange has been organized here recently. The prospects in grain for next year are not very bright, as the fall was too dry, so very little could be sown. Stock is wintering very well so far.

L. F. DAVIS.

Raise No Pigs.

FINLEY, Benton County, Wash., Jan. 1.—On account of the late freeze farm work has been postponed for a couple of weeks. Fuel has been a little scarce, but at present is plentiful and is higher in price than last year. There is the regular farm work being done during the winter. Some are pruning and making cement pipe for irrigating in the spring. We raise no pigs in this vicinity. We have a good, live grange organization and a parent-teacher organization here. F. A. SMITH.

Teachers Form Club.

BURLEY, Cassia County, Idaho, Dec. 12.—This community was not prepared for the recent cold weather, so the stock suffered considerably and the fall work was handicapped. A large acreage of sugar beets were frozen in the ground as well as many potatoes. At this date some are hauling beets, that is, the growers who were fortunate enough to get them out during the recent mild weather, and have since topped them. The farmers are kept busy feeding hogs, sheep and dairy stock, through the winter. Mostly spring pigs are grown here. Very few hogs are dressed by the farmer for market. There has been no social life in this community aside from the various church and lodge organizations. The teachers of the public school are, however, beginning to organize clubs and we think before long we will have live, progressive community organizations here. VICTOR SMITH.

Fall Pigs Profitable.

SHEDDS, Linn County, Ore., Dec. 30.—The cold weather did no harm and the stock did not suffer much. The fall work was well done. Fuel is plentiful and reasonable. We raise both spring and fall pigs and fall pigs seem to be the most profitable on account of the green feed. They sell mostly on foot. The Grange is the only organization we have. J. B. CORNETT.

IT TAKES 400,000 cars to carry American Fertilizers to Farmers and Planters every season. Forty per cent. of this is useless Filler requiring 160,000 cars! Insist on having less Filler and all high grades with Available Nitrogen, namely:

Nitrate of Soda

and thus cut freight bills.

Crop production from such Fertilizers means greater outbound tonnage for roads and bigger purchasing power for Farmers. Railroads and everybody would benefit.

Larger food crops thus grown would give increased prosperity to all. It is up to you, Mr. Farmer.

Would Require Cleaner Threshing

Wheat Convention Authorizes Committee to Frame Standardization Law

(Continued from page one.)

former president of the farmers' union, upon the Minneapolis Chamber of Commerce, which is the Minneapolis grain exchange, and which was represented at the convention by its secretary, John G. McHugh. The latter explained the exchange as a necessary feature of the grain business, conducted privately, vitally essential to the grain grower and wholly friendly toward him.

Master Kegley and former President Crow challenged the assertions of Mr. McHugh, declaring the Minneapolis exchange to be a monopolistic organization through which the grain growers of Minneapolis and the Dakotas were compelled to dispose of their product. Mr. Crow asked if it were not a fact that, as had been claimed by North Dakota growers, the latter had lost $15,000,000 one season because compelled to sell through the Minneapolis exchange, this loss having been due largely to improper grading of grain. Mr. McHugh ridiculed the idea, and said that the grain exchange had nothing whatever to do with the grading of the grain purchased or sold through it, but that a state regulated commission handled all that work. Mr. Kegley read from a magazine and a college bulletin wherein Professor Ladd of the agricultural department of the North Dakota Agricultural college classed the exchange as a monopoly.

Convention Divided in Sentiment.

The McHugh-Kegley-Crow affair was a no-decision bout; sentiment in the convention was divided on the character and worth of grain exchanges; but McHugh's address was roundly applauded, and delegates to the convention were free in expressing their appreciation of the enlightenment on the grain exchange question that he had brought.

There was considerable expression of sentiment in the convention favorable to holding the next meeting in Spokane, owing to its greater accessibility and better accommodations for entertaining such a gathering. But the college town won on the vote taken. The attendance at Pullman was cut down heavily this year because of the disagreeable weather. Snow and rain fell during most of the session, and a snow averaging two feet deep and badly drifted in many sections mantled the surrounding country. Notwithstanding these conditions, however, every considerable wheat growing district in the state was represented.

Those in Attendance.

Among those attending the convention were the following:

J. M. Grein, Cheney; L. M. Daniel, Lind; George Ausman, Asotin; W. J. Blanchett, Quincy; W. G. Cordiner, Walla Walla; B. L. Dickinson, Dayton; A. L. Rogers, J. M. Friel, Charles V. Slusser, and M. Malfa of Waterville; Walter J. Gray, Hooper; W. H. Stevens and R. E. Peter, Zumwalt, Ore.; C. B. Kegley, Palouse; J. Vankiren, Bluestem; T. T. Kerl, Coeur d'Alene, Idaho; G. I. Toevs, Samuel Glasgow, R. T. Lord of Spokane; Clarke E. Rathke, Molson; W. J. Jordan, Lewiston, Idaho; R. D. Jarboe, Tacoma; H. E. Goldsworthy, Rosalia; Robert Gunning, Davenport; M. A. McCall, Lind; R. C. McCroskey Jr., Garfield; F. W. Graham, Seattle; M. Harshman, Reardan; W. C. Halsey, Jerry; William Haupt, Colton; R. L. Ireland, Wheeler; E. P. Hinderu, Douglas; George King, Creston; J. P. Cleweno, Colfax; John Kramer, Colton; Joe Kramer, Johnson; W. E. McCaw, Prescott; F. W. Hoggman, Albion; Martin Harter, Albion; O. V. Patton, Walla Walla; George Ruply and F. P. McGuire, Los Vegas, Cal.; J. H. McCroskey, Garfield; George Druffel, Colton; Stanley Rinker, Davenport; C. W. Kitch, Troy, Idaho; H. M. Smith, Walkerton, Ind.; William Banhler, Colfax; R. V. Peringer, Belmont; Otto Pronge, Farmer; M. E. Shreck, La Crosse; F. H. Sharkiel, North Yakima; W. C. Theda, Wenatchee; Edgar Williams, Mohler; and E. A. Bryan, Guy Wolfe, Edward McGuire, Arthur Cole, J. S. Klemgard, F. Stearns, Ed Nagle, L. W. Dawson, W. F. M. Ricketts, J. W. McAllister, A. J. Hosler, E. D. Alvord, Thomas Hayes, S. Bachmann, I. D. Cardiff, E. F. Gaines, George Olson, D. F. Heald, L. G. Thayer, William Hislop, H. Holtz, J. D. Carson and L. C. Crow of Pullman.

Officers elected by the grain association for 1917 were as follows:

President, R. J. Stephens of Spokane; vice president, Thomas T. Kerl of Coeur d'Alene, Idaho; secretary-treasurer, E. G. Shaffer of Pullman.

Executive committee: A. L. Rogers, Waterville; J. M. Friel, Waterville; Steve Halsey, Asotin; F. W. Graham, Seattle; G. I. Toevs, Spokane; R. C. McCroskey Jr., Garfield.

FARM MUST ATTRACT

Financial Success Not Enough.

President A. L. Rogers of the Washington State Grain Growers, Shippers and Millers' association, in his annual address before that organization at Pullman, Wash., last week, sounded what may be termed the keynote of the convention when he said: "All agricultural pursuits must be made attractive and profitable or the balance of the world will go hungry, and this is the reason why thinking people are taking such deep interest in the farmer and his troubles."

Throughout the entire three-day session the idea that country life must become attractive as well as profitable—that neither attractiveness nor profitableness alone can make it successful in the full meaning of the word—continually found expression. Referring to the early movement toward life betterment, President Rogers continued:

Great Awakenings.

"Through these great awakenings the American farmers are fast coming into their own. They are studying the scientific and economic side of their calling. They the sending their sons and daughters to agricultural high schools and colleges. They are beginning to understand the power of organization and cooperation. They are reading the best up-to-date literature. Their farm papers and news journals are edited by the brightest men in our country. They are eliminating waste and cutting down overhead expenses. They are taking great interest in social betterment, sanitation, good schools and good roads. They also are taking time to broaden their vision on the possibilities and responsibilities of the human race as a whole and the vital part they have to play in the game.

"They admire President Wilson's stand on the humanitarian side of many of the civic issues that pertain to agricultural interests and rural life developments. While he is not the originator of these movements, his extended vision along altruistic and ethical lines of the human side has done much towards better cooperation in giving government aid and support to the farming classes by establishing district rural credit banks and rural credit association, by extending government aid in giving better opportunities to the individual farmer in the way of up-to-date methods in the growing of crops through the help of federal and county farm directors, experiment stations and agricultural colleges and by establishing federal trade commissions and giving the farmer a better understanding of supply and demand, markets and prices. All this is commendable and in the right direction, and, gentlemen, do not forget that the inspiration back of all this ground work for agricultural betterments is in the interest of humanity at large as well as for the farmer as a class, because our whole social and business structure rests upon agriculture as its foundation."

The subjects discussed at the grain convention at Pullman were so numerous and the discussions so lengthy that it is impossible to give a full report in one issue of the Farmer. Further features of the meeting will be treated from time to time in subsequent issues.

IRA D. CARDIFF.

Director Cardiff of the state college experiment station at Pullman is confident that victory will be won against smut.

Fictitious Land Values.

President Rogers criticized the placing of "fictitious values" on farm land. He said in reference to the high and ever-increasing price of farm land generally that if the time should come when the farmer demanded prices for his products sufficient to pay dividends on "these watered land values" the interstate commerce commission likely would be called upon to bring public relief from such demands as it has in the past been called upon to bring relief from excessive freight rates due to watered railroad stocks.

Lest he be misunderstood as making undue attack on the railroads by the reference, President Rogers said that "the public must not forget that Americans enjoy the best railroad service in the world and get this service at a lower cost per ton mile and passenger mile than any other people on earth." He added: "We must not tie their hands by too drastic laws and harassing commission, making it impossible for them to adjust themselves under abnormal conditions to the needs of the country."

Among other points made by the president were:

That farming had not been as profitable as we generally supposed.

That "in no other occupation do men go up against so many chances, meet with so many reverses and still exist."

That such meetings as the convention he was addressing had unified sentiment until even grain growers, shippers and millers could meet together in harmony to work for the common good instead of working at cross purposes as they used to do.

That the prospect for continued good prices for farm products is good.

That real progress is made slowly.

That therefore there must not be injected too much revolutionary spirit into the movement for farm betterment.

The speaker brought a roar of applause when making the following reference to concerns manufacturing breakfast foods:

Cost of High Living.

"In justice to our milling friends I want to say right here, that they deny any relationship to the breakfast food industries whose milling plants consist principally of printing presses and lithograph machines. These gentlemen buy much of their product that is offal from standard grades of flour at $20 to $30 per ton. They haul to other buildings and put it into artistic packages. Upon the inside are nicely folded letters treating on health and dietetics, telling how strong and vigorous men do physical and mental labor and wax fat on brand hash, cereal coffees and tule teas. On the outside of these packages are the faces of colored gentlemen and fat cooks and such suggestive words as sweet, delicious and luscious that start the gastric juices of the dear public and they smilingly and graciously hand the package to the good people at 25 and 30 cents per pound.

"Now, my friends, any miller will gladly sell you bran, shorts, middlings, rolled wheat and oats in less quantities than ton lots at 2 and 3 cents per pound, providing you furnish your own sacks.

"Our old friend, J. J. Hill's remark still ring true, 'It is not the high cost of living, but the cost of high living that raises the deuce with our bank accounts.'"

FERTILITY OF SOIL

Is Foundation of Agriculture.

Agriculture is the foundation of our industrial life; soil fertility is the foundation of agriculture; therefore, live stock. This more or less logical idea was the central thought in the address of Thomas T. Kerl of Coeur d'Alene, Idaho. Therefore, also, and probably more important than live stock because necessary to live stock farming in the view of Mr. Kerl, rotate crops.

"To maintain the fertility of the soil is one of the farmer's biggest problems," he said, and followed with a telling argument in favor of a system

(Continued on page five.)

"I Am in the Game for Keeps"

Two Logged-Off Land Dairymen Are Glad They Went Into the Business

This week The Farmer presents the views of two successful dairy farmers—one operating on a logged-off land place near Springdale, Stevens county, in eastern Washington, the other near Montesano in western Washington. No taint of pessimism runs through either of these articles. The writers optimistically declare that they are glad they are in the dairy business and intend to stay with it. The judgment of the eastern Washington dairyman is especially interesting from the fact that he went upon stump land seven years ago, and had never farmed before or had anything to do with stumps and brush. "The dairymen in this state can do as they please," says the writer, "but I am in the game for keeps. I can make a better living and feel more independent than when I was railroading."

Dairying in Eastern Washington.

To the Editor of The Washington Farmer: I have read with a great deal of interest the articles on dairying published in the Farmer and notice that the most of them are from large dairies. Now I for one would like to hear from the little fellows like myself. I bought the place I own now, four and one-half miles west of Springdale, in 1909, early in the spring. I had never farmed before or had anything to do with stumps and brush. There was about eight acres cleared on the 160 and I began to study what I could do to live. Finally I decided to milk cows, so I bought two cows and two heifers for a start. I can say that I have never regretted my decision. I never milked a cow in my life until I came here, and what I haven't had in the line of experience is not worth telling of. Last year I tested out and kept account of the feed and returns from five cows.

Cows No.	Weight	Feed	Butter	Cost per lb.
4	1029	$25.50	365	.710
1	1191	$23.88	237	.1006
3	889	$25.00	182	.1180
2	914	$26.71	171	.1300

I have had two grade bulls, and now own a registered Holstein, and that is another thing I am undecided about, whether it pays to pay a big fat price for a bull calf and after keeping him for two years sell him to the butcher for one-tenth of what he costs, remembering at the same time that I have to wait three years before I get any returns from him. It costs about $25 to raise a yearling, so I do not see how they are worth eight or 10 times that.

I raise my own hay and roots. I can bank on three tons of alfalfa to the acre and 30 tons of carrots. I have always had to buy a little hay, but then I would rather buy than sell. On account of the manure I find that I raise just about double crops than when I started. I have lots of disappointments, but you get them whatever you are doing. I have a heifer fresh now that I banked on for a $100 cow, but she has turned out to be such a hard milker that she never will be any good.

The dairymen in this state can do as they please, but I am in the game for keeps. I can make a better living and feel more independent than when I was railroading. I now own 10 cows and heifers and the bull. My place is all clear of debt. I am kind of handicapped for water, but hope to make enough from the cows to remedy that some time. I want a big tank with heater in it in the corral in this weather. If I had that my cows would do better.

J. J. HAYES.

Dairying in Western Washington.

John H. Taylor, proprietor of Wynooche Home farm, Montesano, Wash.—Has been in the dairy business in the Pacific northwest for 25 years, and thinks the opportunities in his region are better than in the east, "by reason of the mild climate, easily available succulents and the best of markets." He has always sold cream and fed the skimmed milk. The cream goes to the Montesano creamery. He combines but little other farming with dairying, and thinks a cow should return $100 a year to enable the owner to earn good interest on his investment.

To the query, "Are dairymen justified in staying with it?" Mr. Taylor says: "Yes, because it furnishes interesting intensive employment all of the year, keeping up the farm in a high state of fertility."

Answering the question, "What kind of dairy farming do you consider best for your conditions?" Mr. Taylor says: "The kind I am following until some concentrated, cooperative condensery, creamery and cheese plant can be installed that is worthy of the name.

"Wynooche Home farm herd," Mr. Taylor adds, "has just finished the first year in the Montesano cow testing association, with the following average for the herd: Milk, 8757 pounds; butter fat, 495.3 pounds; feed cost, $66.86; value of product, $182.02; profit, $115.15. The year averaged 270 days milking period. Average test for the herd for the year, 5.92. Cost 11 cents to produce a pound of butter fat."

The dairy home of J. H. Taylor of Montesano, Wash., who says dairying is "a year-round job.

Curing Meat

Dry Salting and Sugar Cure

At the "short course" held under the auspices of the Washington State college at North Yakima recently, Professor Thornber gave suggestions on curing meat on the farm.

Dry salting is best for hot weather for preserving small pieces of meat without smoking. Use 16 pounds of salt, four pounds sugar, six ounces of saltpeter per 100 pounds of meat. Rub this into the meat every day for a week, afterward once a week. After each rubbing cover the meat with the salt mixture. Two weeks should be enough for bacon, five or six weeks for hams.

As to the sugar cure let the meat cool a day, then rub a mixture of one part brown sugar to four parts salt into it. Let it lie a day. Then pack into a barrel and weight the meat down. Make a brine of 16 pounds of fine dairy salt, four pounds sugar or molasses, and, if you wish, six ounces of saltpeter per 100 pounds of meat.

Put enough water into this to float an egg. Pour the brine into the barrel. In two weeks the smaller pieces will be ready. The larger ones take five or six weeks. Hang the meat in the smokehouse and build a fire under it. Use apple wood, juniper or corncobs for smoking. After a week take out and hang up. Do not let any water touch the meat after it is smoked.

KANSAS WHEAT

Third Largest Acreage Seeded.

Wheat area sown in Kansas for the 1917 crop is 8,887,077, an increase of 2.8 per cent over the area sown a year ago. The record area sown was 9,447,987 acres two years ago. This year's area is the third largest. The condition of wheat December 1 averaged 75.9. It is 12.5 points lower than a year ago and the lowest in five years.

Here Is Puzzle in Horse Problem

Yearlings and Two-Year-Olds Undervalued—Mature Work Stock High

The following is the second in a series of articles based on replies received from a large number of farmers in response to a questionaire regarding the practicability of raising work horses on the farm. The first article, appearing last week, indicated the average cost of raising a colt to four years to be $115, and that about two-thirds of the farmers of the northwest raise their own work stock.

What seems a statement of facts hard to reconcile with sound business management in the matter of securing horses for the work on the farm, appeared in a considerable number of the replies received by the Farmer in its questionaire on the work horse problem.

Two of the questions asked were in substance: Can a farmer buy his work horses as cheaply as he can raise them? Do yearlings and 2-year-olds sell for relatively as high prices as do mature work stock? The contradiction appeared in this:

Seventy per cent of those replying say horses can be raised more cheaply than they can be bought. Fifty per cent say that yearlings and 2-year-olds do not sell in their communities for prices relatively as high as work horses.

The situation is still more marked by this fact:

Of those who reply that young stock do not sell as high relatively as mature horses, three out of four say horses can be raised from breeding to maturity more cheaply than they can be bought.

A Peculiar Condition.

There are two items in the cost of raising a colt that may be classed as initial expenses: An average of $15 sire service fee and a loss of time to the mother of an average of 30 days, according to opinions of breeders. This loss of time, at 50 cents a day, adds $15, making the initial cost of the colt $30. Thus, at the age of one month the colt has cost his owner $30, or slightly more than one-fourth of the total average cost of raising him to 4 years old, as indicated by the estimates and calculations of those answering the Farmer's inquiries.

At the time of birth and during the first year of his life are the times of risk to the colt. Then the chance of injury or loss is greatest, with the possible exception of breaking time. Assuming that the average cost of raising him to 4 years of $115 is approximately correct, as indicated in last week's article in this series, and deducting the $30 initial cost, there remains $85 for his maintenance during the four years, or $21.25 a year average.

Thus, at the age of 1 year he has cost $51.25; at the age of 2 years, $72.50; at the age of 3 years, $93.75, and at the age of 4 years, $115.

In other words, at 1 year old he has cost 45 per cent of his total cost. At 2 he has cost 63 per cent of his total cost and at 3 he has cost 81 per cent.

These figures would make it seem that a colt 1 year old should bring on the market 45 per cent of what he would be worth at maturity; that at the age of 2 years he would bring 63 per cent of his worth at maturity. Figuring that the period of risk is passed (and also the period of greatest trouble making about the farm), he should bring a higher relative price than this if it pays to raise a horse on the farm at all which the large majority agree it is.

Although no question was included as to the value of the work that an immature horse might do on the farm, several farmers said that after reaching the ago of two and a half years a colt could earn his own keep by taking part in light farm work. Some questioned the advisability of working him under three and a half years. Others expressed the opinion that he was better for it if not subjected to heavy, straining work.

If, as indicated, a colt from 2 to 4 years old can pay all of his way or even a part of it, it becomes all the more interesting that he could not bring a relatively high price when offered for sale at that age.

The probable explanation of the unnatural condition, which it seems undeniably does exist, lies in the fact that the average farmer does not like to put his money into something that does not offer an immediate return in service or cash. If he raises colts from breeding, as it is shown two-thirds of the farmers of the northwest do, he is induced to do so partially because it does not appear on the face of it to require a real cash outlay—because the colt becomes just a part of the routine of the farm. On the other hand the 2-year-old or yearling colt which, in from one to three years will be a full-fledged work horse worth from $150 to $250, according to size and breeding, is likely to appeal to the farmer who may need him later as a call for cash that might better be put into something immediately profitable. And frequently even at less than half what he will be worth when mature he goes begging.

On account of the great variation in local climatic conditions, moisture, soil, etc., it is up to the readers of The Washington Farmer always to remember that methods which prove successful in one locality may not work out in others. It is our aim to gather the experiences of farmers in every section of this state and pass these experiences on to our readers, that they may try out or adopt such as may be applicable to their locality and conditions.

FOR TEMPERANCE

Governor Whitman on Band Wagon.

Governor Whitman of New York has climbed aboard the prohibition band wagon. He has boldly announced that he is in accord with the general temperance sentiment, but he does not say what prohibition measure, statewide, local option or "optional prohibition remonstrance," he will personally and officially support.

Would Require Cleaner Grain

Wheat Convention Wants Grain Standardization Law

(Continued from page three.)

of crop rotation that would both keep the soil in good condition and supply feeds which would demand the keeping of live stock, which would doubly insure the fertility of the soil.

Mr. Kerl told of his own experience with a crop rotation as follows:

Barley.

Clover, sown with the barley for crop the following year.

Oats.

Peas.

Wheat.

Further rotation could be followed successfully if desired with such additional crops as potatoes and alfalfa. He also declared that rotation was a most likely smut eradicator.

"Smut feeds and thrives on one certain thing," he said "Throw in new crops, thereby destroying the food supply of smut, and it seems reasonable that you will kill it."

Hogs on Grain Farm.

Hogs are the one sure profit maker on the common grain farm, according to Mr. Kerl. Sheep are next. Cattle can not be produced on any grain farm under present price and production conditions. He said it takes 56 pounds of a grain equivalent to corn to make from 12 to 16 pounds of pork; 8.4 pounds of grain and 4 pounds of alfalfa hay to put one pound of beef on a 1000-pound steer; and 2.6 pounds of grain and 5 pounds of alfalfa to put one pound of mutton on a 60-pound lamb.

THE SMUT PROBLEM

Gain Is Made Against Grain Pest.

"I personally feel very sanguine in regard to the whole smut problem, so much so that I think in half a dozen years smut may be almost a thing of the past."—Director Ira D. Cardiff of the state college experiment station.

Will very early or very late seeding of winter wheat prevent smut? This in a general way was the question around which discussions of the smut problem centered at the grain convention at Pullman. Director Ira D. Cardiff of the state college experiment station said that experience had seemed to prove the effectiveness of such program. R. C. McCroskey Jr. of Garfield, speaking on the subject while himself not convinced that early and late sowing was a sure smut preventive, said that the experiences of farmers with whom he had been in touch indicated smut reduction could be made by sowing either very early or very late, best results coming from very early sowing.

Some Give It Up.

The problem had been threshed over so many times in the past and the delegates were so familiar with most of the arguments presented that little or no open discussion of the subject was had. There was a sort of what's-the-use sentiment in the convention. One man was heard to say as he heaved a sigh: "I don't believe they will learn how to prevent smut." One little group of growers talking on the subject related experiences of results so diametrically opposite both as to time of sowing and method of treatment of the seed that a listener might well have doubted whether natural laws actually had anything to do with smut or not. But Director Cardiff is not one of the doubters.

Definite Progress.

"Happily we can state that definite progress has been made and tangible results obtained in our efforts to control smut," he said, referring to the work of the college experiment station. Points brought out in his address touching on the smut problem were:

Infection at Sprouting.

That wheat is subject to smut infection only at the time of sprouting; that if seed itself is cleansed of smut spores by formaldehyde or vitriol treatment and is placed in soil also free from smut during the sprouting period, no infection can occur.

He said that by means of "traps" set at many points during the threshing season it had been shown that smut spores to the number of many thousands per square inch settle all over the country from the dust created by the threshing machines. These smut spores, he said, as soon as worked into the ground in the process of cultivation or seeding of the land were ready to germinate, and that if seed were in the ground sprouting at the time of this smut germination, such sprouting grain would be infected.

Therefore, he argued, winter wheat should be seeded before threshing is done or long enough afterward to insure its sprouting either before the smut spores are present and germinating or after they have germinated and died.

One point he made doubly emphatic that treating of seed was not in itself sufficient; that in addition smut must be eradicated from the soil in which the seed was to be placed.

Director Cardiff said that the college station was experimenting with a view to producing a wheat with powers to resist smut infection, and that some progress was being made. He said that of the common varieties now grown some were much more susceptible to smutting than others. Turkey red is much more smut resistant than are red Russian and little club.

WHEAT AND THE WAR

Will Price Drop With War's End?

"No one expected wheat to stay up longer than the duration of the war," said F. W. Graham of the Great Northern railroad, addressing the grain convention at Pullman.

His assertion, though there was no discussion of it in the meeting, was the subject for some comment afterward. Some of the growers express the belief that wheat will fall to no low figure within the next year, even though the war should end immediately. They declare that with a poor prospect for the Argentine crop, as is reported, and with assurances from what many think to be reliable sources that the Russian supply is not great, even though it should become available, there is no reason to believe that the law of supply and demand would rule and keep the price high. Others take the other view, feeling that it is the abnormal demand caused by the war, together with inability to secure adequate water transportation while the warfare lasts, that keeps the price up around the $1.50 mark, and that with the cessation of the war it will fall to a dollar or below per bushel.

Transportation Problem.

Mr. Graham's address was in presentation of the railroad viewpoint in the joint convention. He declared that the car shortage that has handicapped shippers for the last several months was a very natural result of conditions. Grain this year was shipped eastward by rail instead of westward by water, he said, owing to conditions brought about by the war's interference with shipping, and that this required many more cars than usual and placed them on extremely long hauls. "If the roads had sufficient equipment for such abnormal conditions, an enormous percentage of it would necessarily be idle during normal times," he said.

He outlined the efforts of the railroads to be prepared to meet needs as they occurred, and urged the shippers to do all possible to assist the companies in handling the heavy traffic expeditiously and efficiently.

He said that there had been built in the United States during the last three years an average of only 1188 miles of line per year, the least since the civil war. For the 14-year period preceding 1913 the average built per year was 4500 miles. He said that in the state of Washington the railroads paid over one-tenth of all the taxes collected.

There are 10 things that must be in the soil as plant food. If one of them is absent or there is insufficient or unavailable quantity or form, plant life, meaning crops, suffer. Those 10 things are carbon, hydrogen, oxygen, calcium, potassium, magnesium, phosphorous, nitrogen, iron and sulphur.

FEDERAL GRAINS ACT

Is Indorsed by State Inspector.

At the instance of R. D. Jarboe, state grain inspector, the grain convention adopted a resolution urging upon the federal department of agriculture the adoption for the northwest of the system now in vogue in this state regarding discount in grain inspection.

Inspector Jarboe explained that the federal act provided for a uniform system of grading grain throughout the United States. He expressed high approval of the act. The measure was passed by the last congress, and the system and grades therefore have not yet been worked out. The resolution adopted by the convention at Pullman reads in part as follows:

"Resolved, that we favor the continuance of the present system of buying, selling and inspection of grain and respectfully request the representatives of the United States department of agriculture to continue the inspection system now in vogue as expressed by the grain inspection department of Washington and the rules governing same as promulgated by the state public service commission."

CORRUGATE THE FIELDS

Will Prevent Loss of Moisture.

Robert Gunning of Davenport, an extensive farmer of the Big Bend country, urged upon the grain farmers the conservation of moisture and fertilizer

(Continued on page twenty-six.)

Tops Hog Market

Choice Hogs at $10.25 in Spokane

In the words of Office Manager Ray B. Farrar of the Spokane Union stockyards, a carload of 82 head of hogs, bred, reared and finished by James Hayes & Sons of Waverly, Wash., "topped a top market" at the Spokane yards last Saturday. The swine averaged 222 pounds, and were bought by the Carstens Packing company, the highest of four competitive bidders, at $10.25 per hundred.

"To say these hogs 'topped a top market' expresses the actual condition this fine lot of hogs met in competition with other hogs produced in Montana, Idaho and other parts of Washington," said Mr. Farrar. "While much credit is due the particular section in which these hogs were raised, the kind of feed fed them, etc., too much can not be said of the efforts made by Mr. Hayes and his sons, beginning 10 years ago, to develop this hog of standard breed, solid color and strict conformity by crossing the Duroc Jersey and the Poland-China the first year, and thereafter breeding the female offspring of his first cross to the Duroc Jersey boar.

The Feed Question.

"After standardizing their breed of swine, they next turned their attention to the best variety of feed, and by practical experience found that the field pea not only excelled wheat or any other grain native to this section as a pork producer, but produced a class of pork even superior in flavor and compactness of flesh to the pork product of the eastern corn belt.

"Another profitable advantage in conection with pea feeding is the growing of the grain, eliminating entirely the costly process of summer fallow, for, unlike other grains, the pea inoculates the soil with nitrogen and after a number of crops have been harvested successively this same piece of land will produce a greater crop of wheat than would have been grown had the wheat been planted after a summer fallow.

"From the satisfaction manifested by numerous experienced hog growers on our market who have fattened and marketed their stock at a profitable figure in the face of high-priced wheat and other adverse conditions, we think that, with the advent of this new stock feed, the discouraged or half-discouraged grower who has quit or is quitting the business on account of putting more money into his hogs than he gets out of them, must confess that he owes his depression to his lack of knowledge of the industry."

Wool Growers

Washington State Association

By D. G. Sutherland.

At the annual meeting of the Washington Wool Growers' association, held in North Yakima January 3, the following officers were elected:

President, K. O. Kohler, Ellensburg; vice president, T. J. Drumheller, Walla Walla; secretary-treasurer, Dr. Robert Prior of North Yakima.

Advisory board—The officers and Duncan Dunn, Wapato; T. H. Smith and D. C. Goodman, North Yakima, and F. M. Rothrock, Spokane.

Transportation committee—H. L. Anderson, Ellensburg; E. Berg and Archie Prior of North Yakima.

Delegates to the National Wool Growers' association at Salt Lake—T. J. Drumheller, Walla Walla; Dr. Robert Prior, T. H. Smith, Alex McGee, William McGuffie of North Yakima, Anderson brothers, K. O. Kohler, Angus McPherson and John Smithson, Ellensburg; F. M. Rothrock, Spokane.

Committees reported on the mapping out of necessary trails between the winter range and the forest reserves for the purpose of having them withdrawn from entry under the 640-acre homestead law. These trails included the road from Barrel Springs to Leavenworth, the road from the table of Wenatchee mountain to Malaga on the Great Northern; from the "horn" of the Yakima northerly toward all the forest reserves. The report stated that the trail from Barrel Springs was annually used for the movement of over 100,000 sheep.

Thomas McKinzie of Portland, assistant district forester, spoke in regard to the changed attitude of the government toward the sheepmen. He said originally the forest reserve was created and managed with the sole object of preserving the timber and water supply.

The government has come to realize that, to be of the greatest benefit to the greatest number, the sheep men and cattlemen were a large factor, instead of spending all their funds in the prevention of forest fires they proposed to spend a good part of it for the building of trails, salt troughs, and in every way making the range accessible and convenient for the stockmen. A bill is now before congress asking for an annual appropriation for the sum of $100,000 to be used for range improvement. This state has asked for $20,000 of that amount to be set aside as her share.

Increase of Range.

G. F. Allen, supervisor of the Rainier reserve, said there is an ever increasing demand for range for both cattle and sheep. In area we have reached our limit; there are but two ways for a new man to get range, wait for some one to drop out or buy him out, or we must increase our capacity.

The latter can be done by careful management and a small expenditure of money, fully one-third.

Railroad Accommodations.

C. C. Reed, supervisor of the Colville reservation, said the great drawback to the industry in his locality was the high freight rates and the lack of corrals, feed and water at the stock yards. He said it greatly increased the liability to poisoning if the sheep were turned out on the range hungry and without water.

Dr. H. T. Graves of the state department of agriculture stated that, so far as the danger from dogs was concerned, he had the matter well under control, but there was still a great danger from coyotes, but that was beyond his control.

"Loss from Predatory Animals" was the subject discussed by E. T. Averill of the U. S. biological survey department.

Pure Clothing Law.

Bruce McGregor of Prosser said we have a pure food law, a pure drug law; why not have the same thing to apply to clothing.

State College Indorsed.

The work of the state college was unanimously indorsed and resolutions passed protesting against any effort to curtail or hamper its work.

Wreck Record of Baltic Sea.

The wreck record of the Baltic Sea is greater than that of any other part of the world.

OUR GUARANTEE TO SUBSCRIBERS.

Any subscriber who does not feel that The Washington Farmer is worth to him all and more than the subscription price may order the paper discontinued and the unusued portion of the amount paid for the subscription will be refunded. You must be satisfied.

Entered as second-class matter January 13, 1916, at the postoffice at Spokane, Washington, under the act of March 3, 1879.

GUARANTEE OF ADVERTISEMENTS.

We guarantee every subscriber against loss through dishonesty or swindle by any advertiser in this publication; we do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Complaints must be sent us within 30 days from the date of the transaction, and the subscriber must have mentioned The Washington Farmer when writing the advertiser. This guarantee applies to live stock, except that we will not be responsible for claims for damages on account of disease in stock sold through these columns.

More Wholesome Living

It is the cheerful custom of our times to urge what amounts to improvidence and insist that the liberal spending of our money is for the best, not only for ourselves, but for everybody. Every effort to reduce living expenses is frowned on and considered as a mean and underhanded attack on some industry which ought to be encouraged. If we do not wear gold rings, we are not treating the gold miners right, nor are we giving the jewelers a fair shake in business. How can we expect the jeweler to buy our pork and sauerkraut if we do not buy his gold rings? We are hurried on to make more that we may spend more with others, so that they may spend more, and so on, and so on.

There is no end to this sort of thing, and there is no health in this kind of hectic existence. The principle of making more that we may spend it faster is not a worthy basis for our philosophy.

A little economy would be a wholesome thing for all of us and would help amazingly in the matter of the high cost of living.

Teaching "Frills and Fads"

The easiest thing in the world is to criticize, to knock, to find fault. That is just now our easily besetting sin. If we want to have what we say printed we "rap" somebody, or something.

The teachers and the public schools are good game for everybody. We can rap them with impunity. "Not half the teachers are fit to teach," says one.

The schools spend all their time on new "fads" and useless "frills" says another. "Let the scholars confine themselves to readin', 'ritin' and 'rithmetic like I used to do." When anything constructive is offered it is called a "fad."

Everybody grants the usefulness of those simple tools to be used in our education and in the business of life, namely, the use of language and numbers, and at least an elementary knowledge of men and places (history and geography). But elementary education means much more than this, and the struggle of modern education to coordinate our education with the life work which we are to do is deserving of all praise and appreciation.

We are just learning that we learn through our hands and eyes and ears as well as through words. We are acquiring the habit of studying the real thing instead of what somebody has said about it. So instead of decrying the newer methods and the newer substance of school work, instead of hammering the teacher over the head because he doesn't follow the parrotlike methods used when you were young, it would be better if you preserved the open mind, if you would duly consider the subject matter presented, the ends in view and the means to be employed in securing the highest efficiency.

In other words, you should maintain the attitude of sympathetic friend and helper, instead of that of a carping and self-sufficient critic. The schools are by no means perfect, nor has the final word been said of pedagogical means or ends; nor is the school the only instrument of education; but the knocks and kicks render to it a doubtful service. E. A. BRYAN.

Silos and Silage

While silos and silage are but just beginning to show what they can do in live stock production, and that there is not the least doubt in the world that silos will multiply rapidly throughout the Pacific northwest, yet there are doubtless limitations in the use of silage. For instance, here is C. H. Walters, cattle dealer and farmer, of Chehalis, in western Washington, who is not at all sure that silage is the best feed for his purpose.

"I've talked with a good many people who ought to know, and they all agree that it takes stock a little while to get used to silage," he says. "Now with us, the cattle we buy are fitted for market and resold, and, if during the time we have them on our hands they are going to be off their feed learning to eat silage, I don't believe a silo would pay us. For milk production the requirements are probably different."

Mr. Walters believes that the western Washington farmer who understands his business can raise all his feed. "With alsike clover, roots and grain he can finish cattle in good shape. Red clover also does well here, but is more apt to grow big and then fall down before it is cut than alsike. Wheat and oats do better around here than barley, while corn is still a good deal of a gamble."

He adds that a good many feeders are being shipped out of Chehalis, but as yet comparatively few finished cattle.

Great Fall Wheat Acreage

The American farmer shows a continued willingness to do his part to provide bread for a hungry and warring world. As shown by a recent report of the United States department of agriculture, he has put 40,090,000 acres into winter wheat, the greatest ever planted, with the exception of the 40,452,000 acres seeded two years ago, and 10 per cent greater than any seeding prior to the fall of 1914. The 1915 winter wheat acreage was 39,203,000.

This season's winter wheat seeding in the Pacific northwestern states, as compared with the acreage in 1915, are as follows:

	1916.	1915.
Washington	754,000	867,000
Idaho	346,000	364,000
Oregon	472,000	590,000
Montana	775,000	775,000
Total	2,347,000	2,596,000

It is thus seen that while the United States in general has put in a larger winter wheat acreage this fall than in 1915, the Pacific northwestern acreage has fallen off about 10 per cent.

But while the acreage is large, the condition of winter wheat is below normal. It is 2 per cent lower than last year at this time, and 4.5 per cent lower than the 10-year average. "The low condition," says the government report, "is almost uniformly ascribable to the lateness of planting, which has prevented wheat from attaining its usual growth at this time, and in some instances late seedings have not yet germinated. Little mention is made of the Hessian fly, although it is in evidence to some extent, particularly in Kansas.

"The high price for the present year's crop had encouraged an intention to plant a largely increased acreage, but the unusual dryness at seeding time throughout practically the entire winter wheat-producing territory largely prevented these intentions being realized."

A Shorthorn Sale

The Shorthorn breeders of the northwest have decided to hold a sale of breeding stock in Spokane early in April. Heretofore the sales of the association have been held in North Portland, Ore., and the last one was an excellent one. But there is a field for similar sales particularly in eastern Washington.

The Shorthorn men have studied the matter carefully and have come to the conclusion that this sale shall be chiefly of male stock. The date will be early enough to get the sires to the farms and ranches in time for the breeding season. An effort is to be made to interest the ranchers of eastern Washington, northern Idaho and western Montana in the excellent sires controlled and for sale by the members of the association, which embraces practically all Shorthorn breeders.

According to the records of cow-testing associations, fall freshening cows are more profitable than spring freshening cows. Whether this condition would continue if a majority of cows freshened in the fall is doubtful, for the difference is due to the price of fat.

The federal government is investigating the possibility of using shark skins for leather. Why not make it embrace the skins of all predatory animals, not forgetting to include gamblers and confidence men of all sorts?

Scientists say courage is a matter of temperature. Probably that explains the use of the term, "cold feet."

Washington Gleanings

Walla Walla's two Methodist churches have been consolidated into one.

Nine hundred and thirty-five acres of wheat land near Pomeroy in Garfield county have been sold for $84,000.

Wenatchee will have a fruit byproducts plant the coming season, and it will make cider, vinegar, jellies and evaporated fruit.

Three farms in the vicinity of Wilbur, in the Big Bend country, totaling 1036 acres, have been sold recently for a total of approximately $50,000.

The Clarke county prune crop of the last season amounted to seven and a half million pounds and is valued at more than half a million dollars.

The Washington State Bee Keepers' association has made formal recommendation to the Yakima county commissioners that a county agriculturist be employed.

The establishment of a large city market on the site of the National Apple show under the elevated tracks of the Milwaukee railroad, is being considered by Spokane.

The fancy prices being paid for fur are said to be doing much to discourage those who have been advocating increased bounties on coyotes, wildcats and the like.

One of the noticeable features of the postal service this year during the holidays was the shipment of large numbers of turkeys, geese and other dressed poultry by parcel post.

The prison jute mill at Walla Walla is manufacturing about 6000 grain bags daily. It is expected that the price next season will be fixed by the board of control at not less than 10 cents.

The Washington state board of finance has made recommendations to the legislature asking that over $20,000,000 be appropriated for the conduct of state affairs during the next two years.

What Others Say.

Dakota Farmer: The other fellow may be farming better than you are.

Farm Life: You can take figures and prove things that clearly are not true.

Country Gentleman: No set of rules that can be laid down will meet all circumstances.

Inland Farmer: The man who knows best how to manage a farm will eventually be the man who owns one.

Banker Farmer: Even today comparatively few persons realize the importance of fostering agriculture.

Hard to "Bear" Wheat

Outstanding Facts Are on the Side of the "Bulls"

All efforts by "bear" traders to beat down the price of wheat seem unavailing. The outstanding facts are with the "bulls," and it is certain that the world will not see cheap wheat before the next harvest, with strong indications that good prices will continue throughout 1917.

The International Agricultural institute of Rome, Italy, finds that the world wheat crop in 1916 was 25 per cent less than the crop of 1915, and authorative information from other sources bears out that calculation.

The official estimates of the Argentine wheat crop is given in a cable to the Northwestern Miller at 77,000,000 bushels, against 172,415,000 bushels last year.

The French National Millers' association is reported as estimating the French wheat crop at 56,999,000 quintals of 220.2 pounds per quintal, which with the stocks on hand represented a total of 63,841,000 quintals against requirements of 92,325,000 quintals. The deficit of 28,484,000 quintals, or 104,536,000 bushels, represents the requirements of foreign wheat. According to the commercial reports the French imports of wheat this season to November 27 were 44,000,000 bushels, against 15,000,000 bushels a year ago.

The Russian wheat crop this year estimated by the International institute at Rome at 594,000,000 bushels or 152,000,000 bushels less than last year, and compares with a five-year average of 624,000,000 bushels. Rye crop, 840,000,000, or 53,000,000 less than last year.

Throughout Europe farming conditions are very much run down as a result of the war. In the British isles, for example, shortage of labor for farm work and for the production of agricultural machinery seriously menaces crop production, the surveyor's institution declares in an appeal to the board of agriculture. The appeal says in part:

"The acreage under wheat this year was more than 250,000 acres less than in 1915, a loss which was not made good by a corresponding increase in the area under other cultivated crops, and, although the official estimate shows a decrease in the 1916 yield of nearly three bushels per acre compared with the 10 years' average, the threshing returns as they come in seem to point to a diminution in yield even greater than that estimate. Unless immediate steps are taken to enable the land to be prepared for next year's crops, not only will a full output fail to be attained, but results even less favorable than those of 1916 must follow.

"We fully appreciate the need of men for the army, but this does not blind our eyes to the fact that labor is urgently required for the manufacture of agricultural machinery and the proper cultivation of the soil.

"Should nothing be done to provide for these reqüirements, land can not fail to go out of cultivation for want of labor to till it, while that which remains under tillage will grow inferior crops owing to the impossibility, under existing conditions, of keeping it properly worked and manured, or of attending to such matters as drainage, ditching and cleaning, all of which have been largely neglected for the last two years, with the result that land is fast getting into a foul, waterlogged and unproductive state."

Undoubtedly similar and probably worse conditions exist in France, Russia, Italy, Austria-Hungary and the Balkan states, and to some extent, at least, in Canada and Australia. If the war goes on these adverse conditions will grow worse; and even if peace should soon be negotiated time will be required for the warring countries to put their agriculture back to normal production.

MADE MILLIONS
How Wealth Can Add to Itself.

It is a striking commentary on the way in which corporate wealth increases of itself that the Standard Oil holdings alone of the late Charles W. Harkness, who died May 1 last, increased in value $7,618,991 between that day and December 7, when the appraisal of his fortune was disclosed, says the Boston transcript. Between the man's death and the rounding up of his possessions, this one block of his $60,000,000 of property had grown by that enormous sum, and while the man himself lay in his grave.

"Let's Hope Hit Ain't So."

In "The Men of the Mountains," Arthur W. Spaulding quotes a touching little story of one of those isolated homes among the Appalachian hills whose occupants seldom hear the voice of prayer, have never seen a Bible and could not read it if they had it. A minister visiting the home for the first time told the little family the story of the cross. They followed him with rapt faces, and, when he had concluded, the mother, leaning toward him, whispered hoarsely:

"Stranger, you say all this happened a long time ago?"

"Yes," he said, "Almost 2000 years ago."

"And they nailed him to that thar tree when he hadn't done nothing to hurt' em; only jest loved 'em?"

"Yes."

She leaned farther and placed her hand impressively upon his knee. "Wal, stranger," she said, the tears standing in her eyes, "let's hope hit ain't so!"

School Lands

And Farm Loan Associations

O. C. Musgrove, secretary of the Elma, Wash., national farm loan association, writes that he has been "instructed by the association to ask your advice regarding a man on school land borrowing money on his improvements on said land."

The law seems clearly against a loan of that character. It provides "that no federal land bank shall make loans except upon the following terms and conditions," and the first condition is that "said loans shall be secured by duly recorded first mortgages on farm land within the land bank district in which the bank is situated."

Title in fee simple is made the essential qualification, and additional loans on improvements on land seem clearly incidental to this purpose of the law. On this point the act says: "No such loan shall exceed 50 per centum of the value of the land mortgaged and 20 per centum of the value of the permanent, insured improvements thereon."

LAND IN CANADA.
Stretches of Unknown Territory.

Within the borders of Ontario are three tracts of 6000 to 8000 square miles each that no white man has ever explored. It is estimated that east of Reindeer lake and Kasan river is a region of 73,000 square miles area, larger than New York, New Jersey, Connecticut and Massachusetts combined, which is yet to be explored. Altogether there is an aggregate of 901,000 square miles of country which should be represented on the map by whiteness, and this calculation does not include unexplored areas of less than 4000 square miles.

WHEN KNIGHTHOOD WAS IN FLOWER

More Silos

Coos County Now Has About 250

In his report County Agricultural Agent J. L. Smith of Coos county, Ore., says:

The result of the county-wide campaign for more and better corn silage carried on by means of corn growing contests and shows is already apparent in better seed selection and an increase in acreage of at least 100 per cent in the last three years. While the chief object of growing corn in this county is for silage, it is very important to produce seed corn here at home which is acclimated to the peculiar climatic conditions of this section.

The increased acreage of good quality silage corn has resulted in the building of a large number of silos. There are now approximately 250 in the county, one-half of which were built within the last three years.

JUST A BRICKBAT
Flung at John Barleycorn's Jaw.

Sociologists, philosophers and Utopians of all sorts who have dreamed of abolishing poverty had better watch out or they will find their occupation gone, says the Kansas City Star. Practical, common-sense people are getting rid of a good share of poverty under their very noses and with no more elaborate machinery than a brickbat flung with unerring aim to the point of John Barleycorn's jaw. Oh, of course, there are other causes. But right at our door Kansas shows how important a part in preventable destitution is played by booze.

Soda Fountains on Trains.

Soda fountains are to be place in the dining and lounging cars of fast through trains on one of the western railways.

What Japanese Can Teach Us

Constantly on Watch to See How Others Work

C. Jorgensen, who has lived on his present farm near Renton, Wash, since the days of "blanket Indians," between 30 and 40 years, has something to say on the oriental help problem which throws a new light on Japanese characteristics.

"I was one of the first farmers in this neighborhood to employ a man solely for milking," said Mr. Jorgensen to a representative of the Farmer. "My milk business had grown to a point where I needed such a man, and I sent in to an employment agency in Seattle and was furnished with a white milker. For a week I got up every morning to show him how to handle the work. Then I turned the matter over to him and thought no more about it till one evening, when I came unexpectedly into the barn, I found him pounding one of the cows, which had accidentally switched him across the face. I asked him if that was his method for making a cow gentle, and he flew off in a temper. The result was that he quit that night.

"Next morning a Japanese boy, who had been sawing wood for me, came to me and asked if the new milker had quit. I told him he had.

"'Me try!' he said.

"I asked him if he could milk, and he said again, 'Me try!' I told him I would get up mornings and help him learn the ropes, as I had the white man, but he said he knew all about it. I got up anyhow, and found that he was telling the truth—while he had sawed wood, he had also been watching the way I did my work. Well, to make a long story short, that boy did my milking without a hitch, till he was ready to rent a place for himself. Then he brought me one of his countrymen, who was also a good milker, so that I had no trouble in the matter."

This is a typical instance of Mr. Jorgensen's experience with Japanese help. He has found the little brown men absolutely reliable, and has never known one to break his word in the slightest respect.

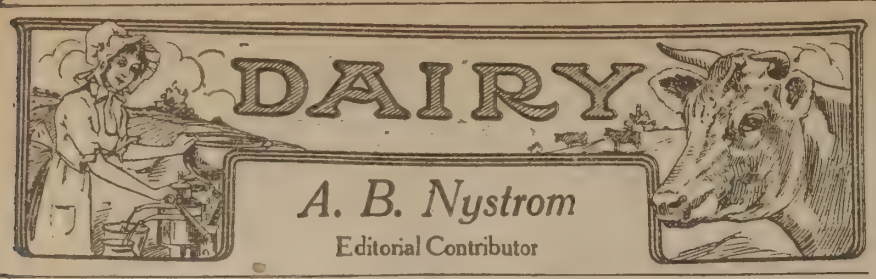
"I wish I could say as much for the white men I have employed," he adds. "That's what makes the Japanese problem so serious—in some respects, at least, these people are our superiors. Can we keep them down in the future, as we have in the past? Is it just for us to do so? Is it possible? I don't know what the answer is to these questions, have to face and solve them."

WEYERHAEUSERS
With Capital of $12,500,000.

The Weyerhaeuser Timber company, with a capital of $12,500,000, and with its head offices in Tacoma, has just filed articles of incorporation. The company is one of the largest, if not the largest, of its kind in the world. The officers and trustees are as follows: John P. Weyerhaeuser, Tacoma, president; F. S. Bell, Winona, Minn., viec president; George S. Long, Tacoma, secretary; F. E. Weyerhaeuser, St. Paul, Minn., treasurer; F. C. Denkmann, Rock Island, Ill.; William Carson, Burlington, Iowa; H. J. Richardson, St. Paul; H. H. Irvine, St. Paul; F. H. Thatcher, Winona, Minn.; W. L. McCormick, Tacoma; M. Musser, Muscatine, Iowa, all being trustees, including the officers.

Sheep Industry

Is Improved by Cooperative Plan



How the sheep industry in Gallatin county, Mont., was bettered by community cooperation is told by G. M. Lewis of Manhattan, Mont. For years sheep have been produced in that section, but large flocks only. In the year 1912, however, one of the large flocks was disbanded, owing to financial difficulties. Speaking of it, Mr. Lewis says:

"I bought 50 and the balance were scattered throughout the valley in bunches of from 15 to 50. The lambs thus raised about the farmers' dooryards were much superior and produced larger per centages, but these isolated farmers could not market their buck lambs in these small lots.

"We therefore formed the Gallatin Valley Sheep Breeders' association and have sold yearly every lamb of each member. We advertised in state farm papers and sent type car to our state fair each year. Here the sheep men bought most of the lists we had to offer. We buy our wool sacks and twine and pool our wool. We have a big annual meeting and a sheep show at Bozeman during college conference week. The best buck and ewe lamb prize is hard fought for each year."

LESS INSANE CASES
Dry Law Saves Men and Money.

Owing to the dry law, insanity cases from drunkenness received at the Washington state asylum at Steilacoom have fallen off over 300 per cent. As an illustration, in 1915 there were 38 men and six women received whose insanity was caused by drink. In 1916 there were only four men and one woman.

Municipial Dairy

Says Pennsylvania State Grange

By Richard Hamilton Byrd.

The Pennsylvania state grange, perhaps the most powerful state organization of the grange in the country, proposes the establishment in Pennsylvania cities of a municipal dairy which shall handle not only milk but also butter and eggs, establishing a direct relationship between the producer and the unified distribution system of the city.

The grand master of the state grange, John A. McSparran, made the report demanding these innovations. He used milk as the most impressive illustration of the injustice which present conditions impose on both the producer and the consumer, employing the same analysis and arguments that have been advanced months ago in Washington, when it was proposed to establish a municipal dairy; but he expanded the argument by showing that butter and eggs could and should properly be handled by the same municipal dairy organizations in order to relieve producer and consumer from the exactions of the "egg trust kings" and the "butter trust kings."

The Pennsylvania organization took steps toward a general investigation of the cost of producing and marketing these articles. Committees were authorized to effect a cooperation between the producers in the country and the organizations in the cities and towns, such as housewives' leagues. consumers' leagues and the like.

Bumper Crops.

That the farmer receives less money for his bumper crops than he gets for his lean ones, although the handling of the one involves infinitely more labor than the gathering and marketing of the other, is a statement made by William J. Showalter, a Washington economist, in a paper brought to the attention of the house of representatives by Representative Flood of Virginia in connection with the high cost of living issue. He shows how the farmers of the world received a billion dollars less for their bumper grain crop of 1912 than they got for the lean one of 1911, how those of the United States received $172,000,000 less for their bumper corn crop of 1912 than for their lean one of 1911, and how the wheat growers got $64,000,000 less for their bumper wheat crop of 1906 than they did for their lean one of 1907.

"While congress is considering the high cost of living from the standpoint of the city consumer," says Mr. Showalter, "it might also consider the high cost of universal bumper crops to the farmers who produce them. A study of the statistics of the department of agriculture will show that bumper crops, with all the extra labor they involve, bring the farmers shorter returns than the lean ones.

"All the world understands, of course, the law of supply and demand, and knows that big crops mean lower per bushel prices. But to take both world-wide, all-crop statistics and national single-crop statistics and to find that without exception the bumper crops bring less money in the aggregate to the farmer than the very lean one is to disclose a condition in the economics of food production that is at once surprising and important."

Plant Food Duties.

How many farmers have a definite, clear idea as to the exact mission of fertilizers? Professor Van Slyke of the New York station defines a fertilizer as being any substance which, added to the soil, will, under favorable conditions, produce a better growth of crops, whether by direct or indirect action on the crop or on the properties of the soil. Dr. A. D. Hall, late director of the famous English experiment station at Rothamsted, says that fertilizers are designed to supply deficiencies in the soil, and for all practical purposes are to be regarded as consisting of compounds of nitrogen, phosphoric acid and potash.

Quality

How to Secure in Dairy Products

In a recent address before the commercial club at North Yakima, Roy P. Bean of the U. S. department of agriculture said:

"It costs under local conditions from $45 to $60 per year to feed a cow alfalfa hay, silage, pasture and perhaps a little grain. This means that the average cow consumes the value of about 200 pounds of butter fat per year. Therefore the cow producing about 250 pounds of butter fat, the average cow of the state, is paying a net profit of approximately 50 pounds of butter fat which has an average value of 30 cents per pound. The cow producing 300 pounds of fat per year returns twice the net profit of the 250-pound cow on approximately the same investment of initial cost and feed bill. She is worth more than two of the 250-pound cows to the man who owns her and to the industry.

"This increase in quality can be secured in four ways:

"First—By buying only good cows.

"Second—By breeding for improvement.

"Third—By systematic milk and feed records.

"Fourth—By better care and management.

"The commercial club and its individual members can help develop the most important industry in the valley by assisting farmers to buy good cows. Do not understand me to say that all farmers should own cows—that is a too common mistake, for not all farmers are dairymen nor will they ever be successful at dairying. When I say "assisting the farmers to buy cows," I mean making it possible for them to borrow money at a reasonable interest rate and upon acceptable terms with both parties to the transaction properly protected."

Cow Testing

Snohomish Valley Association

The Washington Farmer is glad to receive from Chester C. Farr, county agricultural agent of Snohomish county, the report of the Snohomish County Cow Testing association for the seventh testing month. C. H. Bergstrom is the tester.

A grade Jersey, five years old, belonging to D. F. Sexton gave 815 pounds of milk testing 6.85 and producing 55.82 pounds of butter fat. A grade Holstein belonging to F. L. Krassis, 3 years old, gave 1314 pounds of milk testing 3. 95 and producing 51.89 pounds of butter fat. The third cow in the association producing more than 50 pounds of butter fat belonged to Shadinger Brothers, a Holstein, 3 years old, giving 1476 pounds of milk testing 3.4 and producing 50.18 pounds of butter fat. Ten cows in the association produced over 40 pounds of butter fat and the average value of the product of the 10 cows was $22.30, average feed cost per 100 pounds of milk, 89 cents. Ten other cows in the association produced between 30 and 40 pounds of butter fat giving an average value of products at $16.82 and an average feed cost per 100 pounds of milk at 90 cents. Comparison of these averages show that the 40-pound cow costs less than the 30-pound cow, while the 50-pounds animal is still less expensive a producer.

Stenographers.

According to the census reports 263,315 girl stenographers and typewriters are employed in the United States.

Dry Off Cows

Don't Cut Down on the Fuel

When some of the dairy experts got together for informal talks, during the meeting of the Washington State Dairy association, recently held at Auburn, the sparks of knowledge flew.

"How do you dry off your cows?" a breeder from Grays Harbor county demanded, addressing a King county man. "Starve them for a month? Well, that's the wrong way. Cut down the supply of succulent feeds a little, if you want to, but don't cut down on the real fuel and tissue formers; if you do, you'll weaken your animal and set her just that far behind.

"That matter of keeping vitality at a maximum all the time is one of the greatest importance," the speaker continued. "That's why it is that heifers are no longer being bred as early as they once were. If the Jersey drops her first calf when she is 26 months old, and the Holstein at 30 months, you will find that you will have a young cow rather than an undeveloped heifer for your first milking period. And the added vigor and vitality will show in cow and calf right from the start. Another thing: Don't imagine for a moment that you've got to keep the heifer lean at this critical time—let her get as fat as she will under generous feeding. She'll milk it all off soon enough, if she comes of a milking strain. A cow that has it in her to make a big milker will never put on too much beef. She simply can't do it."

Year's Work

Arlington Cooperative Creamery

The Washington Farmer has received from Chester C. Farr, agricultural agent of Snohomish county, a statement of the business done by the Arlington Cooperative association for the year ended November 30, 1916.

From these figures it appears that nearly a million and a half pounds of cream were received to make butter, and a million and a third pounds of milk to make cheese. The average price paid for butter fat was $.336; average cost of cream $.245; average cost to make butter $.034; profit per pound of butter $.01. The butter sold at an average price of 30 cents

This association made 126,191 pounds of cheese, selling $125,491 worth of cheese. The average price of cheese sold was $.164 and the cost of making $.029.

Dairying

U. S. Bureau of Animal Industry

Through the organization of cow-testing associations, bull associations and the extension of assistance in establishing the dairy manufacturing enterprises, the United States bureau of animal industry reports that it has helped to place dairying in many sections of the country on a more stable and profitable basis. Marked progress was made through demonstrations and assistance of field men in the building up of cheese manufacturing industries in the mountainous regions of the south, among the Rockies, and in the Pacific coast country. In cooperation with a number of cities, surveys of sources of milk supplies were made and suggestions offered for bettering sanitary conditions.

Raise Your Calves on

Blatchford's Calf Meal

and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk.

Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Blatchford Calf Meal Factory, Dept. 58 Waukegan, Ill

"Neutral" Fruit Grader

Is Advocated by Oregon Fruit Handler

George C. Gladden of the Pioneer Packing House of Hood River, Ore., told the growers attending the eleventh annual convention of the Washington State Horticultural association at North Yakima last week that an orchardist can hardly be trusted either to thin or to sort his own fruit. The orchardist, not the one who buys his fruit, is the loser, Mr. Gladden said, as the temptation to leave too many apples on the trees and to grade fruit too closely, thereby placing an inferior fruit on the market, is too great.

Community Packing House.

A community effort and a community packing house is the remedy offered. Such house should have an experienced, square-dealing superintendent, completely disinterested in the personnel of the fruit growers whose fruit he handles. This will tend to assure grading on the basis of quality only, and all those speaking at the convention said that the real problem in the northwest was to produce a grade of fruit so far superior to that produced in the east that it would command top place on the market and thereby overcome the handicap now existing as a result of the greater cost of production and marketing western fruit.

J. F. Sugrue of Cashmere said that eastern apples could be placed on the market at $1.50 a barrel, while it required $3.75 to place western apples on the same market. The problem, he agreed, was to produce a fruit whose superfine quality would overcome this differential.

Community Effort.

The conduct of orchard business through community effort has proved beneficial, said the Oregon packer, in enabling the orchardists to secure more capable help, in insuring more nearly uniform grades, in saving costs of hauling to the railroad and providing better buildings and equipment for picking, storing and packing. He cited one pertinent example of cases where auto trucks have been installed to gather up the fruit from the individual orchards and haul it to the central packing house, and thence to the shipping point.

Loren F. Dumas of Dayton urged the keeping of accurate accounts of costs and profits, especially the former. He recommended that a score of orchardists agree among themselves to keep exact accounts and outline their methods, regular reports to be filed with some one who would tabulate them and thus aid in arriving at a standardization of orchard cost.

Charles Uhden of Spokane told of his partially successful efforts to secure equitable freight rates and shipping service. He urged more unified support of this work by the growers.

Paul H. Weyrauch, president of the Fruit Growers' Agency association, outlined the work of that branch of the work, explaining that the object of the organization was "to stabilize the fruit industry of the northwest so as to secure for the grower and others interested a just and equitable return for their investment and their labor." He told in detail of the successful operation of the association.

Officers elected were: President, J. F. Sugrue, Cashmere; vice presidents, J. L. Dumas of Dayton and H. W. Des Granges of Kennewick; secretary, Luke Powell, Prosser; treasurer, Ed Remy, North Yakima.

Among the resolutions adopted were those favoring:

An irrigation experiment station in central Washington; federal law permitting apples to be stored in cold storage more than three months; anti-strike legislation; increased appropriation for the state college to be used in increased horticultural activity; barring from this state of seed from alfalfa infected with weevil, and the keeping of cost records by members of the association.

Dairy Output

Valued at $20,000,000 in Oregon

During the period covered by the records in the dairy and food commissioner's office there has been a marked increase in the amount of butter, cheese and condensed milk manufactured in Oregon.

The following tables show the increase in the number of creameries, cheese factories and condenseries, and the amount of butter, cheese and condensed milk manufactured:

Butter—

Year.	Number of Creameries.	Pounds of Butter M'f'd
1901	50	1,680,035
1903	70	4,500,000
1905	60	No record
1907	90	No record
1909	106	No record
1914	98	13,336,387
1915	100	13,643,728
1916	105	16,288,396

Cheese—

Year.	No. Cheese Factories	Pounds of Cheese M'f'd
1901	20	1,185,763
1903	40	2,500,000
1905	58	No record
1907	63	No record
1909	63	No record
1914	62	7,453,255
1915	68	6,896,887
1916	74	8,951,908

Condensed milk—

Year.	No. Condenseries	Lbs. Cond'd Milk M'f'd
1905	3	No record
1909	6	No record
1914	7	19,580,736
1915	7	21,270,900
1916	7	27,116,002

Every possible agency is being used at the present time to develop and build up the dairy industry, of which one of the most active is the Cooperative Cow Testing association. Our first association was organized early in 1911, and in 1912 we had one in operation, in 1913, one; 1914, 7; 1915, 11, and in 1916, 15. These are located as follows: Coos county, 5; Tillamook county, 1; Clatsop county, 1; Washington county, 1; Yamhill county, 1; Polk county, 1; Marion county, 1; Clackamas county, 1; Multnomah county, 1; Umatilla county, 1; Malheur county, 1.

We feel that we have reason to be proud of our dairy record for the year just ended, at the same time as we look into the future we find that we still lack much that is to be desired before we shall have reached that place in the rank of the foremost dairy states, to which we should aspire.

The greatest factor that we can name in achieving such place and results is the exercise of greater care upon the part of Oregon dairymen and creamery men in the production of good, clean-flavored cream and a higher quality of butter.

LESS LIVE STOCK

Sunnyside Irrigation Project.

The annual census of the Sunnyside irrigation project, just completed by J. G. Heinz, assistant project manager, shows a decrease in all farm animals except cattle. Good prices and the expense of feeding high-priced grain and hay are responsible for the selling of so many farm animals. Farm equipment has increased $52,218.

Purebred Registered Holstein Cattle.

During the fiscal year ending April 30, 1916, there were reported to the Advanced Registry Office of the Holstein-Friesian Association, 11,868 short time official records, over one-half of which were by heifers with first or second calves. The average seven-day production of these 11,868 animals was 401.1 lbs. of milk, containing 3.53 per cent of butterfat. These figures emphasize the fact that Holstein merit is based, not on individual records, but upon the wonderful uniformity of high productiveness of the purebred Holstein cow. There is big money in the big "Black and White" Holsteins.

Send for FREE Illustrated Descriptive Booklets. The Holstein-Friesian Association of America, F. L. Houghton, Sec'y, Box 205, Brattleboro, Vt.

Scours Lead Direct to Calf Cholera

And Calf Cholera kills thousands of calves. The digestive organs are paralyzed; food lies in an undigested mass in the stomach; it sours and ferments and decomposes. Do you wonder that so many calves die in a few hours after cholera strikes?

Dr. David Roberts' CALF CHOLERA REMEDY

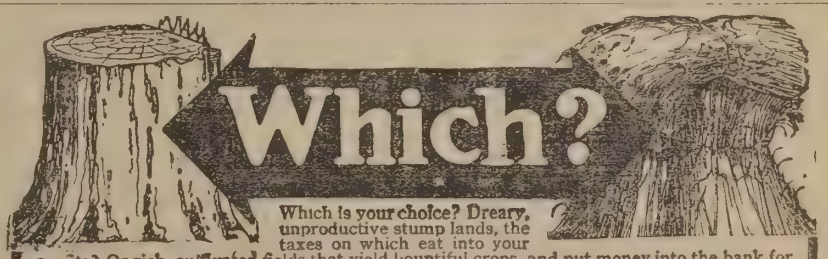
overcomes the trouble by righting the digestive organs. It regulates the flow of gastric juice and soothes and heals the sore mucous membrane. It liquefies the poisonous gases already formed in the stomach and prevents fermentation. Digestion becomes normal and the disease is ended. Don't let the trouble go too far. Begin with Calf Cholera Remedy right away when scours appear. The disease is contagious.

Laxotonic relieves stoppage of the bowels, which, in seventy-five per cent. of cases, is due to paralysis of the digestive organs. Ordinarily, this animal disorder is treated for constipation, which oftentimes results in the animal's death. Laxotonic removes all risks.

Cow Cleaner helps cows at calving time. Cleans and removes the afterbirth naturally: leaves organs in healthy breeding condition. Use *Antiseptol* to soothe and heal soreness of genital organs.

Cow Tonic aids digestion, tones and conditions the cow system, keeps up appetite and prevents falling off of milk.

Breeding Tonic prepares and conditions for breeding. Calves are dropped naturally, complications are avoided. Use also for breeding mares, ewes and sows.



Calf Meal, Diolice, Badger Balm and Stokvigor are also Dr. Roberts' Prescriptions which mean better live stock.

Get Dr. Roberts' Live Stock Prescriptions at your drug store—nearly 4000 dealers in United States. Don't by any means accept any package of animal medicine that does not have Dr. Roberts' picture on the front. Look for it—it's your assurance of healthy, profitable stock. If you do not have Dr. Roberts' 184-page "Practical Home Veterinarian," treating all diseases of all live stock, enclose $1.00 and receive copy by mail. Address

Meats

Production and Marketing Of

By Richard Hamilton Byrd.

A most interesting study of the production and marketing of meat has been made by the bureau of animal industry, department of agriculture. It will be news to most people, that one-third of the hogs raised in this country are still killed on farms. "Hog killing time" is a period in which the farm in the east and south reverts to the primitive economics of colonial days; the hogs are killed, scalded, scraped, cut up, and then manufactured into their myriad products; the hams and bacons and shoulders are cured and finally smoked; the "country sausage" is flavored to the taste of the family epicure, who knows exactly what he wants and has small regard for the models of the big commercial packing institutions; head cheese, scrapple, "pud'n'," and all the rest of the seasonable delicacies are produced just to the fancy of the folks who are to consume them; and altogether it is quite the most interesting and entertaining operations of the old-fashioned farm.

Another statement is made that the great central markets of the country now handle four-fifths of the sheep, two-thirds of the hogs, and half the beef cattle of the country. Instead of a "big four" or "big five" of packing concerns handling the whole business, it appears that there are over 1200 great slaughtering and packing plants associated with the big centralized markets. The business is thus spread out very widely instead of being held in the tight grip of a closely-knit group.

It is stated that municipally owned or controlled abattoirs are becoming more and more important factors in the meat handling business.

A factor that is tending to reduce the costs of marketing meat is the development of cooperative stock selling associations. It is stated that 715 of these associations now exist in 15 states, one-third of them in Minnesota alone. They bring better prices to the farmers, and therefore tend ultimately to help the consumer get lower prices; for whatever eliminates waste tends to accomplish both these ends.

FED IN YAKIMA.

Estimate 10,000 to 12,000 Head.

It is estimated by leading Yakima stockmen that from 10,000 to 12,000 head of steers are being fed in the valley this winter with an idea of finishing them on grass. Most of these steers are from outside points.

Federal Meat Inspection.

More animals were slaughtered under federal inspection during the last fiscal year than in any previous year since meat inspection was begun. The total for the 12 months reached 62,304,522 animals. Nearly 7,500,000,000 pounds of meat and meat food products were prepared and processed under inspection. Certificates were issued for the export of over 510,000,000 pounds of beef and beef products, more than 1,373,000,000 pounds of pork and pork products, and about 12,344,000 pounds of mutton, or a total of 1,895,863,936 pounds.

TO FATTEN CALF

Prize to Thirteen-Year-Old Boy.

In Iowa's baby beef feeding contest, in which more than 1100 boys and girls were enrolled, Clement Rowe, 13 years old, of Glenwood, Mills county, was pronounced winner and statewide champion. The contest was conducted by the Iowa Beef Producers' association in cooperation with the agricultural extension department at Ames. A $100 trip to Washington or a trophy of the same value, donated by the Union Stock Yards and Transit company of Chicago, is Rowe's reward.

STOCK EXHIBITS

By Baltimore & Ohio Railroad.

The traffic and commercial development department of the Baltimore and Ohio railroad has completed arrangements for a special train of live stock exhibits which will be shown in southern Indiana and Illinois, starting from Cincinnati February 5. Lectures will be given by experts at each shop for the benefit of farmers, stockmen and dairymen.

Brazilian Wool Exports.

Although the greater part of Brazil is somewhat tropically situated ever to become a producer of wool, wool is grown in the southern part of the republic, notably in the state of Rio Grande do Sul, where the climate is more suitable. The port of Rio Grande in that state is today the chief outlet for Brazilian wool. The total quantity exported in 1915 reached the sum of 997,630 pounds, valued at $193,065. The Brazil Land and Cattle Development company is said to have had very remarkable success in raising sheep of the Romney March breed near Morongaba, state of Parana. In the interior of the state of Minas Geraes a colony of Uruguayans has been having like success with sheep of the same type, but is apparently not yet exporting wool in appreciable quantity.

Pure Seed and Pure Bred Stock

Many Reasons Why It Pays to Carry on These Two Lines of Work

By J. R. SHINN, Spokane, Wn.

During a conference a few days ago in Spokane, when the matter of a live stock convention and also that of a pure seed convention came up, to be held in the city this winter, it was proposed that these two conventions should be held in connection with one another during the same week. Some one remarked that these two lines of farm work were so different, had nothing in common, so that two separate conventions had better be held and further consideration of the proposed convention was dropped for the time being.

After reading the following article by Mr. Shinn, the Spokane county agriculturist, there would seem to be good reason for holding the two conventions together.

Hand in Hand.

There are many reasons why the pure seed business and the purebred stock business go hand in hand, therefore the simultaneous development of the two should receive attention from those promoting these enterprises in the northwest. The time seems to be ripe for the development of each of these lines of work, and it is only fitting that we should look at the points in common of each. To this end, answer to several questions shall be made. Is the man who breeds purebred stock sufficiently impressed by his experience with the stock to realize the importance of purebred seed? Does the stock business carry with it any byproducts that are of special advantage to the seed business And, does the seed business carry with it any byproducts that are of special advantage to the stock business?

The Stock Breeder a Natural Seed Grower.

Experience has shown that no farmer appreciates the value of purebred seed more than the man who breeds purebred stock. These men appreciate to the fullest extent the value of the pedigree in securing the proper kind of offspring. They have found it true with their cattle, horses, hogs, or sheep, that to be sure of getting the qualities desired in the offspring they must know precisely from where this offspring has come for several generations prior to its advent to the world. In consequence of this knowledge of animal life, they are also careful to see that it is applied to the plant life as well. There are very few breeders of purebred stock but who have as a side line some specially selected potatoes, corn, peas, oats or barley that they are developing on their place. Therefore, it is not a hard matter to interest these parties in the development of pure seed along with the development of purebred live stock.

Makes Good Soil for Seed Growing.

Another point of very great importance in developing the seed business is to have well manured land on which to grow the seed. Plants can not be depended upon to develop to their highest state unless the land on which they grow is highly fertilized. No fertilizer works quite so well as that which comes in the manure furnished by the live stock business. Not only will it be found that a byproduct in the shape of manure is a great help in the seed business, but the fact that most live stock will prove of decided benefit in keeping down the weeds on farms for the seed business. This is especially true of sheep. No other live stock can take the place of sheep as weed eradicators, so that in these two results which spring from the live stock business, admirably fit this line of work to go hand in hand with the seed business.

Cheap Feed for Live Stock.

The third point which should be taken into consideration is a very decidedly important one, when it is considered that byproducts of the seed business may be depended upon to furnish cheap feeding for the growth and development of live stock. After the seed crop has been threshed, there always remain the threshings, or straw, which may or may not be of value to the farmer. The value of these threshings will depend upon the farmer's ability or inability to make use of them in feeding live stock. Where the pea business has been best developed it has been found that the hog business goes hand in hand. Peas can not be harvested without shattering a lot of them in the field. These peas will be a waste unless some kinds of stock are provided which are capable of picking them from the ground. Hogs act as gleaners in the pea fields, and convert shattered peas into useful and profitable feeding.

As a byproduct of the pea business there is also the pea threshings, which make excellent roughage for sheep and young cattle. This same thing is true where clover is used for seed purposes also. Farmers who make a specialty of growing clover for seed purposes find that the threshings which come from the crop have a great feeding value when used for roughage to feed to cattle or sheep. The same thing is true of the alfalfa seed business and of other crops grown commonly in the garden. Furthermore, in the fanning and the rejection of inferior seeds of all classes of crops there is left behind large quantities of material admirably adapted to feeding stock.

The Inland Empire must be depended upon to supply a greater amount of garden seed each season, and this will necessarily develop more threshings to be consumed upon our farms. The quality of the seeds produced here are of first rank, and seed dealers are coming to recognize this fact more and more each year.

In conclusion, it may be stated that the breeder of live stock, because of his knowledge of pedigree, generally furnishes the best farmer to develop pure seed on his place; that the by-products of the stock business found in the manure and the eradication of weeds by the animals make a specially fitting combination with the seed farm, and lastly that the by-products of the seed business furnishing cheap feed, either as grain or as roughage, make the proper development of the seed business especially desirable in connection with live stock.

Beats Out Humane Society

Don't take chances driving a lame horse. Read this man's experience:

"C. O. Brown, 340 Emerson Place, Youngstown, O., writes: 'I used Save-The-Horse for a splint; she was so dead lame 'Humane Society' would have had me arrested had they seen her. Veterinary said stop work and blister. Instead sent for Save-The-Horse. Never let her up. She was worked right through and no one ever saw her take a lame step.'"

LYON BLDG. SEATTLE.

Veterinary

Dr. S. B. Nelson

I have four dairy cows that came fresh about four months ago that have not come in heat as yet. These cows seemed to clean all right and look well and healthy. I have been washing them out with a 2 per cent solution of creolin for the last few days and they seem to have a whitish yellow discharge come from them a few hours after being washed out. I am feeding oat ensilage, some shorts and alfalfa hay.

C. C. D.

Auburn, Wash.

The fact that your cows do not come in heat would indicate that there is some ovarian disturbance. Just what that disturbance is I can not say. Possibly giving them a purge of one and one-half pounds of epsom salts in one gallon of warm water may bring about that condition. If after giving the purge menstruation does not occur I would recommend trying yohimbine in one grain doses once daily fer a few days. This is an expensive treatment, but it is reported as a very efficient one.

I have a cow five years old that freshened last October for the fourth time. After the second calf her udder got swollen and caked about every 10 days or two weeks for a couple of days. She dropped off on her milk to almost one-half and the milk was stringy. Then she would recover again to some extent, but does not give her usual amount. She is in good condition and eats well.

E. J. L.

Grandview, Wash.

Your cow is affected with mammitis or garget, and I would recommend that you give your cow one and a half pounds of Epsom salts in one gallon of water internally. Then inject into the caked part of the udder a quantity of 2 per cent solution of boracic acid. Dip the end of the teats into tincture of iodine before you make the injection. After the injection is made work the liquid about the udder to some extent and then milk it out. At the same time give her one ounce of fluid extract of poke root once daily for a few days.

What can I do for cats that have the distemper or something like it. It is very contagious as they all have it sooner or later. We have killed them and got new cats, but they get it too. They sneeze all the time with a discharge from the nose. Have given them pine tar, but it does no good.

L. R.

Wahkiacus, Wash.

Give your cats one-tenth of a grain of calomel once daily for a few days. At the same time give them from one-fourth to one-half of a grain of quinine in capsule morning and evening, the size of the dose depending on the size of the cat.

I have a sow that had six pigs, but five were born dead at different stages of growth. The sow was in pig when I got her. She had not been fed swill, but after I got her swill was all she got. Was the feed the cause of this?

W. F.

Lakeview, Wash.

Yes, I think your sow was not correctly fed. She should have had a fairly liberal grain diet of whichever grain or combination of grains you might have, wheat, oats, barley or peas. The swill might replace the roots of which a few would have been good for her. Alfalfa or clover hay makes a good roughage for her.

I have two cows giving milk and when separated it leaves a bloody substance in the separating cup. Both cows are in good condition and their first calf. One will be fresh in March.

E. N. P.

Prosser, Wash.

Try giving your cows each one teaspoonful of sodium hyposulphite in a pint of water once daily for a week. This has given splendid results in the hands of many dairymen.

Electricity Stops Heart.

Nearly all deaths from electricity are said to be due to the sudden stoppage of the heart, which is the organ most affected by heavy currents.

Get Bigger Profit From Your Live Stock

Run-down stock is never profitable. Further, it is a source of danger, since it is liable to contract disease and cause serious loss. Your horses, cattle, sheep and swine cannot do their best unless they are healthy and vigorous, every organ working efficiently and doing full duty.
To make them strong, vigorous, healthy and profitable use

Pratts Animal Regulator

America's original Guaranteed Stock Tonic and Conditioner which has stood the test of nearly fifty years. It will quickly tone up and invigorate the whole system, insuring more and better market products, stronger young, and greater ability to work.

This preparation contains the tonics, laxatives and blood purifiers which your stock needs now to overcome the bad effects caused by winter confinement, dry feed, etc. It will expel troublesome worms, too, and quickly put your stock in the best of condition. Test it at our risk. Our Guarantee protects you.

Our dealer in your town has instructions to supply you with Pratts Preparations under our square-deal guarantee—*"Your money back if YOU are not satisfied"*—the guarantee that has stood for nearly 50 years.

Breeds Again

Bird Question That Never Downs

By James Dryden.

The breed question never downs. The breed heresy persists. At the rate inquiries are made in regard to the "best breed" it seems the poultryman or would-be poultryman is looking for some magic breed to solve all his problems. He can not be blamed very much, for when he goes to the poultry show he encounters 100 different breeds and varieties, each breed and variety being the best in the world, according to the particular breeder with whom he talks. They are all the best layers, and the breed that has the best talker usually wins in impressing the visitor with its superior excellence.

The commercial poultryman—the man who is producing eggs or meat or both—will make no mistake if he considers no other breeds than the Plymouth Rock or Leghorn. The former will furnish both eggs and meat; the latter eggs. If he wishes the combination he should choose the Plymouth Rock; if he wants to specialize in eggs he should take the Leghorn. Any other difference in breeds is almost altogether a difference in breeding or strain.

But after he has decided on one of those breeds his troubles are not necessarily ended; rather they have just begun. The name Plymouth Rock means very little to him when it comes to egg production. The trouble comes in selecting within the breed the particular family or strain that excels Selection must not end with the breed; it must be applied unsparingly to the individual strain of the breed. The country must be hunted over for the particular strain that will produce the eggs most abundantly. The only sure way is to go to the man who has been honestly trapnesting his hens for the more years the better and carefully breeding from the best layers each year and make his selection there. He may be able to find better looking Plymouth Rocks elsewhere, he may find some that have won prizes in the show at the same price; but as it is eggs he wants he must buy fowls that have been bred for eggs.

In making his selection he must, of course, also choose those that show good vigor. He wants both vigor and heredity.

There are good layers among the Plymouth Rocks, and this is not incompatible with good meat qualities. It takes feed, however, to make meat, just as it takes feed to make eggs; so that it takes more to feed a Plymouth Rock than it does a Leghorn. For that reason the Leghorn should be chosen where eggs are the only consideration, because it will produce eggs at less cost than the Plymouth Rock, providing, of course, that they produce the same number.

World's Cork Supply.

Seventy per cent of the world's cork supply is said to be produced in Spain and Portugal.

Mexican Railways.

Mexico has 15,000 miles of railway.

Wheat Bran

Is Something More Than "Sawdust"

By James Dryden.

We don't yet know all about the real feeding value of bran, but to say that bran has little more feeding value than sawdust, as I have seen it stated, is stating something that is not warranted by a study of its composition nor by a knowledge of the results secured from it by poultry keepers everywhere.

Wheat bran is almost universally used as a poultry food. It is used more than any other byproduct of the cereals. For young chicks and growing stock as well as laying hens it is an excellent food. Its cheapness is probably the main reason for its popularity. But it is rich in protein also compared with whole wheat or corn. In 100 pounds of bran there are some 14 pounds of protein, while wheat contains a little less than 12 pounds, and protein is the most valuable part of the feed. On the other hand bran is not so well digested as the whole wheat. According to the best available data, about 72 per cent of the protein of bran is digestible, while 75 per cent of the wheat is digestible when fed to poultry. Even at this, bran has the advantage over whole wheat. That is, there is more digestible protein in a hundred pounds of bran than in a hundred pounds of wheat.

Considering it from another point of view, bran has a relatively high ash content. It is known that certain compounds of ash, such as phosphoric acid, sulphur and iron, have an important part to play in hen nutrition. Experiments have shown that corn which is low in mineral matter produced hogs that were undersized and fine in bone and over fat, "characterized by proportionately small kidneys, lungs, heart, liver and muscles and by a high percentage of fat." Animals may live longer with no food at all than with food containing no mineral matter, a German investigator has asserted. It has been shown that the laxative condition produced by the feeding of bran is due to the minerals in it, not to a mechanical action due to its bulk.

Best Display of Cornish Fowls.

R. A. Lee of Olympia was awarded the $12 prize in the Thurston County Poultry and Pet Stock show for the best display of Cornish fowls and he also won the governor's cup offered for the best 10 birds shown in the show.

Fruit for Australia.

At a recent national conference of the Australasian fruit growers, which was held in Melbourne, a motion brought forward by the New South Wales Fruit Growers' union asking for increased duty on fruit entering Australia was defeated, and it was voted that no alteration in the tariff was necessary. This will have an important effect on the sale of American apples, oranges, lemons, etc., which are now being imported into Australia in large quantities. A further motion directed the secretary of the conference to bring to the attention of the authorities in the United States the motion of the organization that "California be urged to admit Australia fruits generally from districts free from fruit fly or other diseases."

Less New Zealand Wheat.

Consul General Alfred A. Winslow reports from Auckland, New Zealand, under date of November 7, that according to the latest published government estimate the area to be sown in wheat for the 1916-17 season will be about 218,877 acres against 335,423 acres last year, and the area to be sown in oats is estimated at about 548,526 acres, against 640,227 acres last year.

Small Tracts

Tells Best Methods of Handling

At the farmers' short course, recently held in North Yakima, under the auspices of the Washington State college, Professor Thornber gave suggestions as to the best methods of handling 5, 10, 20 and 40-acre tracts under irrigation.

With a fice acre orchard he suggested as side lines, poultry, hothouse and raising early garden truck. With a 10-acre tract, combine with the orchard, poultry, potatoes and tomatoes, or poultry, alfalfa and potatoes or dairy cows, root crops and alfalfa. With a 20-acre tract, 10 acres should be in orchard and 10 acres charred ground for the production of crops not profitable to be grown in the orchards. With a 40-acre tract, which he considered the most profitable to handle, one-half should be in orchard, the other in crops, and practice crop rotation.

Irrigation and Fruit Buds.

Professor Thornber also spoke on the effect of irrigation on fruit buds. Fruit buds are developed from June to the blooming period the following year, and are steadily growing all the time. Fall watering has a great deal to do with your next year's crop.

An ideal condition is to have the soil moist from early spring until the 1st of August, then slightly check the growth by withholding the water for two or three weeks, then water strong even as late as the first of December.

The liability to winter kill from late watering is not as great as from allowing your trees to get too dry.

Pruning.

Thornber said we are going to the extreme in pruning. More fruit is lost by over pruning than by the codling moth. In fact the removal of diseased and broken limbs, badly crossed limbs and the removal of water sprouts is all the pruning ordinarily necessary and should not cost more than $2 or $3 per acre for 8-year-old trees. Pruning can be done at four different seasons of the year. During the winter time we prune for wood, early summer pruning gives a moderate amount of wood, summer pruning, with proper irrigation, induces fruit production, fall pruning has the same effect as winter pruning.

He advocated cover crops, alfalfa and reduction in irrigation as the better way to control excessive growth than by excessive pruning. Seeding to alfalfa has been found to be an absolute cure for little leaf or rosette.

Back State Road No. 8.

The commercial club of Bingen, Wash., is backing a movement to have state road No. 8, known as the North Bank highway, transferred from the second class to the first class and the appropriation made sufficient to grade the part between Bingen and Major Creek, six miles. The matter will be presented to the legislature. This road is the only state highway in Klickitat county.

Right Now!

You should lay the foundation for your future egg and poultry profits by feeding

LILLY'S

Holly **Chick Food**

High Protein **Chick Mash**

Poultrymen everywhere are feeding these excellent foods because they know them to be easily digested, palatable, pure and because they contain the right constituents for building healthy, sturdy chicks.

INCUBATORS AND BROODERS

The Pacific Coast Ideal,—most popular of all incubators, the best for the least price. Write and ask us about the MODEL coal-burning hover and the *International Sanitary* hover. We will gladly send Pamphlet describing these with prices.

Dealers sell LILLY'S Poultry Foods and Supplies.

Peace Note "Leak"?

Many Prominent Men Face Accusation

Something little short of sensational was sprung in the national capital last week when Representative Wood of Indiana, placed before the house rules committee a series of rumors and bits of hearsay information which he claimed indicated that certain prominent men had had inside information of the coming of President Wilson's recent peace note, and had made large sums of money dealing in stocks as a result. Among the names involved, but against which nothing but hearsay evidence was brought out by Representative Wood, were Joseph P. Tumulty, secretary to President Wilson, and a Mr. Bolling, brother of Mrs. Wilson. The reports were circulated in such a way as to cast suspicion on the White House administration, whether such reflection was intentional or not. Secretary Tumulty stoutly denied all the rumors that seemed to connect him with the alleged improper transaction, declaring that he knew absolutely nothing about the peace note until it was made public by President Wilson.

The charges made were to the effect that some one in close touch with President Wilson knew that his peace note was coming, passed the word to certain stock brokers and "friends" and with them conducted business on the stock exchange to their profit. It will be remembered that the stock market dropped phenomenally with the public announcement of the peace note.

Mexican Situation.

It is generally understood that the United States commission that has been in conference seeking a solution of the Mexican problem for the last several months is ready to admit its failure. Agreement with the Mexican government over the border troubles could not be reached, it is stated openly, and, while the commission has not yet formally ceased its efforts, it is felt that the situation is as far from settlement as at any time in the past.

Opinions differ as to what course the United States will pursue. The warfare still being waged by Villa and his adherents, uncontrolled by the Carranza soldiers, promises to bring about an acute situation at any time, and it is believed by many probable that President Wilson will be compelled to abandon his noninterference program and instruct the army to become active again toward the suppression of Villa operations. Others believe that the U. S. army, which has been in Mexico for many months, waiting orders to proceed or withdraw, will be withdrawn and the several factors in Mexico left to continue the struggle against each other.

Legislatures Convene.

The legislative season in the northwest is on. During the next several weeks the law making and law repealing bodies of Washington, Oregon and Idaho will be in session. The usual number of important matters are before them for consideration, though it is anticipated that the liquor question, which in the past has demanded so much attention in one form or another, will take a place of retirement, owing to the fact that all three states have tried prohibition and found it successful. Good roads will be one of the leading subjects for legislation in all three states. In the state of Washington, at least, the subject of constitutional revision will be acted upon, and it is not improbable that steps will be taken toward calling a constitutional convention to revise the entire document.

Peace Move Indorsed.

By a vote of nearly three to one the United States senate voted last week to indorse President Wilson's recent note to the warring nations of Europe suggesting that they state definitely the terms upon which they would be willing to make peace.

It is understood that President Wilson will not make any further moves toward peace until there are further developments.

That Germany is willing to state specifically her terms of peace is reported semi-officially, notwithstanding the emphatic note of England and her allies refusing to negotiate for peace at this time as proposed by Germany some time ago.

May Revise Tariff.

The federal treasury department is reported to be considering a restoration of tariff duties on certain leading commodities, including wool, coffee and rubber.

Salaries for Farmers

Widespread Interest Displayed in Plan

Since the announcement was made that this paper would pay salaries to farmers with rigs or saddle horses, scores of inquiries have been received. Many farmers are already at work for us and will be paid good salaries each month.

As there are still places open in many localities throughout the state we are repeating the details of our proposition.

We will not consider an applicant who does not live on a farm.

We want to hear only from those who will be willing to give our proposition a fair trial for at least a month and who will put in good hard licks for good pay. This work isn't easy; but you can do it and earn a good salary during the winter months, without neglecting your farm chores—without being away from home more than a few hours each day.

We give you full instructions and the right kind of help.

You will be able to earn a salary of from $25 to $150 per month or even more, dependent upon the amount of time and effort you can give to the work. Salary check will be sent promptly at the end of each month.

In writing us tell whether married or single, whether you own or rent your place and give the names of two merchants with whom you trade.

There isn't any red tape about our proposition, but we must know something about those workers we put on our payroll to receive a monthly salary check.

If we get two or more applications from one neighborhood, the first will be given the preference in making our appointment.

If you want a good salary proposition for the rest of the winter, don't wait till tomorrow to write us, but send your application today.

If not interested personally in the above proposition, why not get some neighbor or friend in touch with us at once who you think will appreciate an opportunity to make several hundred dollars during the winter months. You will be doing both him and us a favor.

Address your letter to Publisher The Washington Farmer, Review Building, Spokane, Wash.

"The Bull Gang with the Bull"

The Tractor That Increases Crops

HERE is one of hundreds of reports from farmers whose crops have been increased from 10% to 33 1-3% by the subsoiling feature of the Big Bull Tractor. (The bull wheel runs in the furrow and loosens the subsoil with its long spade lugs, 3 to 5 inches below plow depth.)

"The land plowed with the Bull Tractor yielded from 10% to 25% more. Our land has a tendency to form a plowsole in the bottom of the furrow and the drive wheel running in the furrow breaks this up. We are plowing 9 and 10 inches deep. We get into the corners of the field and finish as we can with horses and get as close to the fence as we can with a three-horse team. We are well pleased with our Big Bull. It is a dandy."—Charles S. English, Camas, Wash.

Burns Either Kerosene or Gasoline

The subsoiling feature is only one of many exclusive advantages you get in the "Big Bull."

Pruning

As to Right Time and Methods

By GRANVILLE LOWTHER.

A. F. Vystrcil of Boise, Idaho, writes desiring to know the best time to prune apple trees of the varieties, Delicious, King David and Rome Beauty.

I presume there is no better time to prune, than in the spring after the frost is out of the wood, and just before the sap rises. However, where the orchards are large, and the pruning period is necessarily long, some of the work must be done either late in the autumn or winter. We prune some of our trees and will continue to prune all winter except in the coldest weather. We do not like to prune when the wood is solidly frozen, because we think it does not so readily heal. But we have to choose between doing some of the work when we do not think it is the best time, or hiring it done by incompetent men in a rush season in the spring. We prefer to do it ourselves, and do some of it at a time we do not consider the best time. Of what we consider two evils, we choose the lesser.

Some orchardists prune heavily in summer. This is done to check wood growth and develop fruit spurs. Winter and spring pruning is done to shape the head of the tree, and to promote wood growth.

No two persons will prune alike, nor have the same ideals about the ends to be accomplished, so it is more difficult to give general rules for pruning than for almost any other kind of orchard work.

Rules for Pruning.

No two trees need exactly the same treatment. No two conditions are exactly alike. No two persons have exactly the same ideals as to what end is to be reached by the pruning process. It is therefore difficult to give satisfactory rules to be followed; in fact, nearly all the rules should be violated under certain circumstances, and the pruner must use his common sense. If he has not a reasonable stock of common sense, he should hire some one else to do the pruning. But if he does hire some one else, he will probably hire some one who knows less than he knows himself; but who thinks he knows it all. I like a man who knows enough to know that there are many things he does not know.

Pruner a Surgeon.

I would not like to be assigned to a hospital where the surgeon cut off my legs, arms and removed organs according to rule without deciding each particular case on its own merits. It might be that I have pure blood, that I live abstemiously, and that I have vigor enough to overcome a difficulty without an operation, which in another man would require most skilful surgery. Cutting off the limbs of trees is not as serious as cutting off legs and arms from human bodies, but in many respects it is the same philosophy. In other respects it differs.

To Be Kept or Broken.

With the preliminaries already cited, I am going to give the following rules, to be kept or broken, as the pruner thinks better.

1. Remove all dead branches. They are no good, and in the process of decay they are likely to infect the living branches, or the main body of the tree.

2. Remove all diseased branches, unless there is hope of restoring them to health. The disease may be communicated to other parts of the tree.

3. Where two branches interfere with one another, and one of them must be sacrificed, take out the less desirable of the two.

4. Remove branches that tend to give the tree an undesirable shape. You may want a spreading top, therefore remove branches that intertwine. You may want to cultivate close to the trees, with a large team, if so you will have to remove the lower overhanging limbs. You may want the fruit where it is easily picked; therefore remove the leaders that tend to make a high top.

5. Remove branches that pull the top in the wrong direction. If the prevailing winds are in a certain direction, and the top of the tree leans, the branches that tend to pull it in an undesirable direction might possibly be removed.

6. Prune during the dormant period for wood growth, in the summer for fruit spurs. I mean prune in summer to produce fruit spurs. The amateur may cut off fruit spurs, thinking they are small limbs. No man should be permitted to prune, unless he knows a fruit spur from a limb.

7. Cut the limb, as nearly to the body of the trunk or branch to which it is attached, as possible, for then the wound heals over more readily.

Must Supplement the Orchard

Professor Thornber of the State College of Washington tells apple conference that orchards must be supported systematically by variety of crops if they are to be dependably profitable.

This is the fifth of a series of articles summarizing the addresses and the discussions of orchard problems at the apple conference at Spokane during the ninth annual apple show.

Intelligent variation of crops supplementing the orchard in the northwest will: (1) Save thousands of acres to the fruit industry that will otherwise be destroyed; (2) maintain homes in rural communities that must otherwise be sacrificed; (3) develop a better and more permanent fruit industry; (4) provide reasonable income for light crop or low-priced years; (5) make possible the profitable use of much that is now absolute waste, and (6) provide labor the year-round for at least part of the orchard farm help.

This is the declaration, summarized, of Professor W. S. Thornber of the State College of Washington at the apple conference in Spokane in treating the subject, "Orchard Diversification."

Professor Thornber outlined and discussed cropping systems for four classes of orchards, the five-acre, 10-acre, 20-acre and 40-acre. Below is given his paper in part:

THE FIVE-ACRE ORCHARD.

Home grounds, one-half acre; orchard, four and a half acres.

Most profitable crops under ordinary conditions:

1—Poultry.
   (a) eggs, (b) meat, (c) chicks.
2—Head lettuce.
3—Rhubarb.
   (a) early spring trade, (b) cellar forced winter trade.
4—Tomatoes.
   (a) fresh trade, (b) canned goods.
5—Cantaloups.

Disadvantages of plan: No stock to consume pomace and cull fruit; no manure for fertilizing orchard.

Is Suggestive Only.

Not more than two of these crops should be attempted at one time. If poultry is made the chief line then it might be advantageous to attempt to grow only succulent food, alfalfa and root crops even might prove to be the most satisfactory.

Head lettuce is an exceptional crop and, while certain growers, under very favorable conditions have found it profitable, it is one of the crops that is naturally limited to small local areas and skilful management.

Rhubarb is one of the abused crops of most farms and is rarely made of financial importance. However, when properly cared for under certain conditions it becomes a fairly profitable crop.

Tomatoes are rapidly becoming more and more profitable each year when handled in good market condition.

Cantaloups only occasionally are profitable and should be attempted only in very favorable districts where good quality can be produced.

THE TEN-ACRE ORCHARD.

Home grounds, half acre; orchard, nine and a half acres.

Most profitable crops under ordinary conditions:

1—Poultry: a. eggs, b. meat, c. chicks.

2—Potatoes: a. seed, b. market, c. feed.

3—Root crops: a. sugar beets, b. carrots, c. mangels.

4 — Tomatoes: a. fresh trade, b. canned goods.

5—Alfalfa: a. hay, b. silage, c. pasture.

6—Dairy cows: a. sweet cream, b. sour cream, c. milk.

Good Combinations.

Advantages of Plan: Financial returns monthly, manure for fertilizing orchard, labor year around.

Upon 10 acres there is a much greater opportunity for live stock, particularly dairy cows, and while local conditions will very largely govern this factor, it has many advantages over numerous other crops.

A few growers who have had the opportunity to give the problem a fair trial report that, with carefully selected cows and good management, they are able to secure profitable returns. However, they feel that the unit should produce all of the succulent feed needed for the cows. They feel that while they can afford to buy chop they can not afford to buy hay and roots. The addition of dairy cows brings a big asset in the form of manure for fertilizing purposes.

Potatoes is one of the crops that averages well over a series of years but is not a profitable one-year crop. No grower should attempt this crop who must have big returns each year.

Root Crops Profitable.

Root crops likewise offer splendid returns where the labor problem can be handled. The successful growers have in many districts ceased to handthin their carrots and are thereby able to produce the maximum yields at minimum cost. Mangels are considered profitable feed crops and become a very important factor where live stock can be fed profitably. Sugar beets are frequently suggested as a splendid intercrop and when used for feed purposes are found to be profitable. The shade of the trees will influence the quantity of sugar content, and so it is not considered advisable to use sugar beets intended for sugar purposes as an orchard intercrop.

Alfalfa is one of the most satisfac-

tory crops grown in the orchard when cost of production, market and fertilizer value is considered. While it costs more to produce a ton of hay in the orchard than in the open, there is at market prices a profit in the crop and particularly so where it can be fed on the place.

THE TWENTY-ACRE ORCHARD.

Home grounds, one acre; clear, four acres; orchard, 15 acres.

Most profitable crops under ordinary conditions:

1.—Potatoes—(a) seed, (b) market, (c) feed.
2. Alfalfa—(a) hay, (b) silage, (c) pasture.
3. Root crops—(a) sugar beets, (b) carrots, (c) mangels.
4. Corn—(a) seed, (b) feed, (c) silage.
5. Canada peas—(a) seed, (b) to hog off.
6. Dairy cows, 10—(a) sweet cream, (b) sour cream, (c) milk.
7. Hogs—(a few).
8. Seed crops.

Good Combinations.

A—Alfalfa, corn, root crops, dairy cows.

B—Alfalfa, potatoes, Canada peas, root crops, hogs.

C—Alfalfa, corn, hogs, dairy cows.

Feed producable by combination A: 25 to 30 tons hay, 25 to 30 tons corn silage, 15 to 20 tons pomace, 25 to 35 tons roots.

Upon units of 20 acres or more there should be from four to 10 or even more acres of clear ground for the production of crops not profitably producable in the orchard.

If feed to be used as silage is desirable then a tall growing, heavy producing corn can be more profitably grown on clear land than in the orchard. If, however, it is desirable to produce seed corn, feed corn and some ensilage the more dwarf varieties will be found more adapted to the purpose.

Canada peas have been found to be an exceptionally profitable crop under many conditions in the orchard, especially where it is desirable to hog them off and save the cost of harvesting.

Under ordinary conditions it is easily possible to produce enough roughage for 10 cows on a 20-acre orchard diversification. A combination of this kind utilizes to the best advantage all of the byproducts and provides an at home market for much produce that would otherwise be wasted.

THE FORTY-ACRE ORCHARD.

Home grounds, 2 acres; clear, 10 acres; orchard, 28 acres.

Most profitable crops under ordinary conditions:

1. Potatoes—(a) seed, (b) market, (c) feed.
2. Alfalfa—(a) hay, (b) silage, (c) pasture.
3. Corn—(a) seed, (b) feed, (c) silage.
4. Canada peas—(a) seed, (b) to hog off.
5. Root crops—(a) sugar beets, (b) carrots, (c) mangels.
6. Dairy cows, 20—(a) sweet cream, (b) sour cream, (c) milk.
7. Hogs or sheep.
8. Seed crops.

Good Combinations.

A—Alfalfa, corn, root crops, dairy cows.

B—Potatoes, Canada peas, root crops, hogs or sheep.

Feed producable under combination A; 50 to 60 tons hay; 100 to 110 tons of corn silage, 25 to 35 tons roots, 20 to 25 tons pomace.

A plan of this kind carefully carried out in detail will provide an abundance of silage and hay feed for from 20 to 25 cows for the entire year. It will be necessary to buy only the grain feed.

It is understood that a grower will not attempt to diversify along the entire line of recommendations, but will confine has activities to a single line, making use of the various crops for the promotion of the main line of diversification.

British Root Crops.

The average yield of potatoes in England and Wales in 1916 is estimated at 5.85 tons per acre, or just one-third of a ton below the yield of 1915 and the 10 years' average; with a somewhat reduced acreage, the total production of two and a half million tons is about 350,000 tons less than last year, but only 180,000 tons below the average. Turnips and swedes have produced almost 13,000,000 tons, which is nearly 1,200,000 tons more than in 1915; the yield per acre (13.93 tons) is about one and a quarter tons more than in 1915, four-fifths of a ton above the average, and the best yield since 1910.

So Simple a Child Can Do It!—Add the Figures

One Father Writes:

"Please send me plan for your figure problem and include at least two of your figure charts. I wish to subscribe for the Farmer and at the same time give my little girl an opportunity at the addition of the Figure Problem.

CONTEST CLOSES MARCH 17, 1917

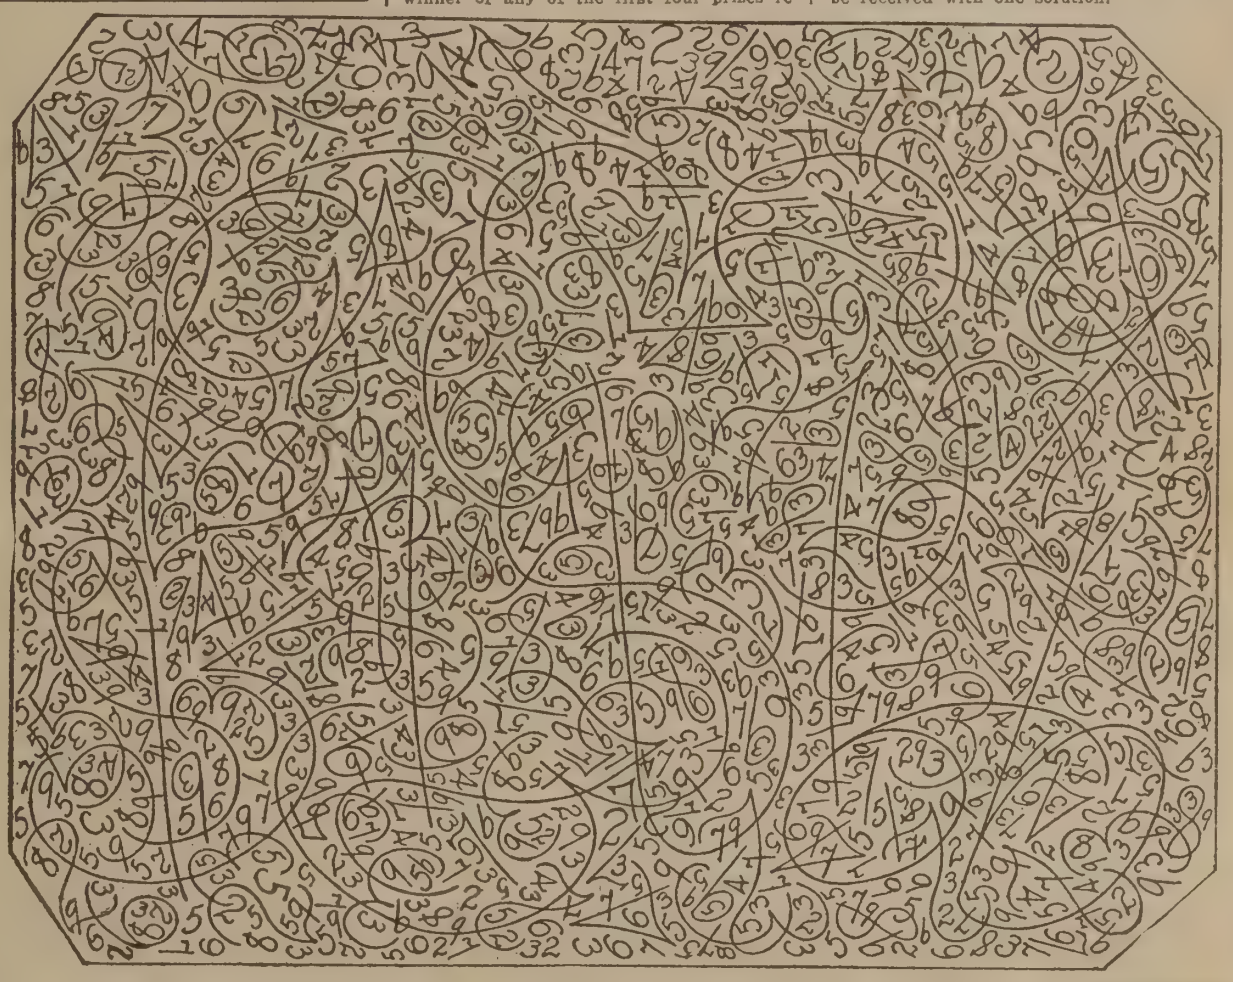
This Tells You Plan

Simply add up the figures in the puzzle chart as if they were in one long column. Your success depends on the accuracy of your total thus obtained.

Figures run from two to nine, and there are no double figures or characters which are not figures. The tail of the "6" has a decided curve, while the tail of the "9" is straight. All other figures have the usual characteristics, allowing no question as to the identity of any figure.

In event that no one submits the correct total, prizes will be awarded for the next nearest solutions.

This contest is restricted to persons residing in Washington, Idaho, Oregon and Montana.



A payment of $1 to $1.50 on subscription to the Farmer entitles the subscriber to enter the contest.

The money paid will be credited on subscription to the Farmer. The advantage of paying $2.50 instead of $1 is that the winner of any of the first four prizes receives additional prize dividends apportioned on the amount paid in on subscription, besides the fact that $1.50 during this contest pays for a three-year subscription to the paper, while $1 pays for only one year.

More than one solution may be submitter by any contestant, by an additional subscription payment of not less than $1 nor more than $1.50. It is not necessary to pay the same amount with each solution if more than one is submitted.

As many prizes will be reserved as there are people tied before any prizes are awarded to those sending in less correct solutions.

You can send in a subscription for some one other than yourself and have the solution registered in your own name. Remember that by paying $1.50 instead of $1 on subscription, the larger will be your dividends if you win one of the four leading prizes; but not more than $1.50 will be received with one solution.

$750-Prizes-$750

FIRST PRIZE, $200,
to which will be added 50 times the amount paid by the subscriber with the winning solution. For example, if you pay $1.50 on subscription, this prize will be worth $275.

SECOND PRIZE, $100,
to which will be added 30 times the amount paid by the subscriber with the winning solution. This prize may be worth $145.

THIRD PRIZE, $60,
to which will be added 20 times the amount paid by the subscriber with the winning solution. This prize may be worth $90.

FOURTH PRIZE, $50,
to which will be added 10 times the money paid by the subscriber with the winning solution. This prize may be worth $65.

FIFTH PRIZE, $40.

SIXTH AND SEVENTH PRIZES, Each $20.

EIGHTH TO SIXTEENTH PRIZES, Each $7.

SEVENTEENTH TO THIRTY-SECOND PRIZES, Each $2.

NOTICE—Solutions unaccompanied by cash payment on subscription will not be registered. Use registration blank on this page. Employes of this paper or members of their families are not eligible to enter this contest.

Review, Building, Spokane, Wash.

Bolivar Is Cracking

Famous Elephant, Stuffed, Is in Need of Doctor's Care

Bolivar, the mammoth elephant, whose mountainous form was a feast for eyes of young Philadelphians a decade ago, and who recently has been a main attraction at the Academy of Natural Sciences in the stuffed form, has showed signs of deterioration lately.

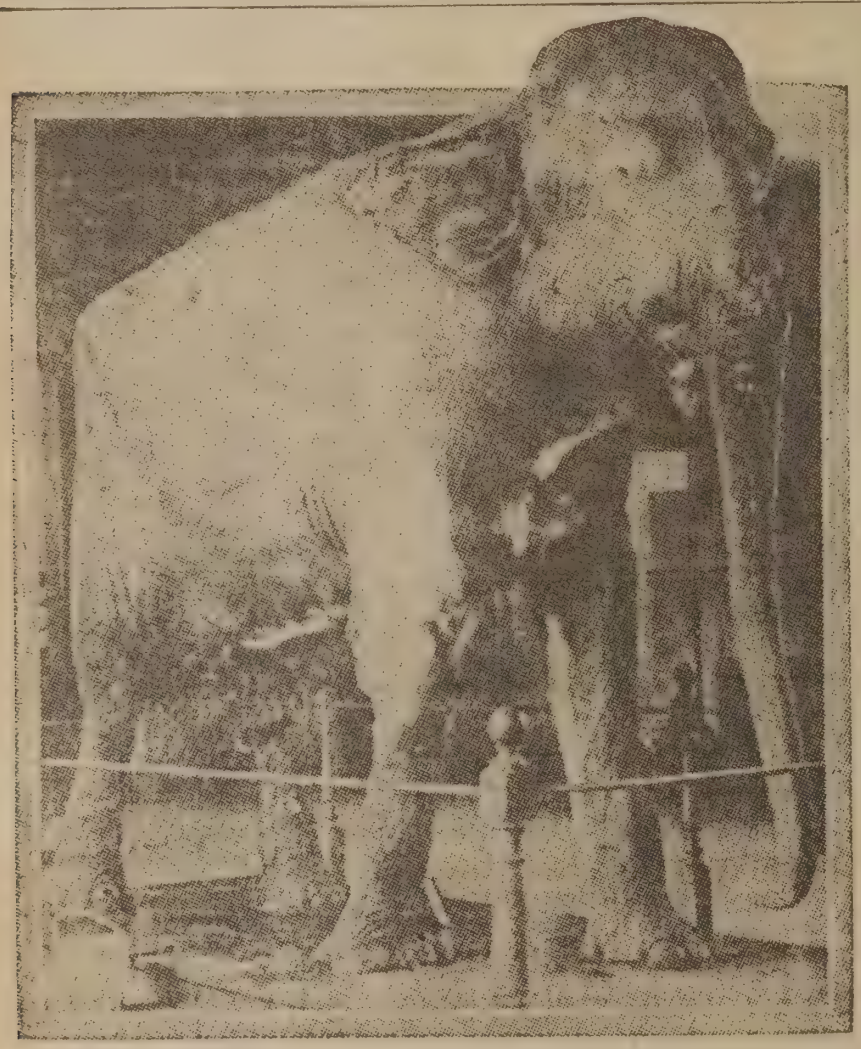
The thick skin, which stood Bolivar in good stead in many a jungle fight and could have resisted the leaden bullets of a hunter's gun, is now shrunken and cracked in many places.

David McCadden, taxidermist of the academy, has been working in an effort to forestall the ravages of time. Mr. McCadden believes he can patch up old Bolivar's form and make him presentable for several years to come.

Bolivar was presented to the Academy of Natural Sciences following his death in the zoological gardens in 1908. Mr. McCadden undertook the work of mounting the immense body in the summer of that year, and completed it in January, 1909.

Before the beast was cut up Mr. McCadden, who had recently introduced a new method in mounting animals, made accurate measurements of Bolivar's body. From these figures he constructed a plaster-of-paris cast, over which

He wandered the face of the globe as a feature of the Adam Forepaugh circus.



Adam Forepaugh bought Bolivar for $10,000 while his circus was playing in Europe. Bolivar came from India. He was widely advertised upon his arrival in this country. He was then about 40 years old.

One night Bolivar became agitated at his keeper and trampled him to death. After this he was not used in the ring, but he killed another keeper before Mr. Forepaugh decided to dispose of him. In 1888 he presented Bolivar to the zoological society.

Bolivar was placed in a big cage in the elephant house. His legs were manacled with heavy chains to prevent his roaming about. Keeper George Harrison is the only man who could go into his cage.

But Bolivar gave no evidence of his ferociousness to the hundreds who daily stopped in front of his cage. The sale of peanuts increased greatly with Bolivar's arrival at the zoo.

Gradually old age began to get in its work, and Bolivar became very quiet and morose. On July 31 he lay down and died. When brought to America Bolivar weighed close to seven tons,

Famous elephant at Academy of N atural Sciences gets doctor's care.

the elephant's skin was stretched. The result was a perfect likeness of Bolivar alive.

Bolivar has since stood in the main corridor of the academy, facing the main entrance on Race street. He has been subjected to many drafts throughout the changing seasons, and this has been one of the causes for the breaking up of the skin.

Sections of the right foreleg, the under part of the neck and a large space on the forehead have suffered most. One large hole, 10 inches square, has opened under the neck. The breaking of the skin on the forehead is due to Bolivar's having rubbed this section of his body against the massive iron bars at the zoo, causing a bad sore to develop there.

Bolivar. The name electrified boys and girls 15 years ago. Bolivar, the largest elephant that was ever in captivity. Everybody wanted to see him.

but at his death his weight was said to be little more than five tons.

"I think I will have the old boy in a presentable condition in a few days," declared Mr. McCadden, as he jammed a fistful of soft cement into Bolivar's mouth, a thing the huge beast would have resented in former years by picking up Mr. McCadden and hurling him half a block.—Philadelphia Ledger.

Alaskan Dogs.

Last winter the French authorities imported from Alaska and Canada several hundred trained dogs for drawing sleds in the Vosges mountains. They proved so useful that they have been employed during the summer in similar work, though they now draw the sleds on small railways. Eleven dogs with a couple of men can haul a load of a ton up some of the most precipitous slopes in the mountains. The Alaskan dog is the best, it is said. His courage never fails, and he will work till he drops.

Down and Out

Now He Is Working Like a Man

By D. G. SUTHERLAND.

At a hotel in Yakima valley where I was stopping late one evening a stranger came in. The night clerk stepped up and asked if he wanted a room. The reply was, "Yes, but I haven't the price. I am cold, would you mind if I sit in here where it is warm." He was told to take a seat. After all the guests had retired the clerk engaged him in a conversation.

"How long have you been here?"

"Came in tonight in a side-door palace."

"What have you been doing?"

"Oh, just anything I can get to do. It seems hard for me to get work. I am kind of down and out and no one wants me. It wasn't always that way, though. Until two years ago I always had plenty of work. I have a good trade, speak two languages and was always in demand, but business got slack and with a bunch of others was laid off. I was in Tacoma at the time and it was winter time when men were plenty and jobs were scarce. I tried every place for nearly three months, but could get no work. My savings were getting low and my family were disgusted with me. They said I could get work if I would only try and if I didn't do something they would leave me. I told them it was not necessary, that they could have what we had and I would step out. I have got a little work here and there, but haven't had a steady job since. It don't make much difference as no one cares whether I live or die."

The clerk said, "Do you know why you can't get a job? It is because you are dirty, slovenly, have no pride or confidence in yourself. Nobody wants to hire a man looking like you do. Have you any clean clothes and a razor?"

"Yes."

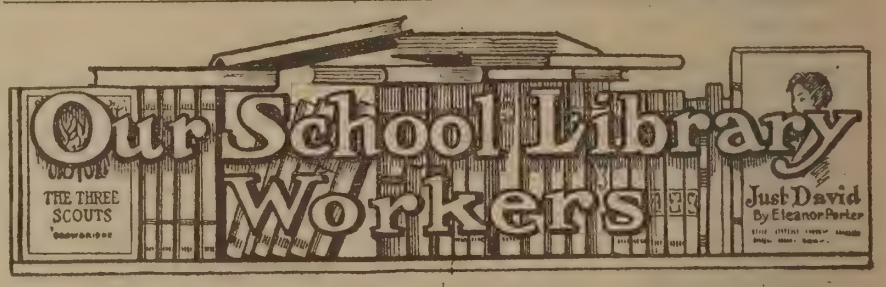
"Well what you need first is a bath, a shave and some clean clothes. Here are towels and a cake of soap. Get into that bath tub and scrub yourself as you never scrubbed before."

He did and the change was miraculous.

"Now here is a quarter, get something to eat. You are an Eagle in good standing. Go down to such a store. The proprietor is an Eagle and he knows people who need help. When you go in look him square in the eye, tell him who you are, that you want any kind of work at any price, that all you want is a chance to make good and say it like you meant it and you are sure of a job. When your day's work is over don't spend your evenings with a bunch of hobos in some low dive; come to the hotel, it is warm and we have daily papers and good people to associate with. You are welcome as long as you are clean and sober."

He took the advice, got a job the next day and has had steady work ever since. About two weeks later he asked the clerk for some writing paper and an envelope, and said he was going to write home, a thing he had not done for two years.

A few nights ago he confided in the clerk that he was hearing from home. They wanted him to come back and his brother said there was plenty of work and he could get him a job at his trade.



He said, "I am going, but I am going to make a stake here first."

Avoid Orphan Asylums.

Australia avoids orphan asylums by sending parentless children to private families, which are paid for their care until they are 14 years old.

Education.

After getting an education it is up to a young man to do things with the knowledge he acquires.

One of the most pleasing things connected with our school library work is an occasional personal visit from some of our teacher friends. It gives us an opportunity to get the teacher's viewpoint, which is valuable to us; and it permits the teacher to form a closer acquaintance with our work and ourselves.

Miss Florence Woodward, teacher of West Deep Creek school at Espanola, Wash., came in last week and brought enough subscriptions to more than half win a library. She also brought a big lot of good, fresh ideas and a most pleasing personality. Miss Woodward is very much alive and very enthusiastic toward her school work. And she is certainly determined to have one of our libraries in her school. She tells us that team spirit between the Reds and Blues is mighty keen—one team being in the lead one day, the other team the next day. Miss Woodward says this competition between her pupils is the best thing imaginable to keep up lively interest in all other departments of her school work.

We cordially invite all teachers to come in and have a chat with us whenever they come to Spokane.

How's this for a bit of encouragement to schools that are after libraries? During this week a number of subscriptions were brought into the office by subscribers in person who asked that their subscriptions be credited toward a library for some school.

This is the best kind of proof that though a subscription may be withheld today, it may come to you tomorrow either directly or through the office. So see everybody you can and the subscriptions for the library will surely come.

Hopewell school, at Everson, Wash., is still hammering away. Mrs. Clara Peterson is teacher and is keeping her contest moving right along. One of her hard workers is Millar Prariea, whose names appears again on this week's honor roll.

Narcisse school, at Colville, Wash., is doing nicely, too. Doris Sholund and Florence Stevens are apparently taking advantage of the holidays to add more subscriptions for that library. These girls are making the most of every opportunity—a good example which other live library workers will be sure to follow. Mrs. G. C. Lorenz is teacher at Narcisse school.

Miss Hattie Irons, teacher of Bay View school, Bayview, Wash., tells us in a nice, friendly letter that her pupils and herself have been so very busy with their holiday programs that, much as they want a library, they haven't been able as yet to get their contest into swing. Miss Irons' letter makes it clear, however, that Bay View school will soon be piling up subscriptions for a library, and with the best of the reading season just coming in the subscriptions will be easier to get and the library all the more enjoyable when won.

THIS WEEK'S HONOR ROLL.

West Deep Creek school—Mildred Abern, Vern Stevenson, Fay Lavender, Oscar Schulz, Robert McDonnell.

Narcisse school—Doris Sholund, Florence Stevens.

Hopewell school—Millard Prariea.

All the World's a Stage, and All the Men and Women Merely Players

Is a Viscountess.

In accordance with custom when there is a change in the government, the king has conferred honors on various persons recommended to him by the retiring prime minister, among them Sir Lewis Vernon Harcourt, who is made a viscount. His wife was Mary Ethel Burns of New York. Mrs. Lewis Vernon Harcourt, eldest daughter of the Walter H. Burns, and favorite niece of the late J. Pierpont Morgan, is one of the most popular leaders in Anglo-American society. Her mother was a sister of Mr. Morgan and her father for many years was head of the banking house of J. S. Morgan & Co. in London. Her marriage to the son of Sir William Vernon Harcourt at Westminster in 1899 was one of the most brilliant society events in London. Mrs. Harcourt had the honor of being the first hostess to entertain the prince of Wales when, in 1912, he was a guest at the Harcourt country house near Oxford. She is a close friend of Queen Mother Alexandra.

Give Millions to War Relief

Millions of dollars have been raised in the last few days for the relief of Jewish sufferers in Europe from the effects of the war. It is planned to raise $10,000,000 altogether, and already more than $3,000,000 has been contributed. Among the largest single contributors were Jacob H. Schiff and Julius Rosenwald, who gave $100,000 each; Nathan Straus and Felix M. Warburg both sent checks for $50,000.

His Master Will Not Return

—(Photo from Underwood & Underwood, New York.)

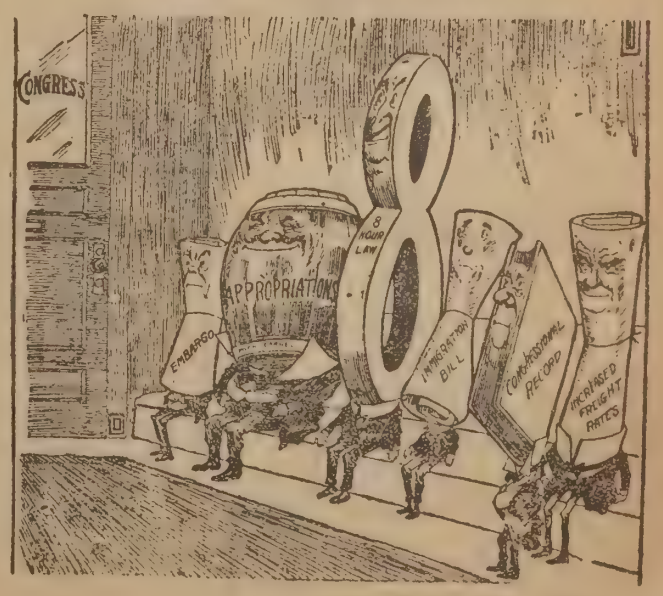
This British official photograph shows a pathetic scene on the La Basse front. A handsome horse, the mount of a British officer, is standing at the edge of a dugout, where the British officer has gone, never to return. An unfamiliar hand will lead him away from the scene of his master's death. Many animals have been known to pine away in sorrow for their masters.

May Lose Morgan $400,000

Mrs. Yuki Kato Morgan, the Japanese widow of George D. Morgan, may not get the $400,000 fund which her husband left her when he died. The trustees of his estate have asked the courts to decide whether the terms should be carried out or whether the fund should be divided between the decedent's brother, Junius, and his sister, Caroline, explaining that Morgan received the fund in a trust left by his father to him, his sister and his brother.

President of Standard Oil

Alfred Coffin Bedford has been elected president of the Standard Oil company to fill the position left vacant by the death of the late John D. Archbold. It is said that in promoting him from the vice presidency the directors followed their own inclinations and the express desire of Mr. Archbold. The new president is 52 years old. He worked his way up from the very humblest sort of a position with one of the Standard Oil subsidiaries.



Rejected by U. S.; Bought by British.

Copyrighted by International Film Service.

This photograph shows United States army officers inspecting the famous Lewis machine gun. This gun was offered to the United States and rejected and afterward purchased for the British and Canadian armies. Secretary of War Baker, assuming full responsibility for the action of the war department in rejecting the gun, directs that the controversy among army officers, led by General Wood on one side and General Crozier, chief of ordnance, on the other, shall cease.

Waiting Their Turn

New York Evening Telegram.

NORAH

By

Gilbert Parker

From "Queen Mary's Gift Book."

It was as fine a churchful as you ever clapt an eye on;
Oh, the bells was ringin' gaily, and the sun was shinin' free;
There was singers, there was clargy— "Bless you both," says Father Tryon—
They was weddin' Mary Callaghan and me.

There was gatherin' of women, there was hush upon the stairway,
There was whisperin' and smilin,' but it was no place for me;
A little ship was comin' into harbour through the fairway—
It belongs to Mary Callaghan and me.

Shure, the longest day has endin', and the wildest storm has fallin'—
There's a young gossoon in yander, and he sits upon my knee;
There's a churchful for the christenin'—do you hear the imp a-callin'?
He's the pride of Mary Callaghan and me!

I.

It was a voice worth hearing, and the man was worth seeing, as, standing in a large paddock in front of a house, which for the prairie-country was a large one, he drove the colt he was breaking round a circle, at the end of a long leather rein. He had in his face the look of one who had lived life in more ways than one, and his shoulders had the straightness of one who had known the "Shun!" of the drill-sergeant, though he was over 40 years of age. In this perfect sunlight, with the gold-brown stubble of the reaped land stretching for scores of miles away, he seemed the true representative of a life of energy and happiness. His face was ruddy, his eye bright; but his hat, which usually was set back on his head, was now drawn forward. He seemed to keep his face turned towards the big clap-board house, outside which stood a buggy with a pair of horses.

Despite the lilt of the song, the air of triumph in it, the elation of the body engaged in a task suggestive of the pioneer-life—its roughness, its awkwardness, its undisciplined capacity, and its rugged, careless beauty, there was a curious watchfulness in the eyes, a smile of emotional expectancy at the lips—in a woman it would be called wistfulness. Indeed, there was something wistful in him, too, strong man as he was. He was Irish, and the magic of imagination, with its accompanying sadness, lying behind all mirth and playfulness, was his. Yet he was an incorrigible optimist.

There was a time when he had been an incorrigible idler, a stoic—a thoroughly useless man. Those were the days when, having stepped into old Larry Brennan's house out of the rain, he had stayed 10 years doing nothing, till a tragedy had roused him, brought him to his senses, set him upon the high road of energy, action apd success. Behind him, too, had been Norah Brennan and the young doctor—Norah, with such fine teeth in her head, though older than he when he married her, and the young doctor, with a pungent humor and good sense, which had stimulated and spurred him on.

Norah had not been his first love, but it seemed as though she would be his last one, for he had never looked right or left since he married her. The same old loyalty which had made him cling to the memory of the girl who threw him over long since at Enniskillen, in old Ireland, still made him weave round Norah's head a halo of beauty—one of the blessings of imagination, for Norah was no rose of Sharon.

Five years had gone since he had started the stage coach from Askatoon to Cowrie, and began to breed and deal in horses; and the world had gone very well with him. He and the young doctor were partners in the horse trading, and they had had as much fun as money out of the business.

He was thinking of the young doctor now, wondering why he did not come, protesting inwardly against the miserable delay, seething inwardly, though there was music on his tongue and a lilt to his voice. Round and round went the colt, growing more and more docile under the firm, quiet control of a born master of animals. Would the young doctor never come?

"There was gatherin' of women, there
was hush upon the stairway,
There was whisperin' and smilin',
but it was no place for me;
A little ship was comin' into horbor
through the fairway—
It belongs to Mary Callaghan and
me."

He had sung the verses over and over again—a dozen in all. It was like an obsession, and he was hardly aware of his own persistence—

"He's the pride of Mary Callaghan and me!"

Five years since his own wedding with Norah, and no child—he had not realized when he married that it would be a miracle if a child came to them. In truth, he had not thought at all about that. They had gone through so much together in the days of tragedy, that being man and wife was the only thought in his mind when they went to the altar. But, with marriage, had come the other instinct, and he had dwelt much upon it. He wanted a child as the hart desires the water springs; and Norah, knowing what was in his mind, willed it so with a will that was pathetic; for something, too, had been born in her which was not there before.

Marriage had made her see life with new eyes, and she had discovered many things hidden over 40 years. Perhaps it was her great will and stubborn purpose which had at last wrung from the great creating force assent to her diligent prayers, so that she was able to whisper something worth hearing into Nolan's ears one winter night, when the frost and ice outside were like a shrine for the warmth in their inflammable Irish souls.

Then the months of patient waiting had gone, with Nolan driving his four-horse—in the gaiety of his heart sometimes his six-horse—team, with his great red stage, and the coaching horn defying the distant railway with shrill bravery, and receiving the shy congratulations of women folk, and a hearty "Good luck to ye!" from men on every hand. He had become a figure in the west; and, having his millionaire brother-in-law, Terry Brennan, behind him, like a sounding board, his fame, of its kind, was loud and reached far.

There had been many bets as to whether Norah would fulfil the natural hope of man, and when the time came the prairie people were wide-eyed with interest—for Noah was over 40.

The day had arrived. Would the young doctor never come out of that clapboard house which soaked the sun like a sponge, and yet was cooled within by the fresh breezes from the prairie? Was the young doctor bungling the business? was he——?

A man's figure appeared in the doorway, stood for an instant, with head bent and eyes upon the ground, as though to consider something; then there was a quick step to where Nolan stood with the sweating high-bred colt, which he had mastered.

As the young doctor came nearer, Nolan's eyes searched his face, then, with a puzzled look, he turned to the colt. "Steady, now, ye bunch o' beauty!" he said. "We'll start ye soon. The trail's waitin' for ye."

"Nolan Doyle," said the young doctor, who understood the assumed indifference—that smooth, outer mask which holds the rough inner pain—"Nolan, you're wanted now."

"Did ye iver see a finer day!" said Nolan, not able to look the young doctor in the eyes, for he knew that trouble of some dark kind was come.

"Norah'll be glad it's a day like this—'Happy is the birth that the sun shines on,' happy are the dead that the rain rains on," he added; but his fingers trembled on the rein he held, as he quickly drew the colt nearer. "Ah, what is it, doctor, dear?" he suddenly burst out, with a note of agony in his voice. "Speak—what is it? Is all well? Is it over?"

The young doctor shook his head in negation and ruled his face to calmness.

"Then, what is it? Why are ye here? Doesn't she need you? Is it a thing to be done by any but you?"

"Be still, be still, Nolan," answered the other. "Keep a hand on yourself. You want a child—you want a child, I know——" he paused.

"God knows. What's to it all without a child? What should I be workin' for if it wasn't for a child? Well, then, the child, is it here?" he asked painfully.

"'Tis not here. She was no lass of 20. 'Tis not here." The young doctor came nearer and laid a hand on Nolan's arm. "Steady now, and choose which it shall be—mother or child. It can't be both. I can save one or the other, not both. Which shall it be? She was no lass. Which shall it be? 'Tis for you to say."

The young doctor's words fell like the roar of a waterfall on his ears—"Which shall it me—mother or child? It can't be both."

Was this, then the end—Norah or Norah's child? How greatly he had longed for "the little imp," as he had sung but now! How had he thought always of a little lad, with hand in his, riding on the box beside him! How had the soul of him rung with the note of fatherhood!

"If it's she that's to stay, there could never be another child," said the young doctor.

"Never another, if it's she that's to stay," Nolan murmured, as though hardly grasping the tragic significance of the fact. Yet his face was white and his eyes were dark with misery.

"You must say—now. There's no time. Is it to be the one you've not seen—or Norah?"

"What's that you're askin' me?" was the low, fierce reply. "God! don't you know? Go on, go on, and tell Norah that she's not to fret that it couldn't be. Go on—to Norah, man," he added, with a wild look in his eyes.

With swift steps the young doctor disappeared into the dark coolness of the house, leaving behind him the last bopes of a man whom he had helped in other days to set upon his feet and start again in life. "You couldn't be sure," he said to himself, as he entered the room where Norah struggled in that sea where man only stands upon the shore and watches till the storm goes down.

Heedless of the colt, which now ran about with the long rein trailing after it till a stable boy, seeing, made it captive, Nolan sat upon the corner of a water trough and looked at the house with eyes that saw only as through a dim gray atmosphere which stifled the brain and sense. Norah or the child! Did the young doctor believe him, then, the kind of man that* * *! But the thought of the little life that was his, his very own, which he had hoped to cheer him on, and make him work, and give him an end to aim at—it caught at his throat. And soon that little life would be lost, before the eyes had seen the sun, before the hands had reached out into the light of the world, before is voice had signalled back from sentient existence to the dim seas of being whence it had come, that it had found the shore.

In elementary understanding, he saw it all by virtue of the Celtic strain in him; and his brain swam on a flood of new impressions. He had leapt over vast spaces of life and experience in these few moments. How long he sat murmuring to himself, speaking Norah's name, bidding her not to mind—there were always the horses left!—he could not have told; but at last a woman came running from the house to-

Nolan sat upon the corner of a water trough.

ward him. She was fat and scant of breath, and ere she reached him had no voice. Words failing her, she could only beckon to him.

"Is she safe?" he asked in a hoarse voice. Why should women be fat and scant of breath?

The woman nodded.

"Was it a boy?" he asked.

"Ah, a wonderful boy!" she said, "with a body like—like a young colt," she added, seeing the young blooded horse led away.

"And the face of him?" he inquired anxiously.

The woman turned her head away. He understood. Life took its tribute through death, and, with a harsh hand, had destroyed its own.

"Norah is asking for you," the woman said. "There never was a braver. Ah, but there's a heart for you! No man deserves it. She would have gone and left the boy alive to you, if she'd known. She sez so. No man's worth it, that's my idee. But it wasn't to be, and it was flying in the face of Providence. But she did her best, poor dearie."

Nolan did not answer her, but he could have throttled her for the truths she had uttered.

Inside the darkened room a few moments later, he turned away from the little lost life which a woman made ready for its return to the nest of earth whence it had come. He bent over Norah's bed again.

"You're a fine woman, Norah," he said—"the very finest. Come, now, smile at me," he urged. "We've a long way to go together yet. Smile, Norah, girl. You're mack again from the Bad Lands. Smile!"

With clouded eyes, Norah faintly smiled.

"You've a fine tooth in your head, Norah," he exclaimed—"as good as one that's 20. I've broke the Inniskillen colt—a beauty," he added. "I'll bring him to your window tomorrow. You shall ride him nevt year. I'll give him to you. It's the best that's come from Queen of the Isles, tho' she's had 20. There now, kape aisy."

"Can ye forgive me then, Nolan?" she asked brokenly. "Lord knows I ought to have wint instead. You'll want some one by you as the years go on—some one, somethin' to live for."

"Sure, you'll be by me, Norah."

"Come away," said the young doctor. "She must be left alone."

As Nolan left the room, he said again, "I'll bring the young colt to your window tomorrow."

Her eyes searched the room for what she had lost.

II.

In vain. Norah had no comfort in the high-bred colt, no content in thinking that her own life had been spared. It seemed to her that, in spite of Nolan's cheery ways and whimsical talk and busy life, at the back of his eyes was a reproach; that in the tones of his voice was scorn of her, because she had failed to prove herself as good as any woman.

Norah never could realize, never had looked the fact in the face, that she was no longer a slip of a girl. Didn't her father and mother in the cottage under the Rise, whom she and Nolan, before they were married, had nursed back to life, and by which Nolan had paid the price of his 10 years living on them—didn't they always treat her as a child almost? Had not the young doctor always addressed her as "Nolan's girl"? Hadn't he always said, "And how is Nolan's girl today, Mrs. Doyle?" Who had a better right to be so familiar with her? And Nolan himself, night

"Nolan Doyle," said the young doctor.

A woman came running from the house.

2nd morning, wasn't it always, "Honey girl," and "Me child"?

How could she remember her age and the passing years? Her waist was little bigger than at 20, and her hair hung down to her knees. The wrinkles, did they not come from laughing at Nolan's jokes and her brother Shannon's whimsies? Did she not step as light as any lass that tripped to school? How could she remember her age? Yet in her heart of hearts there was no illusion.

There was a tiny grave just over the Rise, where an ash tree stood like a sentinel in the gold-brown prairie. Its top could be seen from the window of the great living-room, and her eyes were ever looking that way, while Nolan's head was ever turned from it. Or, if his eyes fell on the tree, a look came into them as though a veil were drawn over his sight.

He talked faster and bustled more at such times, making a fuss at whatever he might be doing at the moment—lighting his pipe, sharpening the carving knife, or mending a piece of harness. He never walked in that direction, if he could help it; but Norah stole away over the Rise to the whispering ash, every day in summer except a Sunday, when he was away with his stage-coach, or at a horse-fair, or buying or selling or training.

"Shure, 'tis not natural," said her father to her one bright, cold winter day, at the old man's cottage under the Rise; "'tis blasphemy to take on so, when it was the Lord's doin'. And it never lived at all—'twas held back from livin' by the hand o' God. Can't ye see? Are ye no Christian; are ye no philosopher, little girl?"

"I have no brains," she answered. "'Tis not what I was made for, studyin' out why this was done or wasn't. 'Tis enough to know 'twas done, an' what's come of its bein' done."

"And what's come of its bein' done, then—tell me that?" asked her mother,

"Smile, Norah, girl. You're back again from the Bad Lands. Smile!"

feebly lifting a cup of tea to her wrinkled mouth.

"Ah, what's come of it! Isn't he atin' his heart out—Nolan?"

"'Tis only your fancy. There never was a bolder tongue and a better man at table."

"Haven't I heard him singin'? 'Twas like a knife in me. Haven't I heard him talkin' in his sleep? 'Come on, then, me little lad. Up on the box wid ye!' and that kind of thing, he'd say. He's dreamin' now that never dreamt before out loud like that. 'Tisn't brains ye need to know truth. 'Tis a true heart and the quick ear of one that's got it."

"What was the song he sings that struck ye so?" asked her father. Her eyes took on a strange look as she recited Nolan's song:

"Sure, the longest day has endin', and
the wildest storm has fallin'—
There's a young gossoon in yander,
and he sits upon my knee;
There's a churchful for the christenin'
—do you hear the imp a-callin'?
He's the pride of Mary Callaghan and
me!"

"It's like a man singin' to hide his shame," she added.

"What's that ye're sayin', Norah?" asked her mother. "What's the shame y'are speakin' of, then?"

With a sharp cry Norah stretched out her hands. The barriers that clouded her view of the exact truth had broken down. She saw the whole elementary facts in one revealing moment.

"Oh, shame it is to him that he's denied what is the pride of man," she said. "I know—ah, shure, I know! I oughtn't to have married him. I made him do it—I made him. I drew him into it. 'Twas at the bedside of the two of ye that he ate the dish I made for him. I was never a wife for him—he that ought to have had a girl of twenty."

The true facts had possessed her at last. She saw herself, her vanity, her obtuseness, her self-deceit, her deception to him, laid bare.

"I'm older than him—I'm older," she went on. "I'm an old woman. I never was a wife for him, and he knows it, and he knew it from the first. And I couldn't carry it through with all my willin' and fightin'—'twas no matter for prayin' that, but just flyin' in the face of Providence. But the willin' and the fightin' come to nothin'; and now he's off, he's off to one that's twenty. He's gone to one that's what I was long since, with hair like a sheaf of wheat in the sun, and the rest of her——"

Her hands dropped in despair, she sat down helplessly, and rocked backwards and forwards in her misery.

"Who's that you're speakin' of?" said her father, with a furtive glance of understanding to her mother and a quick nod of comprehension. "Who's that with the harvest hair, and the rest of her——"

"A harvest for reapin'!" Norah broke in, with a passionate gesture.

"Hush, for shame on ye!" spoke her mother. "Have ye no price? The man's yours, and he knows he's yours; and what's to fear, I want to know?"

Norah gave a bitter laugh. "D'ye think all men are like your own husband?" she asked harshly. "Nolan's turned from me to her."

The old man got up and came over to her. "Who is she? Where does she live? Where does he see her, Norah girl?" he asked.

She sprang to her feet. "Don't call me girl again!" she cried. "I'm none o' that. I ought to have stayed with you. Shure, me spring was long since done. Me summer is that far gone, 'tis but a memory, and me winter's here. And it's cold—God knows it's cold!" she said drearily.

"Who is she?" urged her mother.

"'Tis the sister of Jacques Charron, that keeps the tavern at Pardon's Drive. Nolan passes every day. He never misses a day with his stage-coach now—one day in going, and one day in coming, and the long night between."

"Peace, woman!" said her father sharply. "Are ye mad?"

"Who's that you're speaking of?" said her father.

"Last night, in his sleep, he said her name. And today he's gone to her. 'Tis not the stage day. He sent Shannon with the stage yesterday. But he couldn't stay away, so he's gone to her."

She turned toward the window, and watched the first flurries of a snowstorm coming over the prairie. "Ah, wurra, wurra! I feel that I'd like the storm comin' there to swallow him up; and me with him—and me with him! There'd be peace if the storm would swallow us up together."

"Poor lad! that would be hard on him," said the old man dryly, "if so be it's true that ye made him marry ye."

"'Twas his duty to stay true," said the old woman. "There was the marriage lines."

"Can ye rule the blood by lines on a paper?" said Norah, with a voice so cheerless that her father sat down by her and stroked her hand.

"I heard something about it," he said gently, "and I spoke to the young doctor about it; but he said, 'Lave be,' he said. "Twill work itself out. The Charron girl yonder's a good girl, but only likin' to be noticed by a handsome man. Lave be, and he'll right himself,' he said. 'If he doesn't, ye can't cure it by interferin'"—that's what he said; and he's a man that's got more sinse than you or me, or any of us."

Norah rose. "Yes, we'll lave be," she said. "What's the good of not lavin' it be? If I kill him I've lost him just as sure as if he wint with the girl. I've thought of killin' us both," she added, with a quiet glitter of her eyes, "but he'd leave me in Hell just the same if I did. But if the storm would do it—ay, if the storm would do it—together——"

The drifts of snow softly rising in

Where an ash tree stood.

the distance seemed to fascinate her eyes.

"You'd better be goin', Norah," said her mother solicitously. "You'll only get home now before the storm gets goin' hard."

III.

Outside the door Norah turned and looked towards the barren arms of the ash-tree standing beside the grave of

"So. It is good. I tell them to leave you to me," the old woman said.

her baby that perished as it came. She made as if she would go to it through the snow, but changed her mind, and went down the slope to her house. Arrived there, she went straight to the barn and summoned one of the hands. A few minutes later, in the growing storm, with the wind becoming sharper every minute, she took the trail to Pardon's Drive alone.

A madness had seized her to go and bring Nolan back, or to go and take by the throat the girl that drew him away from her, or to die with him in the storm—in the soft, enfolding, quiet snow which had covered up so many tired pioneers of life.

She did not know quite why she went, but she felt that she must go. Some dark fascination of destiny was on her. The touch of the mystic in her Celtic blood stirred her, absorbed her. She was only conscious that she was driving, driving, and forever driving towards Pardon's Drive. How long it was, how cold it was, how still it was, this long road to Pardon's Drive! Did Nolan find it so long as he drove day after day? Ah, no! Nolan found it short, for there was some one waiting at the end—a flower of life to be plucked for his wearing!

Words Noland had sung in the days before their tragedy haunted her ears now, as the horses plunged through deeper and deeper snow, as the rugs on her knees became piled higher and higher with the soft flakes, as the drifts gathered heavier and heavier in the sleigh where she sat.

"It was as fine a churchful as you
ever clapt an eye on;
Oh, the bells was ringin' gaily, and
the sun was shinin' free;
There was singers, there was clargy—
'Bless you both,' says Father
Tryon—
They was weddin' Mary Callaghan
and me."

By and by it seemed that they made no progress. Heavily, with stupefying weariness, the horses plowed their way through the snow. How many hours had she been going? She did not know. Night was falling, and she had no idea where she was, nor did she much care. The cold was numbing, and her body seemed to grow less and less material. She was like one that was slowing withdrawing her soul's self from its mortal home, leaving that home desolate and still and nerveless.

But the horses know. They had been over this trail—how many hundred times! Their feet felt the true road under them—felt it, kept it. Their senses were concentrated on one thing—the end of the journey, rest, food, the warm stable at Pardon's Drive. Their tragedy would be in not getting there; Norah's tragedy might be—would it be?—in getting there.

None knows the silence of this world who has not been blanketed by falling snow and swept by drift. There is no universe, no time, nothing but this wheeling sphere of your own, in which you move alone—alone, the whole world dead but you.

Into this vast solitude, this silence, this dead world, a light suddenly pierced. It was the lantern hanging outside the door of Jacques Charron's tavern at Pardon's Drive.

Yet Norah did not move. She was like one who has lost consciousness of life and time.

They carried her in—it had not been

(Continued on page twenty-two.)

Just Like Boys

Men Folks and Kitchen Fixin's

By Laura Pearson Felton.

I made a trip out into the country with one of our state college extension specialists in home economics one evening. She was giving a lecture and demonstration which required the use of some of the more modern cooking utensils, all designed to show that real economy can be realized by their use.

After the demonstration the men and women gathered around the table to see the labor-saving and convenient devices the lecturer used. Do you know, those men acted just like boys over the things they saw? The improved egg beater, mechanically perfect, but not expensive, handy measuring cups and well shaped bowls, pots and pans, all were wonders to them. They really admired them and inquired about them in detail, even more than the women did. Why? Just because for the first time they had seen just how simple and interesting a woman's work can be when she is provided the right tools to work with. How many women try to interest the men in such things? Not many. Most farmers' wives go year after year with the mended kettle and the egg beater that skips a cog more often than it catches. It really isn't economy.

Economy is making the most of time as well as of money. Time really is more valuable than money. So many useless steps are taken and precious moments wasted that the wonder is that we accomplish as much as we really do.

Wash Dishes, Scrub Floors.

Many women, farm women especially, seem satisfied to let their lives mean just a routine existence of cooking, washing dishes and scrubbing floors. Their interest, in many cases, is bounded by the four walls of their kitchen and I know the average farm kitchen contains few conveniences and a great deal of work.

But sometimes I think we women have ourselves to blame for much of our drudgery. Several cases brought to my attention have led me to the conclusion that the men folks themselves would take interest and find pleasure in helping to make the kitchen convenient if the housewives would take time, or save time somewhere, to talk things over with their husbands and ask them to help them plan things so kitchen burdens might be lightened a little.

In the morning there are so many, many duties to be attended to. At noon the dinner work takes all the time and at night when the last supper dish is washed and put away and the kiddies are all tucked in, mother is just too weary to do anything but crawl off to bed.

Happy Words Scarce.

Father reads the farm paper and takes a glance at the markets and the war news if a daily paper is handy and then he follows his wife's example, and disappears in the direction of his bed. There has been little conversation of any character outside of the day's grind and every day is about the same as the day previous. Dishes and diapers, pigs and potatoes, chickens and chilblains, crops and the weather—these are the things the average farm woman has to think about these winter days. No wonder farm life grows monotonous and lacks what the city woman calls "color."

Head or Heels.

A friend of mine taught me a valuable lesson. She had three little children and a house which was not very conveniently arranged and heaps of work to do, yet she always found time to tidy herself up and rest awhile during the afternoon. I asked her how she managed and this is what she told me:

"I plan every move I make to accomplish just as much by that move as I can. When I go to put away the groceries just brought home from town I always open the cans of coffee, baking powder and such things then and there, because when I want to use them later I may not have the time to open them. Then, I never go upstairs without looking about to see what needs to be carried up. I try never to go empty handed up and downstairs. I find I save many hurried trips up the steps in this way. The same rule, or habit, I practice, when going down cellar or out to the milk house."

A very homely but true saying is, "What you haven't in your head, you must have in your heels." Which is the weariest at the end of the day, your head or your heels?"

Popular Crochet Designs

By WINIFRED WORTH

Shell Beading.

An attractive crochet that repeats well.

Chain 21.

First row—2 t. in 4th ch. from hook, ch. 2, 2 t. in same st., making shell, 1 t. in 7th ch., ch. 3, miss 7 st., 1 t. in next ch., miss 2 sts. make shell in next st., 1 t. in last st. of foundation chain, ch. 4, turn.

Second row—One shell in shell, 1 t. in next t., 10 t. over 8 ch., 1 t. in next t. 1 shell in shell, 1 t. in 4 ch. at end of shell, ch. 4, turn.

Third row—Repeat rows 1 and 2 until at end of 5th row, ch. 5, fasten in 1st loop of ch. 4, with sl. st. (for scallop), ch. 5, fasten in second loop of 5 ch. with sl. st. ch. 1, turn, 10 d. over ch. 5, 5 d over part of next 5 ch., ch. 5, turn, fasten back between 10 d. of scallop below with sl. st., ch. 1, turn, 5 d., 4 ch., 5 d. over last 5 ch. 5 d. over rest of 5 ch., fasten with sl. st. in top of last t. ch. 4. Make one row of work. At end of this make another scallop. Repeat to desired length.

Cloverleaf Insertion.

A pattern that never grows old and is very effective on a wide range of articles.

Chain 30.

First row—One t. in 4th st. from hook, 2 t. in next 2 ch., skip 2 ch., 1 t. in each of next 4 sts., ch. 6, t. in 6th ch., 3 in next 3 ch., ch. 2, 3 t., turn.

Second row—Chain 3, 2 t., ch. 2, 4 t. ch. 6 (1 d. 4 t., 1 d.) in each space of 2 ch., ch. 6, 4 t., ch. 2, 3 t., turn.

Third row—Chain 3, 2 t., ch. 2, 4 t., ch. 6, t. in center st. of middle petal, ch. 2 t. in same st., ch. 3 t. in same st., ch. 2 t. in same st., ch. 6, 4 t., ch. 2, 3 t., turn. Repeat 2nd and 3rd rows for length desired.

Never a Day.

There's never a day goes by, dear,
But it brings at the set of sun
A sense of peace and of joy, dear,
For all that the Father has done.

There's never a day that's dark, dear,
For each night I can truly say,
"There's one strong heart that has loved me
And will love me all the day."

There's never a day that's sad, dear,
For at night when the shadows fall
I thank God He gave me you, dear,
For in you He has given me all.
—Carrie L. Burton in Farmer's Mail and Breeze.

Wool Jersey Sport Coat.

This smartly cut little garment last season would have been called a wool jersey sport coat, but now, in Paris it is referred to as the stockinette service tunic. It is adapted to service in both town and country and perhaps on the whole the name is not inappropriate. Stockinette is a wool jersey of especially fine and smooth weave.—Kansas City Star.

A Twisted Vanity Bag.

Select a small, round mirror and a pair of monogram embroidery hoops, the smaller of which will just fit the mirror's rim, says the Kansas City Star. Cover the back of the mirror with a scented silk sachet, and around the small hoop plait a piece of heavy taffeta silk or ribbon. Press the plaits with a warm iron and sew up the bag. Then sew the plaits smoothly to the other hoop and twist the plaited silk until the opening is closed. Then slip the larger hoop over the smaller one and hold the silk near the steam from a boiling kettle. When it is slightly damp, rest the warm iron over the top until it is dry. This will produce a permanent twist to the plaited silk so that the bag will readily twist itself closed. Provide with a small powder bag and a puff and lay away in the gift box ready for Christmas.

The Safety Kero Lamp

The Safety Kero Lamp makes its own gas from either common coal oil or gasoline. Turns night into day. Gives better light than gas, electricity of 18 ordinary lamps at one-tenth the cost. For Homes, Stores, Halls, Churches. Can be used for a hanging lamp or reading lamp. Absolutely safe.

Simply send us Money Order for $7.50; receive this lamp; use it for 15 days; if not satisfied in every way return it to us, and we will refund your money, less postage.

THE SAFETY LAMP CO.
208 North Howard Street,
SPOKANE, WASH.

Big Business Opportunity for Right Men

We wish to hear at once from energetic, reliable men to whom we can assign valuable territory to handle McConnon's Products. Business is your own, permanent, profitable and steadily increasing. Capital and experience not required—we give full co-operation. Can refer to hundreds of McConnon Dealers, operating for years. McConnon & Company are well known, thoroughly established. McConnon's Products are bought by every farm home. Open territory limited. Splendid opportunity. Write at once for further information.

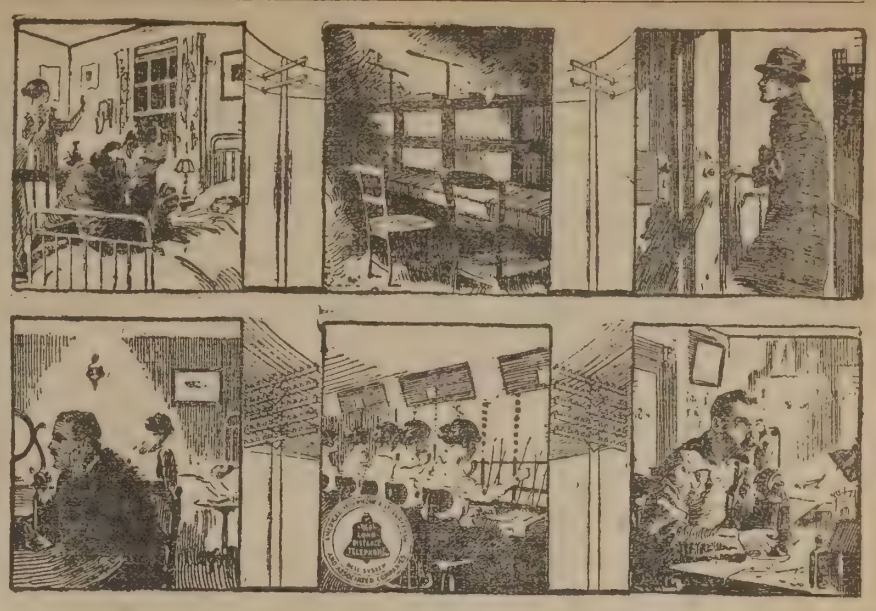
Ingenuity

By Women Folks of Farm Home

At the farm school in Chehalis, Wash., Miss M. E. Sutherland of the extension department of the state college spoke at length upon the advisability of simple living and of living as cheaply as possible in this day when the cost of living is so very high. She said that 75 per cent of the men in the United States were making less than $600 and that the average income today was $459, and that we are an extravagant nation and that it is part of the woman's business to economize in every way possible in order to get the most out of what they have to do with. Every woman owes it to her family and herself to look and appear well at all times, and with just a little deftness of the fingers this is possible in matters of dress. Especially should the young girls and women of the family use ingenuity and make an attempt at taking the things they have at hand and seeing what they can make of them. Many times an attractive hat or some article of wearing apparel can be made with material we have at hand. Anyway, the willingness to try will many times result in a great deal of satisfaction. Miss Sutherland demonstrated all the steps in the making of a stylish hat, which any girl or woman could make. She tried to impress her audience with the importance of dressing in good taste and becomingness in a hat rather than in the prevailing style. The hat which she demonstrated could be made at home for the sum of $1.50 and was a good looking hat. She wished to impress upon the ladies the importance of individuality and distinctiveness in a hat, saying that those were the touches which really counted anyway, and any woman should be proud of the fact, when materials and living in general is so high, that she could make a good looking and a stylish hat or any article of wearing apparel. She showed how a good looking bunch of violets could be made from a 35-cent bolt of ribbon, which, if you were to buy them at the store, would cost anywhere from $1.50 to $3. She also showed how to make attractive roses of satin ribbon, and other ornaments at home.

Kitchen Devices.



One afternoon she gave to "simple kitchen devices," which could be made at home by the woman herself if need be, in order to lighten the housework and make work in the kitchen more interesting. First of all, the kitchen should be as light and attractive a room as any room in the house, and even more so. It should have light walls, light colored woodwork, which is easily cleaned, neat curtains and be a place where one is anxious to stay rather than anxious to get away from. She spoke especially of the iceless refrigerator, made at home at almost no cost, the fireless cooker, and showed how indispensable the tea wagon is, and how one woman made one for the sum of 85 cents and finds it one of her greatest labor saving devices. This could be made from a small table, on casters, or the one which she described as costing but 85 cents was made from an old-fashioned washstand and the wheels of a baby buggy with a little white enamel, and she finds she saves a great many steps in carrying dishes and food to and from the kitchen. The average woman washes five acres of dishes in one year for a family of two.

WAR HITS DOGS

Less of Them Needed in England.

A movement has been started in England to reduce the canine population of the island. It is declared by economists that there is a large surplus of dogs and that keeping them is a luxury which the country should dispense with in a period of war time sacrifices.

It is pointed out by the foes of Tige and Sport that England has more dogs per capita than any other country in Europe, with less need of them than any other.

Best and Cheapest Service in the World

Here are some comparisons of telephone conditions in Europe and the United States just before the war.

Here we have:	*In Europe:*
Continuous service in practically all exchanges, so that the telephone is available day and night.	Nine-tenths of the exchanges are closed at night, and in many cases, at mealtime.
A telephone to one person in ten.	Not one person in a hundred has a telephone.
3,000,000 miles of interurban or long-distance wires.	Not one-eighth as many miles in proportion to population and territory.
Prompt connections, the speed of answer in principal cities averaging about 3½ seconds.	In the principal cities, it takes more than twice as long for the operator to answer.
Lines provided to give immediate toll and long-distance service.	No such provision made. Telephone users are expected to await their turn.

As to cost, long-distance service such as we have here was not to be had in Europe, even before the war, at any price. And exchange service in Europe, despite its inferior quality, cost more in actual money than here.

Bell Service is the criterion for all the world, and the Bell organization is the most economical as well as the most efficient servant of the people.

NORAH

.... BY ....

GILBERT PARKER

(Continued from page nineteen.)

easy to unloose her fingers from the reins. As she was laid down on a sofa she was only conscious of two things—the voice of a child, and the voice of Nolan. "Norah! Norah!" Nolan's voice called. It was so very far away.

At length she awoke, and it seemed to her that she had been asleep for years, so changed were her feelings, so peaceful was her mind. An old woman sat beside her, and leaned forward when her eyes opened.

"So. It is good. I tell them to leave you to me," the old woman said. "I have seen it, that cold. Bien sur! I have seen them all stiff. It was not so with you. You had no heart to fight that cold—so, like that." The quizzical, kindly eyes searched Norah's. "Bien, it is good to sleep.

"How long have I slept—where am I?" Norah asked.

"In Jacques Charron's house, so quiet and nice: voila!"

Again the old eyes searched Norah's face.

A cloud gathered in Norah's eyes. "Yes, I remember. 'Twas hard on the horses. 'Twas Nolan's best team. Are they all right? Nolan 'd not like to see them bad."

Her eyes went round the room eagerly, plaintively, yet not with the bitter passion, the hopeless pain of—

The golden haired girl.

when was it? How long was it since she came? What had happened? Where was Nolan? The child's voice she heard—was it all a dream?

Nolan's voice—had it been really Nolan's voice? Had she imagined that his arms were round her, laying her down, stroking her face?

"How long have I been here?" she asked.

"Quel heure? It was nine to the clock. Now it is 12. Certainement! They have gone to bed, all but you and me, and——"

A child's voice rose plaintively in the night—so near. Why did it pierce to Norah's heart, make her tremble so?

She raised herself on her elbow and turned in the direction of the small voice. The old woman opened a door softly, and made a gesture for her to see. Her heart stood still.

There, in a rocking chair in the next room, in the red light of a great fire, sat the girl "with hair like a sheaf of wheat," and in her arms, pressed to her breast, was an infant, to whom she was crooning softly.

As Norah gazed with eyes that almost started from her head, a wild passion seized her. It was like some ether poured through her veins. Life seemed suddenly to expand in her. She was in a palpitating atmosphere which inflamed her whole being. She saw Nolan rise from a couch near the fire, come forward to the golden-haired girl, and touch the child's soft cheek with a forefinger.

"Little darlin'," he said, with a note in his voice that she had never heard in all the days they had lived together.

Then she went mad.

Nolan stepped back, startled, as she rushed forward into the room. In the red light of the fire, with her eyes blazing, her arms outstretched, her fingers crooked like some bird of prey, she looked like an avenger in a Greek tragedy.

"'Tis as I thought!" she said in a whisper, her lips so dry with passion that she could scarcely speak. "'Tis as I said! 'Twas for this I was left alone yonder, while the wanton had her way!"

With a startled cry the Charron girl got to her feet with the child, and at first she trembled so that the babe almost fell from her arms; but presently a dark flush of indignation passed over her face, and she drew herself up with pride. If anger could have killed, Norah must have died there before her.

"Imbecile—fool!" she said, and when she opened her mouth a finer set of teeth showed than Norah had in her head, and that was saying much.

"Hush, hush—the baby!" said Nolan, and stepped forward towards it. Norah made as though she would come between, but Nolan's arm shot out before her.

"Wait! You will wake the child," he said quietly. He took it tenderly from the girl's arms and placed it in those of the old woman, who, entering with Norah, had stood with ironical humor watching the drama. She was so old that her pulses were not disturbed by the passions of others; but such scenes as these gave sensations which replaced the stirring episodes of youth and middle age. She took the child gently and put its fresh cheek to hers, quavering an old French chanson:

"J'ai faim, j'ai froid!
Pitie! noble dame;
J'ai faim, j'ai bien froid,
Prenez pitie de moi—
Prenez pitie de moi."

"Into the other room, Ma'am Charron!" said Nolan. "For a minute then —'tis not for a child's ears this."

He was very quiet, and his eyes dwelt on Norah's face with a look of command when he turned round again to the women standing in the light of the fire. Then he said to the girl:

"Sure, you had better go, Annette. There are things to say."

"Yes, there are things to say," interjected Norah, trembling. "And you had better stay—Annette!"

There was a scorn and an anger in the last word which made Annette's blood tingle.

"What have you to say to me?" she asked Norah fiercely. Her eyes seemed as red as the fire that burned on the hearth.

"Is there no shame in ye?" said Norah. "I'm his wife. Did ye need to stay and shame me with——"

"Madame, you are a liar, and you are a fool. If I was a man I would kill you." Annette Charron's fingers twitched.

"Ye flaunt the child in my face——" Norah burst out in a high-pitched voice, but got no further, for Nolan caught her arm with a grip that made her cry out.

"Be still, woman!" he said in a voice gone suddenly hard. "Would ye wake the dead? Can't ye let the dead lie in peace with the promise I made—with the promise I made!"

"What dead?" asked Norah in a trembling voice, for it came upon her all at once that she had blundered.

"Can't ye be kind"—Nolan protested —"you that's just back from the dead, Norah? A little longer out in the snow and you'd have been lyin' as she is lyin' in there." He jerked his head toward another room with a closed door.

"Who is lyin' in there?" Norah asked with trembling lips.

"The mother of that," he added, with a nod toward the child, which Madame Charron was crooning to sleep. "She was caught in the storm, too, but it was too strong for her. She gave the child all the warmth she had. And a fine boy it is, the finest iver was almost."

With a cry that came as though from a spirit released from prison, Norah swayed, then, fainting, she fell forward. Annette Charron caught her as she fell. She and Nolan laid her on the sofa, and together they set about restoring her, while the old woman watched from the doorway, irony still in her look.

"A good match it would have been," the old woman said to herself. "A fine man to see—that Nolan! If I had been Annette, I would have scratch' her eyes out," she added. "But Annette's a good girl of her kind," she murmured as an afterthought.

"You'll forgive her?" said Nolan gently to the girl. "'Twas a madness in her, shure."

The girl looked at him for a moment very steadily, and seemed about to speak, but instead she turned away for a moment and busied herself with adjusting Norah's head to the pillow.

"Then, don't you be hard on her—ever," she said presently, with meaning

Annette Charron caught her as she fell.

in her tone and a face grown pale again after the passion of the last few moments.

"Oh, I've never been hard on her, and never will," answered Nolan.

"M'sieu' Nolan, you are a fool," rejoined the girl sharply. * * * "There, she is coming to—make her understand the truth," she said grimly. "Make her understand—absolument. I am going to bed," she added, and before he could say more, she was gone.

In her place came the old woman with the child. "It was time Annette went to bed," she said dryly.

Presently Norah's eyes opened and rested on Nolan's face. Her hand was in his. There was that look in his eyes she had never seen before.

"Who was she?" asked Norah.

"Annette? You know—as good a girl as any, as——"

"No, the dead woman in there," she pointed feebly to the other room.

"'Twas a stranger, come from buryin' her man in the north. And now she's gone, poor woman."

Suddenly he leaned over Norah. "What made ye come here, Norah? What were ye after?"

"Where should a woman be but with her husband?" she answered evasively.

"Thrue for ye," he said, with a strange look. He knew that he had torn her heart. "Thrue for ye. Where should she be except with her husband —and the child?"

She stared at him. Her face grew white. "The child!" she repeated anxiously. "Shure, I have no head, Nolan. I don't see at all, at all. I am sorry I spoke so wild and bad to the girl, but there was something in me that drove me crazy. I don't understand, Nolan, dear."

"I've made the child me own, Norah —me own for iver and iver. I promised the dead woman I'd do it. I promised for you and for me. She was a fine woman, about your 'age"—ah, the incomparable liar!—"and she wint away at peace; for she saw in me the makin' of a fine father to her child. Are ye with me in this, Norah?"

Norah saw a light glimmer out of the dark, which would grow and grow to a wide radiance, would lighten all her world.

"Oh, give me the child!" she cried, all the mother hunger in her, her face glowing, her hands outstretched. The old woman put the babe in her arms. She pressed it to her breast passionately.

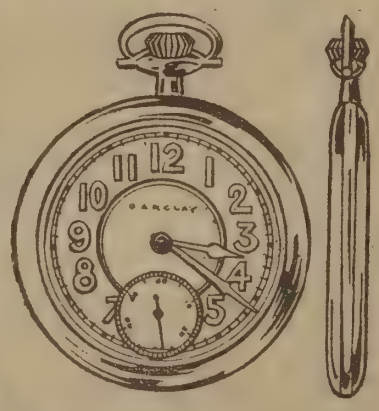
Nolan watched her with a wonderful look of pride and content in his face.

"We'll make-believe," he said gaily to her in a whisper.

"There's no make-believe,' she answered, with a look of fierceness almost. "It come to me out of the storm —'tis mine, 'tis mine!"

"Acushla," said Nolan gaily. "'tis yours then"; and he touched the child's cheek.

The next morning, when they left, Nolan's goodby and his gay wink and word to Annette, with the hair like a harvest of wheat in the sun, were careless enough for Norah to be sure that the farewell of its kind was final. And so it was. But Annette—who knows? The heart of a woman is a strange thing.



Coming Events.

January 10-13—Interstate Poultry club, Hillyard, Wash.
January 8-17—Idaho State Seed Growers' association, Pocatello.
January 8-17—Idaho State Dairy association, Pocatello.
January 8-17—Idaho State Swine Breeders' association, Pocatello.
January 8-17—Idaho State Live Stock association, Pocatello.
January 15-18. — Idaho State Grange, Nampa.
January 17—Idaho State Cattle and Horse Breeders' association, Boise.
January 18-20—Madison County Poultry and Pet Stock Show, Rexburg, Idaho.
January 22-27—Annual farmers' week, University of Idaho, Moscow.
January 30-February 1—Idaho State Horticultural association, Boise.

Ancient Honeycomb.

Two hundred and sixty-five feet below the surface in Oklahoma, a petrified honeycomb was found by zinc miners several days ago. Alex Findley took the specimen to Kansas City, Mo., to have it examined by zoologists. The cells which formerly contained honey are clearly outlined in the rock. Scientists say the bees built the comb more than 2000 years ago.

Other Boys Have Watches

Here's a Chance For You

Scores of bright, energetic farmer boys in Washington are making good in our watch club by making use of their spare moments. We will tell you how to secure one of these

Luminous "Daynite" Watches

They show exact time day or night at first glance. Thin model, seven-jewel, 10-year, gold-filled case.

Our present supply is limited and they are going fast. Don't put off writing if you want one of these beautiful watches.

THE WASHINGTON FARMER

Premium Dept., Room 37, Review Bldg., Spokane, Wash.

HAD A FINE CAMPING TRIP ALONG ELK RIVER IN OREGON

Dear Aunt Nellie: One Sunday, in Oregon, we were going on a camping trip. Papa hitched up Buck and Jumbo, our two horses, to the old buggy. Mamma put up a basket full of good things to eat, and we started very early for a long trip. First we went around an old mountain called Baldy, whose high top reached above the timber line. Then we followed Elk creek with the oaks, firs and dogwood on the mountainside above us. Papa got out and gathered the beautiful dogwood blossoms, which he gave to us until we had our arms full. Then we drove on down Elk creek until we came to a town called Drain. After going through town, we again followed Elk creek. About two miles below Drain, we passed a sawmill, then turning up a road we saw a water fall. All around we could see where the cable of a donkey engine had nearly sawed down giant trees. Soon we were over in a valley called Hard Scrabble. After going to the farther end of the valley we stopped to eat our dinner. We built a fire out of branches of trees, and rails of an old fence. After we had eaten our dinner we sat around the fire and watched the lizards play on the rails of the old fence. First they would run up one rail and then down another. When it was time to go home, we got back in the buggy and went home declaring that we had had a fine time. I was 10 years old August 29. Have I a twin? I am in the fifth grade at school. I never went to school until last April. Our teacher's name is Mr. Todd.—Albert Coffey, Hay, Wash.

CAT, PUPPIES AND A FEW CHICKENS ARE GRACE'S PETS

Dear Aunt Nellie: I am 9 years old. My birthday is September 5. Have I a twin? I live on a farm of 40 acres. I have quite a few pets such as a cat and some little puppies and a few chickens. I have three brothers younger than I. Their names are Lawrence, Robert and John. We call John Jack most of the time. Lawrence is seven years old, Robert is five and Jack is three years. Papa has four head of horses, ten head of cows and four heifers. All of our cows are Holsteins, excepting one and it is a Jersey. A young horse and a mule came here. There is a little creek running through our farm. We are completely surrounded by mountains. Our school house is white outside. It has large blackboards and it has a globe and a lot of good maps.—Grace Elizabeth Balsley, Enumclaw, Wash.

HAS TWO PLAYFUL KITTENS; LIKE TO SLEEP ON THE BED

Dear Aunt Nellie: I am a country girl 10 years old and four feet seven inches tall. I was 10 December 10. I go to school just a little ways. I am in the fifth grade. The hardest study for me is arithmetic. We have three cows, one calf, three horses and one little pig. Our cows' names are Beauty, Daisy and Floss, and the little pig's name is Molly. We have two little kittens. They are very smart little things. They will climb upon the couch and lie down and go to sleep. Our school teacher's name is Miss Ona Langlin. She boards with us. Sometimes the kittens get up on her bed and go to sleep. Our little kittens' names are Aaron and William. They like to get upon your shoulder and pull your hair and tease you. I can crochet and can milk the cow.—Freda Criswell, R. F. D. 1, Oakville, Wash.

DORA WISHES TO BECOME A MEMBER OF THE CORNER

Dear Aunt Nellie: I am 13 years old. My birthday is January 27. I like to go to school. I am in the eighth grade. My teacher's name is Mr. McCabe. I have a kitten named Snowball because she is white. We have a dog, two horses and about 18 head of cattle. I have an organ, but can not play it very well. We have six children in our family, four girls and two boys. My father takes The Farmer and I sure enjoy the Children's Corner. I want to be a member of it.—Dora Dunaway, Glenoma, Wash.

HAS A LITTLE COLT THAT WILL EAT TOBACCO LEAVES

Dear Aunt Nellie: I am 11 years old and my birthday is October 22. I and my brother go to school at Lone Pine. I am in the fifth grade. We only have a quarter of a mile to walk. We live on an 160-acre farm. We have 160 chickens and three geese. We have eight head of work horses and five colts. On little colt will eat tobacco. We have four cows. I have four brothers and two sisters.—Myrtle Goldie Ledbetter, St. John, Wash.

FLOSSIE IS ONE OF FIFTEEN PUPILS AT PENAWAWA SCHOOL

Dear Aunt Nellie: I am going to describe my schoolroom. There is a large United States flag in front and there are pictures on the wall. There are three windows on the east side and three on the west, and a large Waterbury heating plant in the corner by the door. There are 15 scholars going to my school. I am in the seventh grade. I was 13 November 8. I have blue eyes, golden hair, weigh 81 pounds and am four feet 11 inches tall. Have I a twin? I have a little sister, with blue eyes and brown, curly hair. Her name is Madeline. I also have two brothers. I am the oldest. We are planning on having a large program on Washington's birthday. We are boarding the teacher and like her fine. Her name is Georgia Saxon. I have a quarter of a mile to go to school.—Flossie Stevig, R. F. D. 1, Penawawa, Wash.

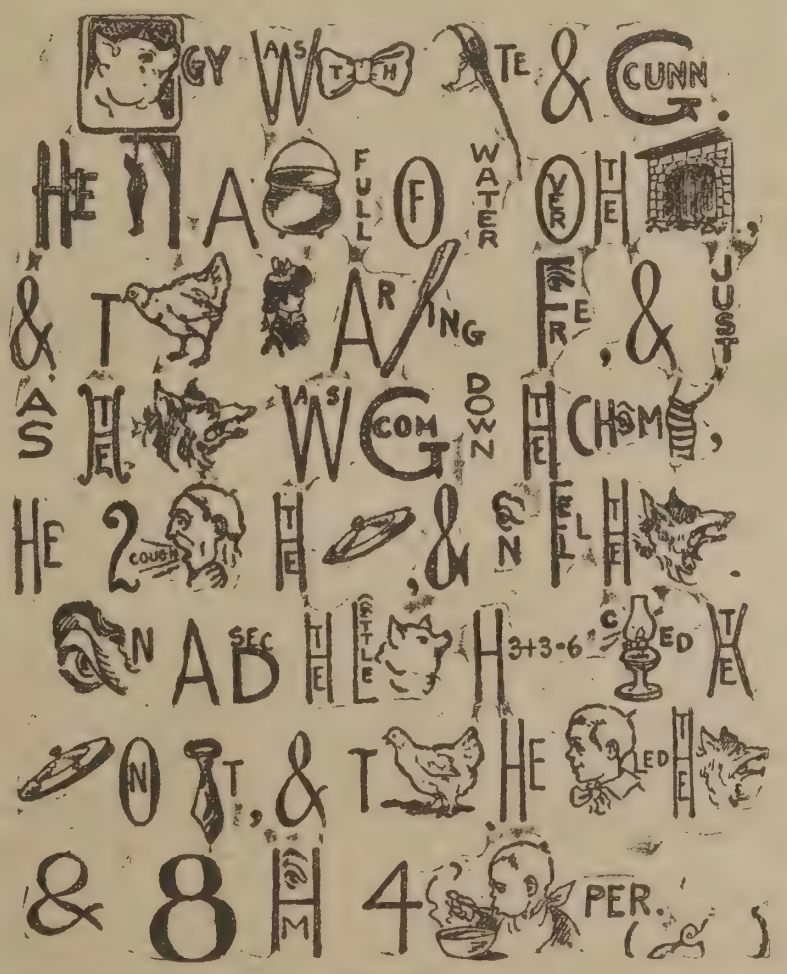
FUN TO PLAY IN THE GRAIN ON THE FARM DURING SUMMER

Dear Aunt Nellie: My subject is "Fun on the Farm." It is very much fun to play in the tall grain on the farm in the summer. I like to help my mama gather the eggs in the barn and chicken house. We milk cows and I think it's very nice to go hunt them in the summer time. They run on a nice pasture upon a hill. I go to school. I am in the fifth grade. We children walk about a mile and a half. I like to go to school very well. About 40 children go.—Rosey Johnson, Hassan, Wash.

IONE HELPS HER MOTHER WITH THE WORK BEFORE SCHOOL

Dear Aunt Nellie: There are 22 pupils in our school. There are three nice blackboards and five rows of desks and five windows. Our teacher's name is Miss Rice. She is very good to us. I am nine years old and in the fourth grade. There are two pupils beside myself. They are nine years old, too. My birthday is June 24. I would like to correspond with any girl my age. I have a baby sister. She is 18 months old. She has blue eyes and brown, curly hair. I have blue eyes and brown hair. I help my mother do the work before I go to school and after I get home from school—Ione Luce, R. F. D. 3, Stanwood, Wash.

PEARL ATTENDS THE STATE NORMAL SCHOOL AT BELLINGHAM



Dear Aunt Nellie: I am 12 years old and weigh about 90 pounds, and am five feet and seven inches tall. My birthday is May 30. Have I a twin? I am in the B6 grade. We have a teacher for each study, which is 14, and then we have a supervisor for each. There are 14 children in our room. There is only one class in a room and there is only half of the B6 class. The name is State normal school. I have many pets. I have a Spitz pup. His name is Spoke. I have three rabbits. Their names are Bill, Bell and Rag. Rag had nine little rabbits and they were all frozen to death. I have a pair of buff bantams. They have feathers all over their legs, which makes them look very queer. They are very tame. They are always about your feet. Their names are Fritz and Dolly. My brother has a pair and their names are Hans and Molly. We were offered $5 for the two roosters, but refused it. I have a cat name Tiger. My mother has six birds, five are singers and one female. One summer my mother raised 32 young birds. I did have some guinea pigs, but our bull dog killed them. He is dead now. A man shot him. I have some pigeons, too.—Pearl Bartruff, 1120 1-2 Dock street, Bellingham, Wash.

MISSED THE MOST OF THE TERM ON ACCOUNT OF SICKNESS

Dear Aunt Nellie: I am eight years old. My birthday is February 25. I have a calf whose birthday is on the same day that mine is. I am living in town. I go to school in town. I am in the third grade. I missed the most of the term on account of sickness.—Gustave Dlaughter, Mansfield, Wash.

Story of the Three Little Pigs

CHAPTER XII.

The end.

Solution to this chapter will appear in next week's issue of this paper.

SOLUTION TO LAST WEEK'S CHAPTER.

"Please let me in," supplicated the sly wolf. "It is so cold outside here."

"No! By the hair of my chinny-chin-chin, I will not let you in," said Piggy.

"Then I will jump down your chimney and get you that way," threatened the wolf.

ENJOYS THE FARM BECAUSE OF FRESH AIR AND EXERCISE

Dear Aunt Nellie: I enjoy farm life very much. It is interesting. Sometimes it is work, sometimes play. We are all at school and very busy with our books, so we do not have much time to write. One or two of my friends told me they have written and I am watching closely to see if I can see their letters. I have not seem them yet. On the farm there is very much fun. You can watch the men when they milk the cows or ride horseback. I think the Children's Corner is growing. We have taken The Farmer for some time. I have read the Children's Corner, too, every time the paper comes. We have 10 cows, and we have a little calf, too. On the farm you also can breathe pure fresh air and have all the exercise you want.—Clara Olson, Bothell, Wash.

ROLLAND IS 11 YEARS OLD. WRITES ON THE TYPEWRITER

Dear Aunt Nellie: We have been taking The Farmer for some time and I enjoy reading the letters in the Corner very much. I was 11 years old on December 2 and am in the fifth grade. I live half a mile from our schoolhouse. We have a nice school. I have three pets, a dog and two kittens. I have no small brothers or sisters and am the youngest in the family. I hope all the children in the Corner had a merry Christmas. I am just learning to use the typewriter.—Rolland Gillespie, R. F. D. No. 1, Monroe, Wash.

LIKES THE FARM; WOULD NOT CHANGE WITH A CITY GIRL

Dear Aunt Nellie: We have a horse and three cows and a heifer. The heifer is my pet. I have a little kitten and he is white. His name is Muff. We have a black and white cat too. The black and white cat's name is Buff. The horse's name is Duke, and the cows names are Fannie, Primrose, and Beauty, and the heifer's name is Daisy. There are five in our family. I have one brother and one sister. We live two miles from town. I am 10 years old and am in the fourth grade. I live about 50 yards from the school. We got a little dog and her name is Pup, and she is a white dog. She can do all kinds of tricks. She can shake hands and sit down, and bark when she wants food. We live on a farm of 12 acres. We have about 10 acres cleared. I do not like to go to school very much. I like to hear the birds sing in the summer time. There are two rooms in our school. We have about 56 children in our school. We had 25 turkeys. My mother raised 30 turkeys, but five of them died. I would not change with a city girl for I like to live on a farm. I forgot to tell you about our pig. He is a white pig. I like to go sleigh riding. Last year we had so much snow that we had to stop school. The Indians say that there is going to be 10 feet of snow this winter.—Aina Alexson.

RUBY HAS NOT BEEN ABSENT FROM SCHOOL THIS WINTER.

Dear Aunt Nellie: This is the first time I have written to the Children's Corner. I like to read the little letters. I am a little girl 11 years old. My birthday was January 4. I am in the sixth grade. I have always made a grade a year. I have gone to school this winter so far without missing a day, nor have I been tardy. Our teacher's name is Miss Venna Patterson. I like her fine. We have an organ in our school. There are four rooms, one for the girls' cloaks, and one for the boys' cloaks, and a hall, and then the room which we study in. We have a nice big stove; just got it new winter before last. We have 24 single seats and four double seats. We have 29 pupils in our school. Our teacher had a Christmas entertainment and she had a time because our school has had the chickenpox.—Ruby Peterman, R. F. D. 3, Parma, Idaho.

DRIVES THE HORSES TO THE FIELD AND GOES AFTER HAY.

Dear Aunt Nellie: I am going to tell about fun on the farm. I am 9 years old and I go with father after hay. Claude, my brother, lets me drive the horses to the field; it is one mile. We went out squirrel hunting last summer. We live on a homestead of 320 acres. I help pick up potatoes and sugar beets and picked up potatoes for a neighbor for a half day and got 80 cents.—Derrell Fulwider, Small, Idaho.

ZELMA LOVES EVERYTHING BUT SNAKES AND BUGS.

Dear Aunt Nellie: I was 10 years old January 8. I love everything but snakes and bugs. For Christmas I got a book, a pitcher and some ribbon. I had a very merry time on Christmas, and hope all the cousins had a good time, too. I go to school. Our school had two weeks' Christmas vacation.—Zelma Kinney, Blackfoot, Idaho.

Grain and Produce Markets

Chicago Grain.

CHICAGO, Jan. 6.—Emperor William's message to his troops that the war would continue acted as one of many elements today that forced a sharp advance in the price of wheat. After an extreme rise of 5 1-4 the market reacted, but closed strong, 2 to 4 3-8 net higher, with May, $1.84 1-8@1.85 1-8 and July, $1.51 1-8@1.51 3-8. Other staples, too, scored substantial gains, corn, 1 3-8 to 1 5-8, oats, 1 to 1 1-8, and provisions, 12c to 30c.

Besides the belligerent announcement of the German emperor the course of the senate in dealing with President Wilson's appeal to the European combatants appeared to have had special effect toward changing sentiment in favor of the bull side of the market.

Corn ascended to $1 a bushel, May deliveries, the highest price since 1892, and with that exception the topmost level in 40 years. Active European buying of futures seemed to be largely responsible. Oats shared the strength of other cereals.

Advancing quotations on hogs and grain caused free buying of provisions. Notice was taken also of the fact that the western receipts of hogs for the week totaled only 607,000, as against 978,000 a year ago.

Cash Quotations.

CHICAGO, Jan. 6.—Wheat—No. 2 and No. 3 red and No. 2 and No. 3 hard, nominal.

Corn—No. 2 yellow, nominal; No. 4 yellow, 95½@96c; No. 4 white, nominal.

Oats—No. 3 white, 56½@57c; standard, 56½@57¼c.

Rye—No. 2, nominal. Barley, 95c @$1.32.

Timothy, $3.50@5.50. Clover, $12@17.

Pacific Northwest Grain.

PORTLAND, Jan. 6.—January delivery: Wheat—Bluestem, $1.62; fortyfold, $1.57; club, $1.54; red Russian, $1.50. Oats—No. 1 white feed, $35.75. Barley—No. 1 feed, $39.

February delivery—Bluestem, $1.63; fortyfold, $1.58; club, $1.55; Russian, $1.52. Oats, $36. Barley, $39.

TACOMA, Wash., Jan. 6.—Wheat—Bluestem, $1.60; fortyfold, $1.57; club and red fife, $1.55; red Russian, $1.50.

SEATTLE, Jan. 6.—Wheat—Bluestem, $1.63; Turkey red, $1.64; fortyfold, $1.56; club, $1.55; fife, $1.55; red Russian $1.53.

Barley, $38.50 per ton.

WILBUR, Wash., Jan. 6.—Bluestem, $1.47; club, $1.42. Oats, $35. Barley, $35. The Graingrowers' Warehouse company bought 7000 bushels of bluestem at $1.50 this week.

WALLA WALLA, Wash., Jan. 6.—Club wheat, $1.42@1.43; bluestem, $1.49@1.50. Barley, $39@40.

San Francisco Grain.

SAN FRANCISCO, Jan. 6.—Wheat—Firm; no trading.

Barley—May, $2.35; December, unquoted.

Minneapolis Grain.

MINNEAPOLIS, Jan. 6.—After a weak opening wheat prices strengthened and the close was more than 3 cents higher. Corn and oats swayed with wheat. Wheat receipts, 262 cars, compared with 399 a year ago.

Wheat—May opened $1.86½ to $1.87; high, $1.90⅞; low, $1.86½; closed, $1.89⅞.

July opened $1.79; high, $1.82⅛; low, $1.79; closed, $1.82½.

Cash—No. 1 hard, $1.97⅞@1.98⅞; No. 1 northern, $1.90⅞@1.93⅞; to arrive, $1.89⅞@1.91⅞; No. 2 northern, $1.87⅞@1.93⅞; No. 3 wheat, $1.77⅞@1.89⅞; No. 2 durum, $1.89@1.96; No. 2 hard Montana, $1.88⅞@1.91⅞.

Corn—No. 3 yellow, 86@92c.

Oats—No. 3 white, 54@54½c.

Flax, $2.84@2.88½.

Flour unchanged; shipments, 49,719 barrels.

Barley, 90c@$1.20.

Rye, $1.41@1.42.

Bran, $27@27.50.

Car Receipts at Coast Points.

Receipts of grain and hay in car lots at coast points for the fiscal year beginning July 1, up to Saturday night were as follows:

Seattle—	Wheat.	Oats.	Barley.	Hay.
1916-17	3605	750	252	2475
1915-16	6346	667	1069	2588
Portland—				
1916-17	3430	1412	121	1256
1915-16	8803	771	1270	1350
Total—				
1916-17	7035	2162	1321	3731
1915-16	15149	1438	2339	3936

San Francisco Produce Market.

SAN FRANCISCO, Jan. 6.—Butter—Fresh extras, 35½c; prime firsts, 34½c; fresh firsts, 33½c.

Eggs—Fresh extras, 38c; pullets, 37½c.

Cheese—New, 18c; Young Americas, 20½c.

Poultry—Hens, 24@25c; old roosters, 11@12c; fryers, 22@24c; broilers, 27@30c; large, 22@23c; squabs, $2.25@2.50; pigeons, $1.25@1.75; ducks, 13@14c; geese, 15@17c; turkeys, 22@26c.

Vegetables—Lettuce, Southern, 75c@$1; fancy, $1.15@1.25; peas, southern fancy, large, 10@11c; cream squash, 75c@$1.25; tomatoes, southern, $1.75@2.00; eggplant, 7@8c; green peppers, large, 10@15c; small, 5@10c; garlic, 3@6c; sweet potatoes, cellar stock, $2.75; celery, $4@4.75; rhubarb, $1.25@1.75; marrowfat and hubbard squash, $1@1.25.

Potatoes—Rivers, $2.25@2.35.

Onions—Car load, $3.75@4.

Seattle Market.

SEATTLE Jan. 6.—With growers quoting $38 f. o. b. shipping points selling levels of Yakima Gems are firm at $45. Futures throughout the month look very strong. Jobbers are buying only as needed, although through the excitement of buying and shipping Puget sound spuds wholesalers have been able to accumulate a few carloads and are holding for an advance.

The visible supply of Puget sound potatoes is dwindling rapidly, either because of large quantities sold or shrinkage. These spuds will depreciate heavily from now on as they are nearing the end of their keeping qualities. In addition, consumers with every sudden cold spell manifest a sharp demand for good baking stock and sales of No. 1 Yakima Gems will proceed to a considerable extent regardless of prices.

Oregon association men apparently control the onion situation, and they are vigorously toning up the market. Jobbers must pay 2 1-2 cents and 3 cents f. o. b., and are selling at 3 1-4 cents and 3 1-2 cents. Stocks here are not heavy, and a 4-cent market is in immediate prospect. The bulk of stock moved is of the smaller boiling variety, selling at 2 1-2 cents and 3 cents.

Apples are easy. Higher prices are not looked for, regardless of the action of the eastern markets, as stocks on hand locally are ample.

Local hothouse rhubarb at 10 cents per pound is in, and radishes and tomatoes will be offered within the next two or three weeks.

While the demand has fallen off, due in part to absence of sustaining orders from Alaska, receipts of eggs have increased, and with this situation the market is weak and falling. Some supreme effort will be required to pull this commodity out of the hole.

The make of fresh creamery butter is running ahead of the demand and is inclined to pile up. So pronounced has the weakness become that good off-color country creamery butter has been underselling June storage butter. Jobbers have been quoted 35 cents and 35 1-2 cents for a grade of country creamery butter that would be acceptable for table use almost anywhere, while storage is firm at 35 cents and 36 cents.

Poultry prices will be unchanged next week. Receipts have fallen to a slight excess over the demand, and the conditions are fairly healthy.

BUYING PRICES.

Unless otherwise stated the following prices are fixed upon a jobbing basis and are average prices obtained in reports of transactions by jobbers.

The following prices are offered to the producer by the local dealers for delivery in round lots f. o. b. Seattle:

Eggs—Local, 36c per dozen.

Poultry—Live hens, fat, over 4 lbs., 17c per lb.; do, 3 lbs. and under, 15c; old roosters, 10c per lb.; springs, 18c per lb.; ducks, 19c per lb.; squabs, large, $3.50 per dozen; geese, fat, 12c lb.; turkeys, live, 24c.

Butterfat—42c lb.; dairy butter, 28c pound.

Beef—Buying price: Prime beef steers, 8c per lb.; cows, fat, 5@6c per pound.

Hogs—Light, 11½@12c per lb.; do, heavy, 10@11c per lb.

Veal—Fancy light, 12½@13c per lb.; do, heavy, 9@10c per lb.

Hides—Salted, 19c per lb.; salt kip, 22c per lb.; salted calf, 32@35c per lb.; green hides, 16c per lb.; salted bulls, 15c per lb.; dry hides (short trim), 32@33c per lb.; dry calf, 12, under six lbs.), 36c per lb.; bull and dry salts, 4c per lb. less; green bulls, 18c per lb.; dry butcher full wool sheep pelts, 20@23c per lb.

Seattle Wheat.

SEATTLE, Wash., Jan. 6.—Taking the handicap of a shortage of cars, Eastern buyers have been active in Washington during the last week for wheat, and compelled Puget Sound millers to meet bids of $1.50 for bluestem and Turkey red and $1.45 for fife in the country. They got little grain, but forced prices up to the level fixed a month ago by farmers for selling. Country holders have now decided that they will not let go until the market goes higher and the talk of $2 May wheat in Chicago is being revived.

The car embargo is still operative on several of the transcontinental lines. The Milwaukee never had one on flour to Chicago and the Union Pacific lifted its 14-day prohibition yesterday.

Puget Sound millers have not been active in the wheat market as all are well stocked up. Such purchases as were made from this side of the Cascades were for export. While the grain markets suffered a setback for the week-end the average for the entire week has been a lift of 11c and bid prices are now within 10c of the peak of the season.

Puget sound millers have been asked for quotations this week on flour for the West Indies, the newest field for exploitation that the war has thrust upon them. They are investigating. The field is unexplored, and without regular steamship service millers are hesitating about opening accounts there unless some show for a permanent trade can be made.

Live Stock Quotations.

At Chicago.

CHICAGO, Jan. 6.—Hogs—Receipts, 17,000. Active, 10c above yesterday's average; bulk, $10.10@10.56; light, $9.70@10.40; mixed, $9.95@10.65; heavy, $10.15@10.60; rough, $10.15@10.25; pigs, $7.60@9.50.

Cattle—Receipts, 500; steady. Native beef cattle, $7.50@11.80; western steers, $7.35@10; stockers and feeders, $5.35@8.40; cows and heifers, $4.30@10; calves, $9@13.25.

Sheep—Receipts, 10,000. Steady. Wethers, $9.25@10.50; lambs, $11.40@13.75.

At Omaha.

OMAHA, Neb., Jan. 6.—Hogs—Receipts, 9700; higher. Heavy, $10.20@10.50; light, $9.85@10.40; pigs, $8@9.75; bulk of sales, $10@10.40.

Cattle—Receipts, 800. Steady. Native steers, $7.50@11.50; cows and heifers, $6.50@10.60; western steers, $6.50@9.25; Texas steers, $6@7.50; stockers and feeders, $6.25@8.60.

Sheep—Receipts, 600; steady. Yearlings, $9.25@11.25; wethers, $8.50@11; lambs, $12.10@13.25.

At St. Paul.

SOUTH ST. PAUL, Minn., Jan. 6.—Estimated receipts at the Union stock yards today: Cattle, 400; calves, 50; hogs, 1800; sheep, 40.

Cattle—Today's small run had no effect on values and for the week prices are 15c to 25c lower on all but canners, cutters, bulls and veal calves. A broadening out of receipts made it easier for packers to fill orders and they assumed a bearish attitude all week on everything above the cutter class.

Hogs—A light run of hogs on the market here today cashed at unchanged rates compared with Friday. Top hogs were bought at $10. There were few real good heavy hogs, light mixed hogs predominating again. Bulk of sales were made between $9.85 and $9.95. The few pigs which were offered changed hands at the same level as Friday, $8.25, taking the best strong weight sorts.

Sheep—Less than 100 sheep and lambs comprised today's offerings in this division. Unchanged rates were paid for the stuff shown. The week closes with best lambs up a quarter and best ewes about 50 cents higher than a week ago. Material has been scarce all week and with a good demand for everything sellers were able to extract better money for the best of their offerings.

At Portland.

PORTLAND, Ore., Jan. 6.—Hogs—Steady; receipts, 467. Bulk of packing grades, $10@10.20; heavy packing, $10.20@10.30; heavy butchers, $10@10.25; light packing, $10@10.20; rough heavy, $9@9.25; pigs and skips, $8.50@9.25; stock hogs, $8.25@8.75; cripples, $8@8.50.

Cattle—Steady; receipts, 176. Steers—Prime light, $8.25@8.50; prime heavy, $8.25@8.50; good, $7.75@8; cows, choice, $6.50@7.25; medium to good, $6.25@6.75; ordinary to fair, $5.50@6; heifers, $6.25@7; bulls, $3.50@5.25; calves, $5@7.

Sheep—Steady; receipts, 80. Lambs, east of mountains, $10.75@11; lambs, valley, $10.35@10.50; lambs, good, $9.75@10.25; choice yearling wethers, $9@10; good yearlings, $8.75@9; choice ewes, $7.75@8; heavy ewes, $6.75@7.50.

At Seattle.

SEATTLE, Jan. 6.—Receipts, 164 hogs, 128 cattle. Market strong.

Hogs—Higher. Prime light, $10.50@10.55; medium to choice, $10.15@10.25; heavies, $9@9.90; pigs, $8.25@9.40.

Cattle—Higher. Prime steers, $8.25; medium to choice, $7@7.25; common, $5.50@6.75; best cows and heifers, $6.75@7; medium to choice, $5.50@5.75; common bulls, $3.50@4; calves, $7@8.50.

Sheep—Prime lambs, $8.50@9; yearlings, $7@7.70; wethers, $6.50@7; ewes, $6@6.50.

Spokane Union Stock Yards.

Hogs—Receipts, 531; market steady. Bulk of sales, $9.75 to $10.10. Prime light, $9.85@10; prime heavy, $10@10.25; prime mixed, $9.40@9.65; rough heavy, $8@8.50; stockers, $6.50@8.

Cattle—Receipts, 3; market steady. Prime heavy steers, $8@8.25; prime light steers, $7.75@8; good steers, $7.50@7.75; feeders, $5.25@6; prime cows, $6.25@7; good cows, $5.75@6.25; best heifers, $6.50@7.25; bulls, $3.50@5; calves, $6@8.

Sheep—Receipts, 14; market strong. Prime lambs, $9@9.75; good lambs, $7.75@8.25; best yearlings, $8.75@9.50; good yearlings, $7.50@8.25; best mutton ewes, $6.75@7.75; good ewes, $5@6.

Household Novelty.

A household novelty is both a nut pick and bottle opener and can be used to hold an ear of corn when it is being eaten.

Portland Market.

PORTLAND, Ore., Jan. 6.—Egg prices went off sharply in the past week and at the close there was a 34 cent market. The trade bought only from hand-to-mouth on the falling market, and as the shipping outlet was poor, stocks piled up on the street.

Butter is holding at the prices, but the market is barely steady. Cheese is selling well on a 20-cent Tillamook basis.

Poultry prices ruled high during the week as the supply was far under the demand. Dressed meats also advanced with light receipts.

Potato buyers are paying up to $1.60 for choice stock and speculators are offering still more, evidently to boost the market. Onions are also tending upward.

Hop trading has been active during the week, low prices having stimulated buying by eastern brewers.

The hide market is steadier in response to somewhat better advices from the east.

In the following list of quotations the grain, hay, millfeed, hop, wool and hide prices are those paid to producers. The other quotations are prices from jobbers to retailers:

Oats—No. 1, $36.25 per ton.

Corn—Whole, $48; cracked, $49 per ton.

Millstuffs—Bran, $26.50 per ton; shorts, $30.50.

Barley—No. 1 feed, $38.50@39; brewing, nominal; rolled, $41@42.

Hay—Buying prices. Timothy, eastern Oregon, $18@21; alfalfa, $17@18; clover, $12.50; grain, $13@15.

Eggs—Oregon ranch, case count, 34@35c per dozen; candled, 37@40c.

Poultry—Hens, 15@17 1-2c; ducks, 16@18c; turkeys, live, 17 1-2c; dressed, 25@26c; geese, 11@12c.

Butter—City creamery, prints, 38@39c per pound; cubes, extras, 34 1-2@35c.

Cheese—Oregon triplets, 20c; Young Americas, not quoted.

Dressed meats—Veal, 14 1-2c; pork, 13c.

Hops—1916 crop, 6@9c.

Potatoes—Oregon, jobbing price, $1.75@2 per cwt.

Onions—Buying price, $3.10 for country points.

Wool—Eastern Oregon, fine, 24@30c; coarse, 33@36c; valley, 33@35c.

Beans—Small white, 11 1-4c; large white, $11.10 per 100 pounds.

Hides—Salted hides (25c lbs. and up), 19c; salted stags (50 lbs. and up), 15c; green and salted kip (15 lbs. to 25 lbs.), 20c; green and salted calfskins (up to 15 lbs.), 28@30c; green hides (25 lbs. and up), 17c; green stags (50 lbs. and up), 13c; dry hides, 30c; dry salt hides, 25c; dry horse hides, $1 to $2; salt horse hides, $3 to $5.

Spokane Market.

The wholesale prices quoted in the list below are not the prices paid to producers or shippers; they are those charged by the Spokane commission houses to the retail trade for standard produce. The prices quoted for live stock, however, are the prices given to the producer.

Potatoes—Potatoes, $2@2.25 cwt; new potatoes, 15c lb; sweet potatoes, $3.

Apples—Washington apples, cooking, 60c@85c; eating, $1@1.25; Wageners, $1.25@1.35 box; Jonathans, $1.25@1.35 box; Winter Bananas, 80c box; Kings, $1 box; Spitzenburgs, $2 box; Baldwins, 90c box; Delicious, large, $1.75@2.25 box; Rome Beauties, $1.25 box; Winesaps, $1.75@2 box; Y. N. Pippins, $1.75@2 box.

Butter—Blanchard cartons, 40c lb; Medo-Maid, 40c lb; Cascade, 40c lb; Gold Coin, 36c lb; Gold Leaf, 40c lb; Better butter, 40c lb; Hazelwood, 40c lb; Peerless, 38c lb; Jersey Belle, 39c lb; Attalia, 40c lb; Diadem, 40c lb; Jersey, 38c lb.

Cheese—Wisconsin full cream, twins, 28c; triplets, 28½c; Wisconsin limburger, 28c lb; brick cheese, 28c lb; domestic Swiss, 30c lb; western cream, Idaho or Oregon twin or triplets, 24c lb; Young Americas, 26c lb.

Eggs—Fresh local ranch eggs, $13@14; fresh eastern eggs, $13 case; eastern storage eggs, $10@10.50 case.

Cattle—Prime steers, $5@6.50 cwt; heifers, $5@5.50; cows, $4@5.

Sheep—Wethers, $6@7 cwt; ewes, $5.50@6 cwt; lambs, $9 cwt.

Hogs—Heavy hogs, $9 cwt; light hogs, $9.50@10.

Live Poultry—Springs, 12@13c lb; hens, 12@13c lb; old roosters, 6@7c lb; young ducks, 11@13c lb; geese, 10c lb; turkeys, 20@25c lb.

Portland Wheat.

PORTLAND, Ore., Jan. 6.—Grain dealers here look forward to much higher wheat prices before the season is over. The advance of the last week has lifted the market to within 8 cents of the record price of the season and there is little doubt in their minds that the highest prices of last season will be exceeded. Private wires from the east predict a $2 market at Chicago and it would occasion no surprise if that mark were attained in the northwest.

Closing offers at the Merchants' exchange for January wheat were: Bluestem, $1.62; fortyfold, $1.57; club, $1.51; red Russian, $1.50.

Tractor

This Man Does Work for Others

That the tractor is not only profitable for the farmer for his own use, but frequently enables him to make a substantial return on his investment in doing work for others, is the statement of J. H. Algard of Watertown, S. D.

Last spring Mr. Algard took a Bull tractor out for his own use. The first thing he did with it was to haul a 40-inch separator weighing 8000 pounds 14 miles into the country and returned with another one the same day. The next thing he did with this tractor was to plow 22 1-2 acres in 26 1-2 hours. The next job was dragging roads. He took the Bull tractor and a King drag and dragged 100 miles of road to the entire satisfaction of the county road commissioner, for which he was paid 50 cents a mile, thus receiving a check for $50.

Oak Log Fortune Lost.

Somewhere at the bottom of East river, near Green Bay, Wis., is a fortune in oak logs. The lumber was lost in a storm about 45 years ago. Efforts to find the timber have been started. The logs were part of a big raft. Expert lumbermen say that in spite of being submerged the logs will still be sound.

MONTANA GRAIN AND DIVERSIFIED farm land in Judith Basin, Shields River Valley, Great Falls District and other good districts. Prices $7 per acre and up for stock farms; $20 to $40 per acre for good grain land; small cash payment—balance easy terms and 6 per cent interest. Have a few places on which the owners will take some good Washington property as part payment—time on balance. Call or write for Montana land list and see us before you go. We can give you some pointers that will cost you nothing and will probably save you a lot of time and worry later. HEGE & SCHIFFNER CO., 715-17 Paulsen bldg., Spokane.

BARGAINS IN FARM LAND.

Our business is loaning money on farm and city property. Occasionally we have properties for sale which have come into our possession on account of foreclosure of loans. These we offer at practically the net cost to us, which is far below their real value, a small payment down, the balance on easy terms with low rates of interest. Send for list.
THE PENNSYLVANIA MORTG. INV. CO.
BOX SIX, SPOKANE, WASH.

GREAT NORTHERN LAND CO.

A non-resident needs money and directs us to sell 640 acres raw land with 500 acres of excellent wheat land, in a neighborhood where wheat yields from 25 to 35 bushels per acre; shipping point only three miles distant; at the give-away price of $9 per acre, one-half cash, balance to suit. This should be good value at $15.

For farm land come to headquarters.
G. N. LAND CO., COR HOWARD AND 1ST.

253 ACRES OF NO. 1 RICE LAND FOR sale at $75 per acre. One good crop ought to pay for the land and all expenses. Water from 8 to 16 feet from surface, and canal running along side of land. $40 per acre cash; would take other property in exchange for balance, or on terms at 6 per cent. C. R. Suggett, College City, Calusa Co., California.

THOUSANDS OF ACRES OF FINE LAND. Irrigated, logged-off and general farming land; along the new lines of the Chicago, Milwaukee & St. Paul Ry. Write or call for free booklets. Immigration bureau, C. M. & St. P. Ry., 2nd and Cherry st., Seattle, Wash.

120-ACRE DAIRY FARM; 80 A. TILLable; 12 acres cultivated; 35 acres ready for plow; 5-room house, barn and outbuildings; 1 mile to town; price, including 9 milk cows, $4000; terms. O. V. Manring Investment Co., 22 Symons blk., Spokane.

1200-ACRE STOCK AND DAIRY RANCH, western Ore., near coast; well equipped; 280 in cultivation; finest kind soil; am offering best bargain in world; half cash, balance to suit buyer. For details address owner, Emil T. Raddant, Siletz, Ore.

154 A., ½ M. R. R., 35 M. SPOKANE, only $30 per a.; 90 a. natural black prairie, cult., bal. not cult.; just as good; large barn; no house; fenced; this is $60 land; ask why the sacrifice. Baldwin & Pfile, Lindelle blk.

RAW LAND, SPECIALLY SUITED TO poultry raising and dairying. Ask for our 1916 offer and monthly payment plan. Office Wall and Post sts., near Post street bridge. Phoenix Lumber Co., Dept. A, Spokane, Wash.

WESTERN WHITMAN WHEAT AND PASture lands from $10 to $40 an acre. Values increasing. Write me about what you want. I shall try to locate you here. H. M. Moffatt, Winona, Wash.

NORTHERN PACIFIC RAILWAY LANDS in eastern Montana at $2.50 to $18 per a. Suitable for farming or grazing. Easy terms. For information write or see W. E. HOLT, MILES CITY, MONT.

SACRIFICE 1400 ACRES; FINEST FARM in county; wheat, alfalfa; railroad station on place; near high school; stock, implements. Easy terms. Photo. Box 135, Ione, Ore.

SEE US FOR ALL KINDS OF TRADES if your property does not suit you. Rogers & Rogers, Spokane.

Embargo on Wheat

Chicago Grain Man Tests Public Sentiment

Both in Washington and throughout the country talk of an embargo on farm products is fading away, and it now seems assured that no legislation of that character will be passed at this session of congress.

President Wilson's disapproval of the movement, and the danger that an embargo law might involve the United States in serious diplomatic controversy have had much weight with many congressmen who were at first inclined to look upon the plan with approval. It is pointed out that agents of foreign governments, particularly of the British allies, have contracted for large supplies of wheat and other cereals, canned salmon, vegetables and fruits, dried fruits and other food products, and the passage of a law prohibiting the fulfilment of these contracts would be resented as an act of unfriendliness on the part of the American government.

A Chicago grain man has been testing public sentiment on an embargo and his conclusions, as published in the Modern Miller, do not seem at all favorable to it. He put the following question to a large number of his correspondents:

"What do those in your community think about the agitation favoring an embargo on export shipments of wheat?" The answers may be summarized as follows:

Consumers are for it; producers are against it!

Town people are for it; country people are against it!

Laborers are for it; farmers are against it!

The "shorts" are for it; the "longs" are against it!

"Proposals to embargo shipments of foodstuffs from one country to another, or from one state to another," says the investigator in his inquiry, "have been topics of recurrent interest, discussion and legislative action ever since the days when the Pharaohs reigned in the fruitful valley of the River Nile.

"The first embargo to be established by our government was in 1794. There were various embargoes afterwards, enacted by congress upon recommendation by the president, between that period and 1815. While it is true the embargoes were instituted as retaliatory measures, yet history shows conclusively that the effects of the embargoes were contrary to the anticipations of the American people and the legislators, their utter futility being demonstrated.

"During the war between France and Great Britain, beginning in 1793, both countries ruthlessly seized our vessels bound for foreign ports. The depredations upon our commerce caused congress to place an embargo on export shipping, which prohibited trading with Great Britain and her colonies.

"If we are to judge what may happen in the future by what has actually occurred in the past, from an unbiased viewpoint, then our conclusion must be that the placing of an embargo upon foodstuffs by congress, would lead to commercial depression in agricultural products, and would not lower the price of bread—which is the issue—so materially that the working man, no matter what his daily pittance may be, would notice any difference in living costs whatsoever.

"A small loaf of bread today costs 7 cents retail. An average family in the United States, according to government figures, is composed of five. It is quite probable that five will eat two loaves of bread per day. For generations the family of five has paid 5 cents per loaf for bread. Today it is paying 7 cents. The question at issue then is:

"Whether or not this government should place an embargo upon wheat, thus reducing the cost for bread to the average American family from 14 cents per day to 10 cents, thereby effecting a saving of 4 cents per day, less than 1 cent for each member of the average family.

"Can the United States government afford to disrupt the channels of commerce; to lay us wide open to foreign retaliation; to reduce the value of the products of the farm millions of dollars; to take away the great opportunity of the American people to help those in other lands, simply to reduce the price of bread 4 cents per day for the average American family?"

Grain Convention

Wants Grain Standardization Act

(Continued from page five.)

elements in the soil. He branded the burning of stubble as harmful and wasteful, advocating the plowing under of the straw that it might become valuable humus in the soil.

Plow deep and corrugate the fields before the coming of winter were two points of his advice. He declared that much of the water that usually runs off during the melting periods could be held and put into the soil if the fields were properly corrugated before snowfall. Such system would also prevent much washing of the land, he added. In order to make this most effective, the corrugation should always be done around the hills, never up and down them. Any implement that would leave the surface rough and uneven would serve the purpose, though he advocated the use of a spring tooth harrow, with teeth about two inches wide. One good harrowing in the spring would, in most soils, put the field back in fine condition for holding the moisture during the dry season.

Eight inches is none too deep to plow, he argued. He said there should be a good soft seed bed two inches deep, and a well packed root bed below it of six or more inches.

"SWAT THE GRAIN SACK"

Bulk Handling Proves a Problem.

The bulk handling of grain occupied the attention of the grain convention one-half day's session. In the absence of G. Lansing Hurd of Oregon Agricultural college a paper on the subject written by him was read by Secretary Shaffer of the grain association.

Mr. Hurd said that in his opinion the handling of grain in bulk was inevitable, and very desirable. He said that experince had shown the system to be practical; that there had been built already 35 elevators in the Columbia river basin, and that by the 1917 harvest 100 more would be ready to handle grain. Admitting that the large number of varieties of grain grown in the northwest worked against the system, he advocated a reduction of the number of varieties produced, expressing the belief that it would be better from several viewpoints if only a few standard varieties were grown.

Smut Makes Trouble.

Opening the discussion of the subject, Huston McCroskey of Garfield said he considered that the smut problem affected the bulk handling problem vitally; that bulk handling required much mixing of wheat and that to mix a little smutty wheat with a lot of clean would reduce the grade of the whole seriously. Others present agreed with him that this was a big question, to be solved only through the solution of the smut problem itself.

R. T. Lord of Spokane spoke against the institution of bulk handling, declaring that grain could be handled just as cheaply in sacks. He produced figures showing that warehouse expense was less than elevator expense. His figures assumed that both the warehouse and the elevator could be emptied once during the season, but others present said that the elevator could be emptied and refilled several times, thus greatly increasing its actual capacity and thereby reducing the cost per bushel for storing and handling. Mr. Lord's figures, based on the assumption referred to, indicated that handling in sacks cost slightly less than 2 cents per bushel, while handling in bulk cost considerably over 2 1-2 cents.

Others who favored the bulk system said that he had overlooked the cost of sacks, which was one of the most important features, and that it far outweighed the saving which he claimed.

Boy's Corn Best

Judged as the Sweepstake Entry

Exhibits and prizes taken at the recent national corn show at St. Paul, Minn., will go far to refute the long maintained but mistaken nation that the Pacific northwest is "not a corn country."

Many prizes were awarded to exhibitors from Montana, Idaho, Washington and Oregon, and a notable feature was the judging of exhibit entered by W. E. Starkey of Prosser, Wash. His entry of 10 ears of Yellow Dent corn was considered by the judge to be the best sample at the show, and was given preference over all other entries, in both men's and boys' classes. The selection of 10 ears was made from corn grown on a 10-acre field which yielded more than 100 bushels to the acre. Master Starkey is but 13 years old, and the fact that he was honored by having his exhibit judged as the sweepstake entry over hundreds of others is a remarkable one.

While all parts of the Pacific northwest are not adapted by nature to the profitable growing of matured corn, there are extensive areas in the warm valleys of the Columbia and its tributaries where corn of the best quality and abundant yield may be profitably produced. That fact was well known to the earlier pioneers, but was lost to view in the subsequent settlement of the elevated regions like the Palouse country and the Big Bend. A memorial sent to congress by the Washington legislature in 1866 set forth the interesting fact that:

"The Walla Walla valley, including that portion which lies in the state of Oregon has produced this season 500,000 bushels of wheat, 250,000 of oats, 200,000 bushels of barley and 150,000 bushels of corn."

Fifty years ago corn growing was considered an important industry in the Walla Walla valley, and 75 years ago corn was grown extensively by the Hudson's Bay company at old Fort Colville in the Columbia valley.

The Washington Farmer was pleased to receive a call from C. A. Parker, teacher of the Valley Heights school, five miles from Prosser, in Benton county, where William E. Starkey is a pupil. Mr. Parker reports that he saw the telegram from the corn show authorities at St. Paul announcing that William E. Starkey had been awarded the sweepstakes entry and requesting a photograph of the lad to be immediately sent.

The father, E. E. Starkey, was awarded a second prize in the district, including Benton, Walla Walla and Yakima counties, while another son, Edward Starkey, was awarded a third prize.

Following is a list of winners in the men's contest from Washington state, giving the number of prize, name, town and county:

District No. 1.

1—J. J. McLaughlin, Oroville, Okanogan.
2—J. A. McGinty, Oroville, Okanogan.
3—C. M. Bottomley, Oroville, Okanogan.
4—John R. Wood, Oroville, Okanogan.

District No. 2.

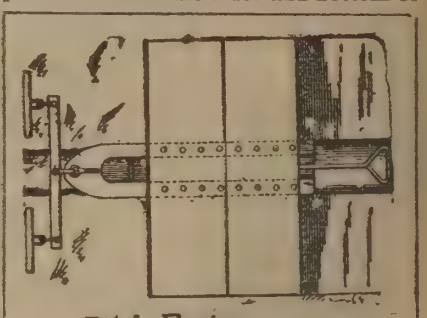
1—Stubblefield Home, Walla Walla, Walla Walla.
2—E. E. Starkey, Prosser, Benton.
3—Simon Shafer, Outlook, Yakima.
4—Walton Terry, Sunnyside, Yakima.

District No. 3.

1—Shadinger Bros., Snohomish, Snohomish.
2—W. Caruthers, Tacoma, Pierce.
3—E. E. Burns, Mt. Vernon, Skagit.
4—J. W. Hall, Mt. Vernon, Skagit.

COWLITZ FARMERS

In Federal Loan Association.



Organization of the Carrolls Federal Farm Loan association has been completed at a meeting of interested farmers of the Carrolls, Shanghai and Mount Pleasant districts at Kelso, Wash. The association will include members residing between Kelso and Kalama. Twenty-three members who have applied for loans aggregating $32,000 formed the charter organization. The directors were chosen as follows: H. D. Phillips and A. J. Lewis, Kelso; C. M. Woods, A. W. Rankin and W. T. McDaniel of Carrolls, and W. S. Carson and Harry Lee Lewis of Kalama.

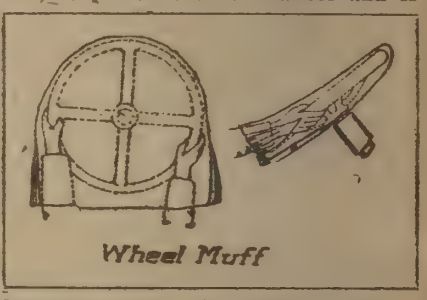
Irrigation Ditch Packer.

The metal boat-like body of this packer smooths the sides and bottom of



Ditch Packer

the irrigation ditch, the top planks smooth the surface on either side and keep the packer at a uniform depth. The resulting smooth ditch permits an even distribution of water.

Steering Wheel Muff.

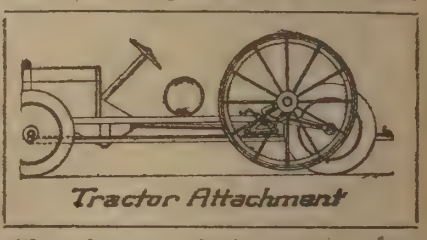
This muff is made of warm cloth or fur; it passes over the wheel and is

Wheel Muff

buttoned around the steering post on the under side.

Calf Muzzle.

This muzzle is a bag made of interwoven iron rings and held open at the

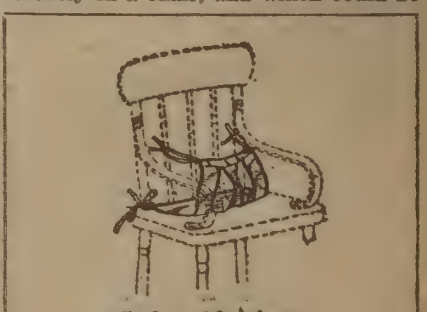


Calf Muzzle

bottom by a large ring. It permits the calf to feed on grass and shrubs, but prevents it from sucking its mother.

Tractor Attachment for Automobiles

The device is attached without altering the car in any way and it is so made that the operator can at will make



Tractor Attachment

either the rear wheels or the tractor wheels bear on the ground. Each rear wheel drives a pinion which in turn drives a tractor wheel.

Baby Holder.

Women with small babies will be interested in a device which holds a baby securely in a chair, and which could be

Baby Holder

made in a few minutes. It is an oblong piece of muslin with two leg slits near one end. It is bound with tape and has tapes at each corner for tying.

NEWS FOR BREEDERS

Shorthorns

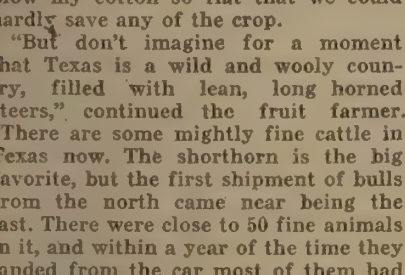
Are the Big Favorites in Texas

By PAUL E. TRIEM.

William Seipp of North Yakima says that Washington is good enough for him. He has a 10-acre apple orchard and raises a few fine horses, and he knows that a "norther" is not going to blow down upon him and freeze him or a gulf storm come hurling inland and lay his crops low.

"When one of those blizzards from the north hits Texas," says Mr. Seipp, "the thermometer may drop as low as 20 above—and that's cold in Texas. A man won't go out in the field to work, and in fact he won't go out at all while the storm lasts, if he can help it. And the gulfs storms seem to be getting more frequent. I've had one of them blow my cotton so flat that we could hardly save any of the crop.

"But don't imagine for a moment that Texas is a wild and wooly country, filled with lean, long horned steers," continued the fruit farmer. "There are some mightly fine cattle in Texas now. The shorthorn is the big favorite, but the first shipment of bulls from the north came near being the last. There were close to 50 fine animals in it, and within a year of the time they landed from the car most of them had died. No one knows, to this day, what killed them, but for a long time it was supposed northern cattle couldn't live in our part of the country. Then is was noticed that the progeny of the bulls that had survived were enough better than anything else in the neighborhood to pay for taking the risk, and the native cattle were doomed from that day. You can travel for miles through Texas now and see nothing but herds of purebreds."



Sheep Fed at Washougal.

In the last year the largest sheep-feeding sheds in the northwest were built at Washougal, Wash., at a cost of nearly $7000 by Frank Russell and G. C. Sheppard. The sheds, six in all, adjoin the tracks of the Spokane, Portland & Seattle railroad, with a capacity of 12,000 sheep, and are fitted with a closed shipping platform which makes possible the loading of 15 carloads of sheep at once. Last winter 70 carloads of sheep were brought here from eastern Oregon and Washington and fattened for two months and placed on the Portland market. This year Mr. Russell is fattening 4000 lambs and sheep, which will be shipped next week to the Seattle stockyards.

Damages for Injured Bull.

J. J. Miller of near Sumner, Wash., has just been awarded a judgment of $250 for injuries inflicted last September on his registered Holstein bull by a bull owned by Santo Gardella, a neighbor. After Mr. Miller had sued for $1500 damages in the Pierce county courts, both neighbors agreed to settle the matter by a tribunal of cattle experts, including William Bishop of Jefferson county, George Gue of Yakima county and Judge E. R. Brady of Grays Harbor county.

PRIZE-WINNING HOLSTEIN.

The above is a photo, snapped by the Farmer camera, of Oregon Lundy Friesland, first prize two-year-old and senior and grand champion Holstein bull at the Pacific International Stock show, at Portland, Ore., December 4-9, 1916, and owned by P. A. Frakes, Scappoose, Ore.

Mr. Frakes is usually rated as the pioneer Holstein breeder of the northwest, because he has been in the business longer than any other man now breeding Holsteins. He used to make the show circuits and win a majority of the ribbons, but of late years has not exhibited Holsteins to any extent and other breeders have become as well or better known than "Daddy" Frakes. But in winning with Lundy Oregon Friesland, a bull strictly of his own breeding and a direct descendant of his old bull, Lundy Oregon De Kol, that was grand champion at the Lewis and Clark exposition in 1905, besides also winning a fair share of the other prizes, Mr. Frakes has proven that he can "come back." There is not a Holstein breeder in the northwest but likes to see Mr. Frakes win. His smile and jovial, kindly words make "Daddy" Frakes as popular as his Holsteins.—H. A.

Young Jersey Bull.

During Farmers' week at the Oregon Agricultural college, January 2-6, A. D. Gribble of Aurora, Ore., purchased the choice young Jersey bull Edith's Oxford Noble, from G. S. Hewitt of Monmouth, Ore., who bred him. The young bull was senior calf and headed the first prize herd at the Oregon State fair, 1916. His dam, Edith's Oxford Belle, was first prize senior yearling at the Oregon State fair, 1914, and has just completed a record of 525 pounds of butter with second calf. His sire, Golden Fern's Noble Jr., is sire of five in the Register of Merit and was first prize aged bull and senior champion at the Panama-Pacific stock show, 1915. He is a show bull and Mr. Gribble is to be congratulated on the purchase.

H. A.

Fine Belgian Mares.

E. M. Ackerman has taken from Salem, Ore., to the A. D. Sloan ranch near Pilot Rock his fine Belgian mares and stud. One of the mares is a direct importation from Belgium.

BRAZILIAN CATTLE EXPOSITION.

Writing from Rio de Janeiro under date of November 17, 1916, Consul General Alfred L. M. Gottschalk says that the Brazilion international cattle exposition is to be held in May, 1917, and in developing the project emphasis will be placed not only upon the fact that the cattle industry is important to Brazil's economic future, but also upon the view that the Brazilian herd may be improved and made to furnish types suitable for the export packing business by the introduction of foreign sires. American cattle raisers will find an opportunity to show clearlyy what types of American live stock would be suitable for Brazilians to import for the betterment of the native stock. Swine and sheep should receive attention as well as bovine stock.

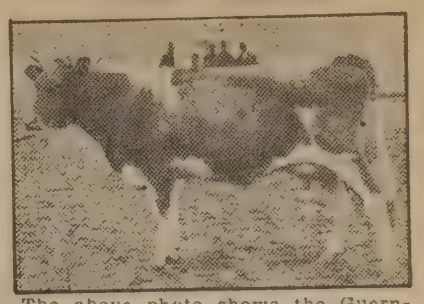
That the Brazilian native stock already possesses some excellent types has been proven by the shipments of Brazilian meat that have gone abroad. They are from ancient Portuguese cattle, more degenerated in some parts of the country than in others, but furnishing some fine specimens, admirably adapted to the climate and pasture. The National society, at the same time it is working for a cattle exposition, is making preparations for a cattle congress to be held at the same time, at which lectures and debates and the interchange of opinions between cattle raisers from all parts of Brazil will be a feature.

Aberdeen Angus Is Champion.

Louden's Live Stock Journal: Smithfield week, with its excitement and its round of meetings, is just the same in days of Armageddon as in times of peace. Of the one hundred and eighteenth exhibition, just closing down as these lines are printed, it can be said that the wisdom of the council in going on with the show has been well proved, for although entries were fewer, the quality of the stock submitted to the judge was never better. There was a plethora of "tops"—for at least half a dozen good animals were worthy of winning outright the cattle championship—and an absence of "bottoms," the mediocre "also rans," so to speak, who pad out the stalls chiefly to catch the eye of the London butcher on the lookout for a Christmas carcase of some show repute. For the third time in his career John J. Cridlan won the cattle championship with an Aberdeen-Angus, a steer this time, against two victories in the past with heifers. So, since 1869, when this Smithfield battle of the breeds was first instituted, the Aberdeen-Angus has triumphed 17 times out of a possible 48, the Shorthorn still holding the lead with 20 victories, crossbred cattle having won on five occasions and Devons and Herefords on three occasions each.

Reports Good Stock Sale.

Auctioneer Bert Wilson reports to the Idaho Falls Register that the W. T. Riley sale is the best that he ever held. Everything sold well. The first five horses offered brought over $200 a piece, the first cow put up for sale sold for $200, a 7-year-old milk cow sold for $125, several others for $200 and over, and weaning calves sold for as high as $33. Nearly all of the sales were paid for in cash.



Holsteins for Hawaii.

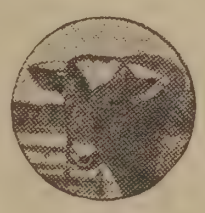
The purchase of 20 head of registered Holsteins from the Carnation Farms in King county by Dr. Hobert Hind, a plantation owner of the Hawaaian Islands, is an indication of the reputation that Washington dairy stock has established in the country. Dr. Hind visited the United States with a commission from a number of friends and business associates to purchase registred Holsteins.

Famous Bull Dies.

The Shorthorn bull, Royal Master Donald, has died at Buenos Aires. He was sold there at auction for 55,000 Argentine dollars (about $22,200). The conditions ruling are that all animals sold must be handed over to their purchaser sound and free from disease. He was attacked by "aftosa," and this prevented the bull being accepted by his buyer.

A WINNING GUERNSEY.

The above photo shows the Guernsey 2-year-old cow, Algoma of Chicona, owned by A. L. Gile of Chinook, Wash., as she appeared to a Farmer staff artist shortly after winning first in her class and senior and grand championship at the Pacific International Stock show at North Portland, Ore., December 4-9, 1916. Along with her other good points, Algoma of Chicona has a sweet, almost perfect head, something not always found on a Guernsey cow. She is a good producer as well as a show animal and will in time be given an official record.



Mr. Gile has a large working herd on his Chicona farm at Chinook and most of his cows have advanced registry records.

Teach Art of Milking.

Rubber models of essential parts of cows have been invented in England to give girls who are learning to be milkmaids practical instruction.

The Light Four
5 Passenger Touring
$665
f.o.b. Toledo

Overland
TRADE MARK REG.

A Complete Line of Automobiles
All New Values

From your point of view this announcement is most important.

For herein we set forth the achievement toward which this company has aimed for the last eight years.

This achievement in a word is the completion of our gigantic organization to a point where we could make and market a complete line of automobiles under one head.

One executive organization,
—*one* factory management,
—*one* purchasing unit,
—*one* sales expense,
—*one* group of dealers,
plan, produce and sell the entire line.

Buying power is concentrated. Costs are distributed over all these cars. The savings are tremendous.

As a result we are producing cars of exceptional quality—and marketing them at unusually low prices.

Every car is built to a rigid standard of performance, comfort and appearance.

The new Light Four at $665 is a striking example.

It has good style—built low with harmonious and full sweeping body lines. It is a beautiful car in every sense of the word.

The motor is powerful, quiet and of sturdy construction. The turning radius is short. The car has a quick acceleration and is built to tour safely and comfortably from the Atlantic to the Pacific.

And with all these good qualities *it rides beautifully.* The soft cushions, the long resilient cantilever rear springs, the large tires (31x4) and the proper balance in construction absorb all types of jolts—the choppy cobblestone, the cuppy macadam and the heavy ruts and thank-you-ma'ams of American highways.

Yet this is but one of the new Willys-Overland values.

Never before have the economies of vast production been available for buyers of every class of car.

And the Overland Policy of greater production, higher quality, lower price is exemplified in every model and type.

Two Passenger Roadster
Light Four, 104 in. wheelbase; $650

THE WASHINGTON FARMER

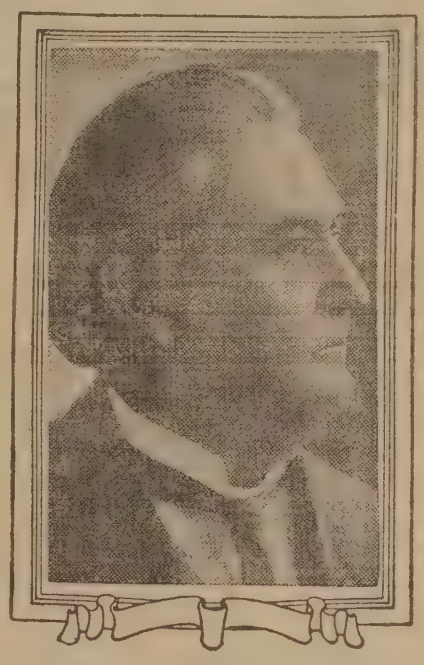
SUCCESSOR TO
THE RANCH PACIFIC DAIRYMAN HORN AND HOOF

VOL. XL. JANUARY 18, 1917. ** NO. 3.

Lister Urges Absolute Prohibition Law

Asks Legislature to Prohibit Even Shipment of Liquor Into State of Washington

"I feel that our state ought to follow the lines adopted by the adjoining states of Oregon and Idaho, and its legislature pass a bill that will also make it illegal to import intoxicating liquors into the state. The benefit to the people is so apparent that I believe you will be acting wisely if you enact into law at this time a measure that will bring about absolute prohibition in the state."—From the governor's third biennial message.



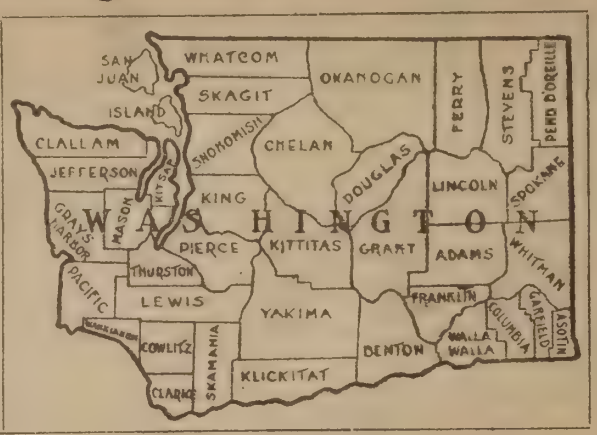
Governor Ernest Lister, shown above, has just begun his second term as chief executive. He is the only governor of Washington, other than John R. Rogers, who has ever been reelected.

This from the message of Governor Ernest Lister to the state legislature, together with two additional facts—that the legislature had already adopted almost unanimously a resolution asking congress to pass a nation-wide prohibition act, and that since that time a bill prohibiting intoxicants in this state absolutely has been introduced—indicates what may be expected of the Washington lawmakes this year on liquor matters. Indications point to the passage of a "bone dry" measure, which would place all three of the far northwestern states under absolute prohibition, Idaho and Oregon having already such laws.

Smaller Legislature.

Governor Lister also recommended that the legislature consider a reduction in its membership, suggesting that one house of 25 members might serve the needs of the state as well as the two houses of a total of 139 members do now.

He repeated his recommendation of two years ago that the legislature call a constitutional convention to revise thoroughly the present state constitution. Among his other recommendations are: That no new state highways be established until the present system is completed; that 25 per cent of the automobile license money collected be turned into the state highway fund to be used in repairing and maintaining highways already constructed; that the rate of interest on delinquent taxes be reduced from 15 per cent to 12 per cent; that the state militia be made smaller and more efficient rather than larger; that appropriations be held down to the lowest possible point consistent with proper conduct of the state's affairs; that the state tax commissioner be reduced from three members to one; that the governor be given greater power in deciding what appropriations of money should be made for the maintenance of the state government and be held correspondingly more responsible.



Lieutenant Governor Hart, the regular presiding officer of the Washington senate. He is a republican presiding over a body strongly of the same party. Both houses of the legislature have republican majorities.

Guy E. Kelly, republican, who was chosen speaker of the Washington house of representatives unanimously.

Are Building Cement Barns

Grant County Farmers Have Lower Parts of Barns Made of Cement to Protect Their Live Stock in All Kinds of Weather

Are Building Barns.

EPHRATA, Grant County, Wash., Jan. 11.—A number of farmers have built rather extensive barns the last fall; most of these barns have the lower part made of cement, built high enough for the stock, the upper part of the barn being constructed of wood. The high price of wheat the last two years has enabled the farmers to put in better farm buildings and to equip them with modern machinery. Every indication points to a large increase in the number of silos another year, as the dairying industry seems to be on the increase, as the grass stays green only a short time in the spring and silage is needed to help hold the flow of milk.

There has been practically no fall wheat sown in this county, as there was not enough moisture in the fall to get it up. H. W. REAUGH.

Cranberries Increase.

SOUTH BEND, Pacific County, Wash., Jan. 8.—Some farmers are planning to raise more potatoes next year; the present price is 2 1-4 cents a pound. There will be more silos built next year and this will increase the crop for ensilage. The growing of cranberries is increasing, also. We need better roads in our rural districts, although they are improving every year. We have had very little cold weather or snow. This county grows very little grain. Rye is up and green. Fuel is scarce. The county agriculturist, H. C. Wilcox, has arranged for a series of lectures to be given later in the month at four different towns in the county. The topics for discussion will be those of interest to the farmer.

MRS. WINNIFRED BUCKINGHAM.

Stock Winter Well.

STEVENSON, Skamania County, Wash., Jan. 7.—We have been having ideal winter weather so far, with plenty of rain, although everything is at a standstill at present on account of the rain and soft roads. Stock is wintering well. W. T. JACKSON.

Poultry Increase.

GIG HARBOR, Pierce County, Wash., Jan. 1.—The most marked increase in any one line of production among the small ranchers of this district is found in the line of poultry production—mainly for egg production. Even in these days of high-priced feeds, it remains fairly profitable. It is an industry that does not necessitate much team work and calls for no heavy transportation charges. It is the one steadily growing industry that offers a generous margin of profit to the careful and painstaking attendant. It is quite evident that this can never become a grain growing region. I do not know of a threshing machine on this side of the water. While a considerable quantity of oat hay is grown here and some other grains are allowed to ripen to be fed in the bundle, we can hardly signify this with the term of grain-growing.

Perhaps the most glaring lack in the lines of farm production is found in that of hay. While it is possible to raise excellent crops of clovers and vetches, our small ranchers are still buying heavily of the alfalfa and other feeds from the counties east of the Cascades. There is a slow but steady opening up of new ranches and enlarging of old ones. With the completion of the new ferry project this extension will no doubt be greatly accelerated.

W. D. BOYNTON.

Large Bean Acreage.

GILBERT, Clearwater County, Idaho, Jan. 6.—The farmers of this section are making a strong effort to raise better stock and do away with scrubs. The Shorthorn and Red Polled cattle are the leaders, as they are a good dual breed. There will be a considerable increase in the production of beans in this locality the coming season, due to the big price received last year, and good prospects for a higher price the coming year. Every available foot of tillable land will be planted to beans and grain. The most noticeable improvement in this community is the drilling for water on the farms. Several have been drilled, with the result that excellent water with a flow of two to three gallons per minute, at a depth of from 150 to 200 feet has been obtained. There have been many barns and silos built during the past year. Fall grain is not being damaged any at the present time, as it is sheltered by the covering of snow.

W. S. CUNNINGHAM.

Winter in California.

LEWISTON, Nez Perce County, Idaho, Jan. 5.—Many cattle have been shipped and on account of the high price of grain, very few hogs are left in the country. A great many of the farmers are spending the winter in California or Florida. No new buildings are being put up and but very few will be built the coming season, and as far as I know, no new silos. Automobile people seem to be about the only concerns that are interesting the farmer in this part of the country. Practically every farmer has now purchased a machine. We have had considerable snow the past 30 days; anywhere from 6 to 18 inches. This is a great benefit to fall grain, in view of the fact that the ground was not frozen since the snow fell. Practically all the moisture will soak in. W. J. JORDAN.

Are Building.

FERDINAND, Idaho County, Idaho, Jan. 6.—There is no noticeable increase in any one branch of farming. Dairying is very little carried on here. There are very few improvements made in this farm community; only a few barns were built, but the town of Ferdinand is growing constantly, and quite a few houses and barns were erected this winter. There are only two silos in existence in this community, and the owners speak well of them. The fall grain is considered to be safe so far, as it is covered with a heavy blanket of snow, but it is too early to pronounce it safe, for now it depends mostly on the weather.

H. W. UHLENKOTT.

Dairy Products Decrease.

WEIPPE, Clearwater County, Idaho, Jan. 9.—This country has increased in all its produce with the exception of dairy products, which are decreasing. Roads are the greatest improvement in this locality. We need the cooperation of the farmers here more than anything else in this community. A number of new buildings and silos were put up last summer. We have very deep snow at this time. C. W. SPACE.

Many Beets in Ground.

PRESTON, Franklin County, Idaho, Jan. 1.—The cold weather started earlier than usual this year. The farmers were not as well prepared as usual. The stock did not suffer to any great extent from the cold. There were several acres of beets left in the ground. Fuel has been rather scarce, but coal is only 50 cents a ton higher than usual. We raise both spring and fall pigs, but the spring pigs do better than the fall pigs, and the farmers, as a rule, sell them on foot. F. T. BENSON.

Stock Men Buy Bonds.

CHALLIS, Custer County, Idaho, Jan. 7.—There is nothing especially new in this district. All the sheep and cattle men have made and are making so much money that they spend their spare time looking for bond investments.

MILTON A. BROWN.

Farm Clubs Plan Plays.

MILES CITY, Custer County, Mont., Dec. 16.—Everybody was ready for the recent cold snap, except the coal men, who seem to have their troubles these days in getting cars. The weather has not been severe enough to cause any suffering of stock. Fall work was cleared away in good shape during the long period of mild weather of November. Very few fall pigs are grown in this county or this end of the state. Breeders generally are not prepared to take care of them, but those that have given attention to fall pigs as a rule have secured very favorable results. A good many farmers dress their own hogs, not so much since local buyers have commenced operating, but this practice usually brought as good or better prices for a limited quantity as selling them on foot. Several carloads of hogs shipped from this point this fall have brought very good prices on eastern markets, ranging from 8 1-2 cents to 9 1-2 cents. The county agent recently visited a number of the farm clubs, attending meetings and holding demonstrations. Several of the clubs are planning home-talent plays, festivals and short courses for the winter months in the way of entertainment.

J. C. TAYLOR.

Thirty Below Zero!

SULA, Ravalli County, Mont., Jan. 1.—The weather here has been cold during the holiday week, the thermometer remaining below zero most of the time, and in many places as low as 30 degrees below zero. All the ranchers are well prepared for the cold spell, however, with abundant fuel and sufficient food and shelter for all stock. Eight carloads of cattle have been sold out of here this fall, at good prices. Stock of all kinds are looking good. While this is a cattle country, there are a few sheep being raised here to good advantage. Some hogs are raised here for market. They are generally killed and dressed on the ranch. We are looking forward to an unusually prosperous season. More fall wheat is in the ground than any previous year, while more plowing and seeding will be done this coming spring than before. W. A. LYMAN.

Railroad Boosts Klamath.

KLAMATH FALLS, Klamath County, Ore., Jan. 8.—Quite a large number of the farmers of this county are stocking their farms with sheep. These farm herds seem to be the salvation of the small farmer. The grain acreage for next year will be increased somewhat, particularly that of oats and barley. There are no silos in Klamath county. Very few dwellings or barns are being erected. The heavy snows of this season protect the fall grain, and as yet no damage has been done. Lack of adequate transportation has been the big drawback to this county. This condition will be remedied in the near future by the building of the Strahorn railroad, which will give the county direct transportation to Portland and eastern markets. The completion of this line will mark the beginning of a new era here.

FRED PETERSON.

Have Open Winter.

CLEM, Gilliam County, Ore., Jan. 8.—Owing to a dry fall, about 90 per cent of the fallowed ground was unsown. The small acreage sown has not been damaged by cold, so far. While there has been some cold weather, the winter has been remarkably open, and live stock is doing well in pastures. Crops have been excellent in this part of the county and the prices good. No great amount of grain is in the hands of the farmers and much that has been sold is still in the warehouses awaiting cars in which to ship it.

S. C. DODSON.

Would Compete With Railroad.

MIKKALO, Gilliam County, Ore., Jan. 8.—There will have to be some reseeding done this spring, as some of the grain that was sown in the dust has rotted. This country needs most, at present, a hard-surfaced road to the Columbia river, which would enable us to put on automobile trucks and get our freight on the river bank, thus saving the high railroad rate which we have to pay. J. B. ASHENFELTER.

Want Meat Producers.

OPAL CITY, Jefferson County, Ore., Jan. 8.—This community is endeavoring to increase its products in every practical way, especially in grain, stock and dairying, also potatoes. More interest is being shown in dairy products, but the general sentiment is fast turning towards a beef strain of cattle and sheep, which will, undoubtedly, be put into effect in a very few years.

D. E. WHITE.

More Live Stock.

CANYON CITY, Grant County, Ore., Jan. 7.—This community is increasing its production in live stock, grain and dairying, raising the best breeds of live stock possible. The farmers are also raising more grain and hay every year. No fall grain was sown last fall on account of the dry weather. If the weather will permit in the spring, there will be more grain sown than ever before. F. M. FISK.

SPRAY!
Grow More Dollars
Don't let bugs, worms, scale and blotch rob you of profits that should be yours. The Deming Spraying Catalog will show you an easy and inexpensive way to guard your crops. New 1917 edition (40 illustrated pages) showing over 25 types, free. Write

FOR GOOD FARMING, ATTRACTIVE COUNTRY HOMES AND HAPPY COUNTRY PEOPLE

THE WASHINGTON FARMER

SUCCESSOR TO

Vol. 40. No. 3 THE RANCH PACIFIC DAIRYMAN HORN AND HOOF January 18, 1917

State Marketing and Packing

Big Question Looms at Olympia and May Overshadow Legislature

Shall the state of Washington engage in the business of marketing and packing the products of its farms, orchards, dairies and packing plants?

That big question looms at Olympia and may become the overshadowing issue of this session.

It springs from a long-standing discontent among the producers of the Puget sound contry with their treatment by the commission houses of Seattle, but it is expected that the farming interests of the entire state will be organized back of the movement, and that it will be supported by the grange, the farmers' union, organized labor and clubwomen and other consumers in the cities, both east and west of the Cascade mountains.

A copy of the proposed bill to put the state into the commission business on a big scale has been received by the Spokane committee that was appointed at the recent city hall massmeeting. It proposes a state marketing commission of three members, to be appointed by the governor, to hold office for six years, and authorized to establish and maintain at least two offices, one in Seattle and the other in Spokane. This commission would have power "to organize, manage, control and carry on the business of receiving on consignment, selling and shipping to dealers and consumers within or without the state of Washington, all agricultural, horticultural, dairy and farm products and products manufactured or processed therefrom, which shall be grown, raised, produced, processed or manufactured within the state of Washington."

It further provides that the commission shall establish and maintain, as its judgment may direct, "receiving and distributing stations for such products and properly equip and provide the same with a sufficient force of officers, clerks and employes."

Other essential features of the measure are thus set forth:

"Said commission shall have power to rent, lease, occupy and use such lands and buildings as may be needed in the business of the commission, including warehouses, packing houses and any other buildings needed, and to use the same in the business of receiving, preserving, packing, selling, marketing, distributing and shipping the produce consigned to it as in this act provided.

"Said commission shall have power to rent, lease, purchase, hold, possess and use all equipment, material, tools, appliances, machines, machinery, horses, mules, trucks, wagons, automobiles and all supplies whatsoever necessary for the prosecution of said business.

"It shall be the duty of the commission to establish and maintain a bureau of information and correspondence for gathering and disseminating statistics and information on all subjects relating to the production, harvesting, storing, preserving, packing, marketing, shipping and distributing of all such products.

"It shall be the duty of the commission to make the business self-supporting as far as possible, and to charge, collect and receive from all producers taking benefit of this act such fees, charges and costs for services rendered by the commission as in its opinion may be just and reasonable.

"There is hereby appropriated out of any money in the state treasury not otherwise appropriated the sum of $100,000 to be used by the commission in establishing and carrying on the business provided by this act."

The commissioners are to give their entire time and exclusive services to the business and give bond in the sum of $50,000.

It is thus seen that the proposed law opens up almost limitless possibilities in the way of state marketing and packing. If the system were successful and farmers employed it extensively, it could grow into a plant representing millions of dollars, handling not only every product of the soil, but engaging in the manufacture of by-products.

That it will be vigorously resisted is a foregone conclusion, not only by commission men in the various cities, but also by firms and individuals engaged in the handling of apples and other fruits, grain buyers and many others whose business might seem to be endangered by the building up of a great state marketing agency.

"One of the shortest cuts to bankruptcy that I know is the raising of beef cattle on a wheat farm. You can't afford to feed a beef animal anything raised on a grain farm that can be sold at present prices."—Thomas T. Kerl, Coeur d'Alene, Idaho.

Alfalfa Records

Idaho Heads Northwest States

According to the crop report of the United States department of agriculture, the alfalfa hay output reached the total of 16,591,000 tons in 1916 as against 19,046,000 tons in 1915. Nebraska produces more alfalfa than any other state, being credited with 2,646,000 tons for the year 1916; then come California, 1,838,000 tons; Kansas, 1,588,000 tons; Colorado, 1,213,000 tons. Of the four states of the Pacific northwest, Idaho leads with 888,000 tons, followed by Montana, 715,000 tons; Washington, 441,000 tons and Oregon, 430,000 tons.

Steelhead Salmon Prices.

Prices for steelhead salmon have opened this season at 9 cents per pound, a higher level than for any previous year, is the report from Hoquiam. The steelhead salmon is a species of trout and is classed among the best food fishes.

Host of Sparrows and Robins.

Seattle reports a host of sparrows and robins speeding northward in dense clouds.

Four Public Markets

Spokane Will Try Out on School Grounds

Starting May 1, 1917, Spokane will try out four public markets on school grounds in four thickly populated residential sections. This plan, proposed by a joint committee of the Spokane county grange, representatives of organized labor and a massmeeting of consumers, has been approved by the Spokane school board and the city commissioners.

To these open markets the producers within hauling distance of the city will be invited to bring their vegetables, fruits, poultry and dairy products, hay and wood, back their wagons up to the curb and deal directly with consumers in the neighborhood. The markets will be free in every sense of the word, and there will be no charge on the farmer.

The committee hopes that the plan will be a success from the start, and is confident that if it has a fair trial the spring and summer months it will flourish in the fall, when consumers can deal directly with the producers for their winer supplies of potatoes, apples and other products.

This method of putting producers and consumers into close and inexpensive contact is said to have succeeded admirably at the national capital. Farmers from the surrounding country bring in their produce and back their wagons up against the curb at the school grounds. Many mothers, market basket on arm, take their small children to school in the morning and make their daily purchases direct from the farmers. Heavier purchases are left for the larger children to carry home after school, and boys take their hand wagons for sacks of potatoes, boxes of apples and vegetables in quantity.

In spokane a committee comprising Dr. J. E. Peterson, representing the grange; T. T. Kilbury, for organized labor, and N. W. Durham, of a committee named at a recent massmeeting of consumers and producers, presented the plan to the city commissioners, and the city government promptly adopted the following resolution:

"The council approves most heartily the plan of setting aside public school grounds and portions of the public streets near these grounds for the purpose of market areas. It will cooperate with the school board and the farmers to successfully establish such public market areas."

It is the desire of the committee that use of these market areas shall be restricted to actual producers, hucksters and middlemen to be excluded. It is expected that farmers will be allowed to bring any product to the markets, including wood, hay, feedstuffs, vegetables and fruits of all descriptions.

Advocates of this system say that it will give the farmers a shorter haul and enable them to market their produce more quickly. For the consumers it offers a nearby market without the time and expense of going to a central establishment.

"It seems to me," said a member of the committee, "that this plan offers an inexpensive method of testing out the question whether the Spokane consumers really want to deal directly with the producers. If they should fail to respond to this opportunity. I should

(Continued on page fourteen.)

Had $10.35 Left

School Puts in a Milk Tester

By U. I. TUCKER, Bossburg, Wash.

The readers of the Washington Farmer who read the account of the trip of the Bossburg school to the county fair will, perhaps, recollect that a balance of $10.35 was left in the school treasury after all expenses were paid.

The faculty and the students thought it a shame to have the money out of circulation. Therefore it was decided to invest part of it. After much argument, pro and con, and consulting of patrons it was decided to buy a Babcock milk tester with a portion of the funds.

The tester, four bottle size, complete and with a quart bottle of sulphuric acid, cost $4.70. In addition to the above outfit, a small pan and a can of separator oil were bought. This made the entire outfit cost $5.35. A quart bottle of acid will test about 27 samples. This makes the cost per cow a very small item.

During three weeks in December we tested 23 cows. We keep a record of each test showing the name of owner, the name of the cow, the test, and the date of the test. No charge is made for testing. The pupils and the patrons are interested in the work and we consider it a big success.

The tester is set up in the principal's room and tests are made every Wednesday and Thursday mornings. The work is given in place of the regular opening exercises. Each grade, from the fifth grade up, takes turns in testing the milk, under the supervision of the principal.

Farm Home in Big Bottom Country

The Big Bottom country in eastern Lewis county is becoming better known since the highway improvements through that district have been completed. This is a wonderfully fertile country well adapted to stock raising, dariying and diversified farming. Now with good roads giving access to markets, rapid development of this country is sure to follow.

The picture shows the farm home of August Snider near Lewis with Mt. Rainier in the distance, Mt. Tatoosh on the right and Mt. Dixon on the left.

Long Time Farm Loans

How They Can Help Out the Man on the Land

By N. W. DURHAM

Chairman Spokane Committe on Federal Land Banks

William Hoppe writes from Gervais, Ore.: "I have read the articles in regard to long time loans on farms. Can I take advantage of the same in my case? I bought 16 acres, well located in the way of school, good roads and other shipping facilities, in an all-around good neighborhood. I bought good land for $125 per acre. Have built a house, barn and other outbuildings, put a fence around it, have planted five acres of loganberries, some raspberries and strawberries, and a small orchard on both sides of the buildings, consisting of prunes, apples and others. I have paid down $350, with 6 per cent interest. It now stands: Principal, $2013; paid down, $350; present indebtedness, $1663. The land is all in cultivation."

Assuming that you have good title, you would be entitled, under the law, to borrow a sum to 50 per cent of the appraised value of your land as you have improved it plus 20 per cent of the value of the permanent insured improvements. If the appraisers found that sum to be equal to your present indebtedness of $1663, you could borrow that amount and pay off the present mortgage.

You say your present interest rate is 6 per cent. That is probably as well as you could do at first under a federal farm loan. The law says not more than 6 per cent may be charged, and it is thought the first loans will be on that rate. In changing, you would have the advantage, though, of a long-time loan—any period from 5 years to 40 years that you might choose, and the further important advantage of whittling down the principal with small annual payments.

Later, after five years, if the government's interest rate should be lowered, you could pay off your first federal farm loan mortgage and make another at the reduced rate of interest.

Authorities who have studied this system in European countries say the long-time feature and the amortization method of gradually wiping out the principal are very popular with farmers over there. They give the borrower, it is said, an ease of mind he can not enjoy when borrowing from private loan agencies, and feeling always the drawing round of the time when he will have to pay off his debt or secure a renewal, which may or may not be given him.

E. A. Beesley writes from Rexburg, Idaho: "I have been following your articles in the Farmer in regard to the federal farm loan banks. Several persons here are interested, and we would like to know if you can give us an outline in regard to the organization of a local farm loan association or other information concerning the same."

Lack of space prevents the Farmer repeating in detail the information sought by Mr. Beesley and his neighbors. By writing directly to the Federal Farm Loan Board, Washington, D. C., they will be supplied with official directions and the necessary blanks for organizing.

FARM LOAN

First Grant County Association.

The first organization of a Farm Loan association in Grant county was perfected at Neppell, Wash., January 6. This organization is to be known as the Moses lake Farm Loan association. The following directors were elected: Will E. Risk, Gloyd; F. M. Reynolds, Gloyd; Donald McDonald, Moses Lake; A. G. Shields, A. L. Pedigrew and Martin Penhallick of Neppell.

The appraisers were Will E. Fisk, A. L. Pedigrew and F. M. Reynolds. A. P. Romine was elected secretary. Nineteen persons applied for loans totaling $49,500.

H. W. Reaugh, county agriculturist, assisted in forming the organization.

The following is a list of members and several more will join later: J. B. Wilby, Jacob Secrest, J. C. White, Will Risk, A. J. Shields, Martin Penhallick, F. M. Reynolds, Fred Gailey, F. E. Lees, A. L. Pedigrew, Reuben Scott, Paul M. Smith, Donald McDonald, A. P. Romine, J. C. Garrison, W. R. Garrison, R. M. Garrison, Lee Houck and E. O. Garrison.

TWENTY FARMERS

Organize Farm Loan Association.

One of the first farm loan associations in the northwest under the new federal law was organized in Eugene. A meeting of 20 farmers of the county, most of them residing in and near Eugene, was held and directors and officers were elected. The directors chosen are George M. Miller, Henry Chezem, H. G. Conrad, Charles Emery, C. J. Schmitt, T. J. Neeley, R. E. Branham, C. C. Goodman and W. J. Scharen.

WITH 90 MEMBERS

Skamania County Association.

The Skamania County National Loan association, with 90 members was organized at Stevenson, Wash., January 6. The following officers were elected: R. E. Turk, Pleasant, president; A. J. Haynes, Underwood, vice president; A. D. Davison, Stevenson, secretary-treasurer, and A. J. Haynes, John Skaar of Stevenson, and J. E. Remion of Skamania on the loan committee. It was a very enthusiastic and energetic meeting. Applications were made for $105,000.

FARM LOAN SOCIETY

Form Organization at Vancouver.

The Clarke County National Farm Loan association has been formally organized at Vancouver. The new organization is to put in application for a loan of $114,500 for the region farm bank to be established in Spokane. William Kennedy, who lives on R. F. D. No. 3, out of this city, has been chosen president; W. D. Sappington of Washougal is vice president and E. J. O'Connell, secretary-treasurer. The trustees chosen were G. B. Clendening, A. L. Rounds, O. Nilson, R. A. Manary, C. K. Cochran, L. H. Strain, John Spurgeon, E. T. Cleary and William Kennedy.

TWENTY FARMERS

Sign for $40,000 Worth of Loans.

O. T. McWhorter, county agricultural agent of Clallam and Jefferson counties, in Washington, reports that the farmers in the country surrounding Port Angeles met at the county agriculturist's office at Port Angeles and made the preliminary step towards the organizing of a farm loan association. Twenty farmers have signed for loans aggregating $40,000. They selected the board of directors as follows: Willis Chambers, president; Dan Kelly, secretary-treasurer; Orin Babcock, Port Angeles; C. N. McLaughlin, Port Angeles; Albert Draper, Port Angeles.

ALMOST $10,000,000

For Roads in Washington State.

Almost $10,000,000 will be spent in the state of Washington this year for good roads purposes, according to figures of county engineers.

Spokane county alone will expend $391,740 for road building and upkeep during 1917. King county will spend $879,000 and Pierce county $452,680.

Nearly a million and a half dollars will be expended through the state permanent highway fund, while the forest roads will receive $91,739 from the state and the same from the forestry bureau.

Fruit By-Products

Must Become Source of Revenue

One of the prominent ideas expressed at the Washington state horticultural convention at North Yakima recently was the need of systematizing and developing the making of by-products from the orchards as something more than a merely incidental source of revenue.

W. H. Paulhamus of Puyallup, where there is located a large cannery and by-products factory, told of the operation and output of the plant and said that there was a movement contemplated for the establishing of similar plants in several other cities of the northwest, including North Yakima, Spokane, Hood River and Wenatchee.

Contract Prices.

He said that the Puyallup plant could now afford to contract for fruit next season at reasonable prices. Bartlett pears, tree ripened, were worth $20 a ton on contract, he said, as were also Elberta peaches. Royal Anne cherries would be contracted at 4 cents a pound. Black raspberries are worth the same.

Mr. Paulhamus said that the Puyallup plant could not supply the orders which it is receiving, and that he was certain there was a good field for other similar plants in the fruit districts.

Dr. J. S. Caldwell of Pullman indorsed the suggestions of Mr. Paulhamus as did others attending the meeting. Dr. Caldwell said that no longer was the by-product problem one of handling cull fruit only, but that it must be extended to take in much of the fruit that, for any cause, does not find ready sale at fair prices on the regular market.

Forest Improvements.

During the last fiscal year there were constructed on the national forests 227 miles of new road, 1975 miles of trails, 2124 miles of telephone line, 89 miles of fire lines, 81 lookout structures, 40 bridges, 222 miles of fence, 545 dwellings, barns and other structures, 17 corrals and 202 water improvements.

Community Development

Depends Largely Upon the Productivity of Soil

In boosting for your community do not overlook the part that soil productivity plays in its development, is the conclusion of Professor W. S. Thornber, director of extension work at the state college of Washington. He considers soil productivity first of seven factors in community development.

1. Productivity of Soil.
2. Market and Transportation Facilities.

7. Pleasant, Comfortable Homes.

Soil productivity very largely governs the land values. A close relationship exists between land values and the class of farmers that move to the community.

A series of crops that will work well into community activities, soil conditions and water supply should be selected. If there is a part of the land that is not adapted to regular crops it should be utilized to the best advantage with pasture crops. Soil fertility must be conserved and the land must constantly be built up and supplied with food for succeeding crops. If the land is in poor condition crops suitable for the community and of improving value to the land should be grown.

The soil is the rock upon which the community stands, and its possibilities for development hinge in a large measure on this factor. Improve the productivity of your soil. Go after any and all help that is available.

Get in touch with your county agricultural agent or your state college at Pullman. Have a profitable rotation of crops planned for your section; get methods of building up land and conserving its value.

Dynamite Plowing

Recommended as Very Practical

By O. P. KOENIG.

Cultivating the soil makes available plant food. It also enables the soil to store more moisture for plant growth. This is accomplished by plowing and harrowing, hence the advantage of deep plowing, that loosens the soil to a greater depth, admits the air and increases its capacity for storing moisture. Deep cultivation of the soil is impracticable around fruit trees as it destroys thousands of those little rootlets and yet trees need the deepest of cultivation.

A recent development of agricultural methods is the use of explosives in this deeper cultivation in orchards. By blasting one can get down in the ground farther and more economically than with machinery.

I have found that the root system of fruit trees in the northwest do not penetrate deep enough into the soil to bring the best results. The roots of fruit trees will not penetrate like the roots of wild trees. I have found that blasting either at the time of planting, or rejuvenating later, the trees will do better as they will get new areas of plant food.

The best method I have found for orchard rejuvenating is to place from one to three shots for every tree, five or six feet from the tree if the trees are of medium or small size. Should the trees be large I place one shot in the center of four trees. When I use three shots to a tree I have these shots very small. I use dynamite about 30 per cent, seven-eighths by eight-inch stick. From one-third to one-half of a stick will be sufficient for a shot. The holes are made at an angle of 45 degrees toward the tree, and three or four feet, seven-eights by eight-inch sticks will go about four sticks to the pound. I use No. 4 cap.

I first make a number of holes about three or four feet deep. I attach cap and fuse to the dynamite stick and drop it into these holes. I use about six inches of fuse as I drop these shots after I light them. The holes should be such that the charge will readily drop to the bottom in which case there is no need of tamping. If the dynamite goes down three of four feet the explosion will shatter the soil sufficiently all around the tree to a depth of eight feet.

The work should be done when the soil is fairly dry or in about the right condition for plowing, the earlier in the spring the better.

For large trees when placing the one shot in the square between every four trees, make the charges somewhat heavier, but it should not be any more than 20 per cent dynamite, as the slow dynamite is necessary in this case, shattering the soil to a greater radius.

All this is based on the principle that plant food lies dormant in the soil without air and moisture; that it is available for trees only as deep as the soil is loosened. The hole in the ground in which trees are planted may be likened to a tub, the roots gaining their food from the quantity of loosened soil; and when only the top soil is loosened, the roots of the tree keep in that loosened soil and have no depth.

It may be repeated that the holes should be made large enough so that the dynamite will easily drop to the bottom.

It will be well to make some test shots to determine the amount of dynamite required. Under no consideration should the explosion throw any dirt whatever. It is advisable to follow carefully the directions which always accompany the dynamite packages.

Kills Timber Wolves.

J. W. Fox, a government hunter near Hoagland, in the headquarters of the Umpqua river, reported to the United States biological survey office at Pendleton, Ore., Monday morning that he has killed five timber wolves during the month. Two were killed in a neighboring locality during October, making a total of seven for the fall. The northwest timber wolf is the most dangerous predatory animal in the west.

Crops With Eight Inches of Rainfall

Four Hundred-Acre Experiment Farm at Cunningham Gives a Handsome Profit During 1916

By THOMAS SHAW

This farm of 400 acres owned by W. W. Haile is located three miles northwest from Cunningham, Wash., on the main line of the Northern Pacific railway. It has been conducted as an experiment farm for the last three years. During two of these years the work was conducted under the auspices of a committee composed of leading business men of Spokane in conjunction with the Northern Pacific railway. The third year it was conducted under the auspices of the Northern Pacific railway. Two of the agricultural men representing that road, namely, E. A. Willson and the writer, counseled with Mr. Haile from time to time as to how the work should be done. The latter did all the work.

Preliminary Work.

The first year the work was largely preliminary and involved considerable expense for the necessary equipment. The second year, which ended September 1, 1915, the farm showed a net revenue of $1770, as stated in the report published in 1915. This did not include $640 allowed as interest at 8 per cent on 400 acres of land, valued at $20 an acre. It is legitimate to include this item in summing up the total net revenue of profit. This, therefore, was $2410. The items of food used and the groceries bought for the farm would about balance each other.

On September 1, 1915, the arrangement made by the Spokane committee terminated. The stock and implements on the farm which were owned by the committee were generously donated by the same to the new experiment farm established not far from Lind. The Northern Pacific retained its relation to the farm in the way indicated above, but made no grant of money in its support. Mr. Haile, therefore, at the date named had to buy all the stock and implements needed, also all the food wanted until such time as food would grow again.

In the inventory submitted at the opening of the farm year, September 1, 1915, these items are submitted at what was paid for them. In that relating to the close of the year, September 1, 1916, they are estimated at what they would bring at the time. The highest priced horses and cattle were set down at the prices offered for them and refused.

The annual precipitation as indicated by the rain gauge on the farm was less than eight inches for the year ending September 1, 1915. For the year ending September 1, 1916, it was just a trifle less than eight inches. The precipitation during the growing months was but 3.70 inches, which fell as follows:

March	1.05 inches
April	1.15 inches
May	.40 inches
June	.75 inches
July	.25 inches
August	.10 inches
	3.70

The experiments thus far have shown:

(1) That the soil can virtually be prevented from blowing if the farmers will cooperate in the work so as to keep their soil on their own land.

(2) That such crops as feterita, milo maize, sudan grass and kafir corn are not greatly serviceable under conditions that prevail at Cunningham.

(3) That the mission of the Lister plow is not greatly important under these conditions.

(4) That corn does not start well when listed, probably from lack of warmth in the furrows.

(5) That much may be done in keeping weeds at bay by the timely use of proper implements.

(6) That live stock can be profitably grown on these lands in the absence of grass pastures.

One of the finest results from the experiments is the outcome from growing live stock. The condition of the live stock at the present time would be a credit to any farm. The food since spring opened has consisted almost entirely of winter rye pasture and such food as can be obtained in the stubble fields. The profits from the stock well managed are excellent and sure. Mr. Haile stated that he would not continue to farm those lands in the absence of live stock.

Financial Statement.

The financial statement for the year is now submitted, and it is as follows:

Inventory, September 1, 1915.

Land, 400 acres at $25 per acre		$10,000.00
Livestock:		
7 head horses and colts	$ 900.00	
29 head cattle	1,110.00	
1 head swine	15.00	
120 head poultry	125.00	
		2,150.00
Machinery, harness, etc.		500.00
Automobile		1,170.00
Seed and feed on hand		1,330.75
Total		$15,150.75

Inventory, September 1, 1916.

Land, 400 acres at $25 per acre		$10,000.00
Livestock:		
7 head horses and colts	$1,125.00	
25 head cattle	1,090.00	
14 head swine	135.00	
125 head poultry	137.50	
		2,487.50
Machinery, harness, etc.		450.00
Automobile		1,100.00
Seed and feed on hand		1,100.00
Total		$15,137.50
Loss or depreciation		$ 13.25

Expenditures, September 1, 1915, to September 1, 1916.

Hired man and day labor	$ 320.00	
Harvesting labor	140.00	
Horse labor hired	75.00	
Rent on 160 acres pasture and horse labor in working same	92.00	
Threshing 3765 bushels wheat at 7 cents a bu.	263.55	
Sacks, 1624 at 13 cents each	211.12	
Miscellaneous expenses	215.00	
		$ 1,316.67
Taxes		85.00
Total		$ 1,401.67

Income or Receipts During Season.

Cattle, 17 head of various ages	$ 815.10	
Cream and butter	198.08	
Pork	40.00	
Poultry and eggs	175.09	
Wheat sold:		
500 bu. at 90 cents	450.00	
1000 bu. at 95 cents	950.00	
260 bu. at $1.25	325.00	
1500 bu. at $1	1,500.00	
		$ 4,453.27
Profit from farm, September 1, 1915, to September 1, 1916		$ 3,051.60
Loss or depreciation		13.25
Gross profit		$ 3,038.35
Interest on investment of $15,150.75 for one year at 8 per cent		1,212.06
Labor income from farm		$ 1,826.29

The grocery bill of $224.68 and the coal bill of $100 have not been included, as the living for the family that came from the farm would more than offset these items. If they are deducted, the profit will be reduced by that much, but in that case the farm should be credited with the food which it furnished for the table, flour, vegetables, milk, butter and eggs.

In the autumn of 1915 the first moisture that fell came as snow, on November 11, which meant that all autumn wheat sown that fall was virtually a failure. The crop grown was Early Bark spring wheat, that averaged approximately 21 bushels to the acre. It would seem fair to claim that the showing made by this farm the last season is highly encouraging when it is called to mind that it is an experiment farm. But it should be clearly understood that the results are to be placed largely to the credit of Mr. Haile and the wife who so loyally helps him.

During the year some hard windstorms occurred. Many farms in the neighborhood blew badly, but little damage was done by blowing on Mr. Haile's farm.

The Faulkner weeder is now rendering good service in preventing blowing on summer-fallow land when properly used. It should be given the attention which its importance demands. Weeds were more in evidence on the farm this year than in previous years, resulting in part from the crop being spring sown and in part from the absence of a suitable weeder.

The experiment work on this farm is by no means completed. The alfalfa and sweet clover crops have not yet proved entirely satisfactory. There is also a time in August and September when the pastures are too dry to meet the needs of milch cows. Corn to be pastured would fill the bill, but it has in the past been difficult to get a stand because of the depredations from mice, which feed on the young plants.

Cooperative Capitalization

Snohomish Association Works Out Finance

By PAUL E. TRIEM

The Snohomish County Fruit Growers' association is now three years old. It is a virile and aggressive organization, with upwards of 300 members. The trustees are Adolph Heck, W. J. Fortune, George Stocker, F. C. Fuchs and E. D. Deselle. Mr. Heck is president, Mr. Stocker, vice president; Mr. Deselle, secretary; and Mr. Martin Hokenstad is treasurer.

The annual meeting of the association, which was held in Snohomish January 9 and 10, was one of those resultful, dynamic gatherings characteristic of the new movement among farmers throughout the county. Talk is talk, but it takes money to finance any manufacturing business— and the farmer is a manufacturer.

Among the practical ideas started into execution at this meeting was one which promises to have a far reaching effect on the entire community. Experience has taught the association the necessity of having some sort of a working capital upon which to finance its buying operations. The man or the corporation with a satisfactory financial rating pays for his goods when he receives them. This means that during the time of transit, his capital is his own to use for other purposes. Without this established rating there is little hope of having an order filled unless it is accompanied with cash. Having learned this important fact by the convincing method of experience, the Snohomish association has set about remedying the difficulty in this way:

Personal Notes.

A note issue totaling $3000 is to be secured by having each member of the association who feels so disposed give his personal note for $25. These notes are withdrawable on 60 days' notice, and are to be used as collateral by the association. With the indorsement of the association, the local banks have expressed a willingness to accept this security.

These individual notes are to be used simply as collateral. When capital is needed the association will borrow as much as is required, giving in turn the usual 90-day commercial note. Interest will be paid on the money so borrowed for the time it is actually at the disposal of the association, and as the majority of operations involving the use of this community capital will be of short duration, it is believed that the interest charge will be low. The main advantage of the plan, indeed, is not so much the availability of this liquid capital, as the fact that the association will be assured a commercial rating, and will be relieved from the necessity of paying in advance for everything.

As an instance of the saving possible by this method, it is pointed out that if alfalfa had been bought last fall at $12 per ton and stored in the port of Seattle warhouse, it would cost, at the time of the annual meeting, about $14.45, interest, storage and insurance included, as against $19 a ton quoted by dealers at this same date. In other words, the community is now paying dealers about $4.50 on every ton of alfalfa, simply to do those things which the association can very well do for itself.

The experiment farm of the State College at Pullman, Wash., is never summerfallowed. Crop rotation is practiced on it so successfully as to prove the uselessness and the waste of a summerfallow system. The part of the farm that has been owned by the college since its foundation has not been summerfallowed for 15 years, and some parts not for 20 or more years.

Artichokes

Writer Likes Them for the Pigs

To the Editor of The Washington Farmer: Artichokes are good pig feed and are the best vegetable for chickens in the winter time to feed raw. One good thing about them is that they will not freeze. They can lay on top of the ground all winter and the frost will not hurt them.

If a pig gets a little grain and has all the artichokes he wants to root out, he will keep in good shape.

Artichokes need rich land. I think they will do well on the logged-off land, as they will grow between the stumps and they do not need any cultivating, and once they are planted, if they are not dug up too closely, will come up year after year.

They grow tops in the spring, and when the dry weather comes they stand still until the wet weather comes in the fall of the year, when they start to grow roots.

They should not be harvested until the middle of November. They keep better in the ground. When dug and kept like potatoes they are likely to rot.

C. L. RAWLINSON.

Spanaway, Pierce County, Wash.

WHEAT COUNTRY

Nearly Half Million Bushels.

The report of R. D. Jarboe, state grain inspector for the period from July 1, 1916, to November 1, 1916, indicates that 422,234 bushels of wheat and 359,774 bushels of oats were placed in the warehouse at Pullman, Armstrong, Busbey, Chambers, Kitzmiller, Sunshine, Staley and Whelan. Of that amount there remained on the latter date in storage 399,874 bushels of wheat. The following amounts of wheat and oats were received at the respective warehouses: Armstrong, wheat, 33,492 bushels; oats, 28,285 bushels; Busbey, wheat, 76,430; oats, 35,317; Chambers, wheat, 103,573; oats, 121,921; Kitzmiller, wheat, 54,366; oats, 13,353; Pullman, wheat, 71,028; oats, 63,666; Staley, wheat, 23,054; oats, 33,810; and Whelan, 35,063; oats, 37,076.

OUR GUARANTEE TO SUBSCRIBERS.

Any subscriber who does not feel that The Washington Farmer is worth to him all and more than the subscription price may order the paper discontinued and the unusued portion of the amount paid for the subscription will be refunded. You must be satisfied.

Entered as second-class matter January 13, 1916, at the postoffice at Spokane, Washington, under the act of March 3, 1879.

GUARANTEE OF ADVERTISEMENTS.

We guarantee every subscriber against loss through dishonesty or swindle by any advertiser in this publication; we do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Complaints must be sent us within 30 days from the date of the transaction, and the subscriber must have mentioned The Washington Farmer when writing the advertiser. This guarantee applies to live stock, except that we will not be responsible for claims for damages on account of disease in stock sold through these columns.

Food for Thought

At a congress in New York of notable economists and men of science some highly instructive facts were brought out that should set to thinking those good people who are agitating the country for an embargo on farm products and boycotts on the farmers' wares.

Milton W. Harrison, secretary of the savings bank section of the American Bankers' association, quoted estimates prepared by Dr. Eliot, the famous ex-president of Harvard, to show that in 1915 the American people spent more money on such things as intoxicating liquors, tobacco, jewelry, chewing gum and similar needless indulgences than they spent on food. The figures were $5,303,000,000 for indulgences and $5.300,000,000 for food.

Indignant massmeetings innumerable have been held to whip up public sentiment for boycotts against turkeys, against butter, against eggs, against potatoes and other farm products. But the farmer has yet to hear of boycotts on tobacco, jewelry and chewing gum, or even a boycott on beer.

A Harvest Festival

The Cashmere Fruit Growers' union held a harvest festival last month. About 250 were present and there was a program of speaking and an enjoyable time.

Years and years ago the country had its forms of social amusement and meeting places. Today it has but few. Towns and cities have monopolized that sort of thing and improved methods of transportation have made it possible for rural people to go to town for their social life.

This is natural enough in the evolution of the times, but it is not altogether good. The farm is the foundation for our nation, and to have a part of its natural life given up and city amusements take its place is injurious to all concerned.

But within the last few years an effort has been made by those who have realized the danger and sought to prevent the consequences to see if we can not build up a country social life adequate to the needs and desires of country people. This will not be based on the country social life of 50 years ago, nor on the city social life of today. It will not leap, full grown, into existence—it must grow into being a little at a time.

Class Affiliation

The labor unions have appropriated that old motto, "United we stand; divided we fall." They realize that in union there is strength. It is very true indeed. If you have a million men demanding one thing, you are apt to get it.

However, isn't it a little bit dangerous to go out of your own occupation to get help? Isn't it apt to have evil effects? Take an example.

The farmers and the American Federation of Labor have worked together on a number of occasions, with a certain amount of success. And yet we see that the federation is strongly supporting an embargo on foodstuffs. An embargo is surely not in the interest of the farmer, nor, do we think, is it right.

And here are our allies urging and fighting for those things which are not for our best good. Why? Because they think it will help them. They should not be blamed for it—it is just human nature. But when farmers join hands with another class entirely they run the danger of having allies who will sooner or later turn traitor.

Our Beef Supply

In 1910 the first cry about our diminishing beef resources arose, and it has been sounding ever since then. Those who were most exercised about it suggested various solutions of the difficulty, among them being that famous one that every farmer should raise two steers.

This is idle talk. To begin with, we know of no figures which are dependable on the number of beef cattle in the United States. The government statistics are based on estimates, except in census years. Outside of an actual count there is no sure way of knowing the amount of beef cattle. Breeders tell us that there is an increased movement in breeding cattle, and this indicates that in a year or two the amount of stuff coming on the market will increase considerably.

However, with range diminishing, with land prices advancing, and with feed high, it is natural that beef cattle will have to bring more or they will not be produced. No farmer is going to produce two or one or any number of steers at a loss.

Treatment for Soil

E. E. Ware, who manages a farm leased by the Oak dairy of Chehalis, quotes his own experience to show the need for individual treatment of Washington farm lands.

"On this heavy, cold bottom land you can see the patches that have been well manured a quarter of a mile away," he says. "The soil is rich enough, but manure opens it up and makes it warmer. When I farmed over near Pasco, on the other hand, I used to find that manure could do as much damage as good if it wasn't managed right. Manure plowed in rather shallowly in the spring would bring the crops up quick and green, but later they seemed to burn easier and to dry out more than those that hadn't had manure. The light, volcanic ash soil we had there didn't need lightening."

Mr. Ware thinks this fact should be more commonly known, and should be emphasized in the literature sent east to prospective settlers.

"They hear about lumber and coal and gold and wheat and oats being produced out here," he explains, "and they get the idea the same piece of ground will produce the whole bunch. Then when they come out here they are disappointed. Farming here isn't like it is in Illinois or Iowa, where a whole section can be handled together."

"Yield Not to Temptation"

One of the greatest temptations that come to human beings is to find fault with other human beings. It is very easy to see their faults and failings, and it is a very human inclination which calls attention to them. It does not mean that we dislike the other fellow when we say that he does not pay his debts, or that his stock is not as good as it ought to be, or that he has been known to indulge in sharp practice. It is that we think these things are so and you can not resist the impulse to tell about it.

Really, there is no justification in doing any of these things. If a man does wrong he should be punished by the proper authorities, but never should he be the victim of sly whisperings and tales told under cover of a promise of secrecy.

First pluck out the mote. Let us be sure we have no fault before we begin to criticize the other fellow.

Keeping Track of Trees

At the last session of the New Zealand legislature an act was passed which authorized the department of agriculture to require every owner or resident on land which contains even one fruit tree to register the same. There is to be no charge for registration, the sole idea being to "keep cases" on fruit trees, to inspect them, to isolate disease, to destroy such as need destruction, and to protect the industry in general. How wise or practical is such legislation is questionable, but it is worth thinking about.

A would-be bridegroom returned his marriage license to the officer who issued it, with these words written across it: "The fuzzy has backed out." That was all the explanation given, but it was sufficient. A life attachment to a man who would call his intended wife a "fuzzy," even after she had rejected him, probably would not be any too pleasant.

Washington Gleanings

The Grant county commissioners have placed a bounty of $2.50 on all coyotes killed in that county during January.

Whitman college at Walla Walla has received a check for $1200, bequeathed to it from a Celia Thomas of Boston. The college authorities are unable to identify the donor.

State Superintendent Josephine Preston, together with other educators, including the county schoolteachers of Walla Walla, have indorsed military training in the public schools.

James Anest, who lives near Winona, in Whitman county, has been growing tobacco successfully, he reports. He says that the tobacco he grows is better flavored than that which he buys in the stores.

Farmers living west of Pullman are petitioning the city and county to cooperate in building a better road into Pullman from the west. At the present time the road, though well improved, is one of difficult grade.

There is much interest being manifested in the new 640-acre homestead law. Reports from all over the northwest indicate that many thousands of acres are being taken up by new or former homesteaders under the old law.

Pierce county, in which Tacoma is situated, has voted overwhemingly in favor of bonding the county for $2,000,000 to purchase a large tract of land at American lake, near Tacoma, for a site for the army division post as proposed by the war department.

Pend Oreille county has arranged for the services of a county agriculturist for the coming year. Thurston county is also installing an agriculturist after doing without one for a year, owing to failure of the commissioners to make the necessary appropriation.

Delegates to the National Woolgrowers' association convention at Salt Lake this month were: T. J. Drumheller, Dr. Robert Prior, T. H. Smith, Alex. McGee, Anderson brothers, K. O. Kohler, William McGuffir, Angus McPherson, John Smithson and F. M. Rothrock.

For probably the first time in the history of the Washington state legislature, both democrats and republicans caucused together in planning the organization of the senate. It was not until after a strenuous fight by the progressive element among the republicans that the democrats were admitted.

What Others Say.

Wallace's Farmer: Everything has gone up in price.

Hoard's Dairyman: Why don't more farmers keep mules?

Rural New Yorker: The thing to do is to get together now.

Dakota Farmer: Health is a deposit in the bank of nature.

Inland Farmer: Interest grows in the Federal Farm Loan system.

WHEN KNIGHTHOOD WAS IN FLOWER

or, the Love Story of Charles Brandon and Mary Tudor, the King's Sister, and Happening in the Reign of His August Majesty, King Henry the Eighth.

BY EDWIN CASKODEN

Copyright, 1898, The Bobbs-Merril Co.

THE CASKODENS.

We Caskodens take great pride in our ancestry. Some persons, I know, hold all that to be totally un-Solomon-like and the height of vanity, but they, usually, have no ancestors of whom to be proud. The man who does not know who his great-grandfather was, naturally enough would not care what he was. The Caskodens have pride of ancertry because they know both who and what.

Even admitting that it is vanity at all, it is an impersonal sort of failing, which, like the excessive love of country, leans virtueward; for the man who fears to disgrace his ancestors is certainly less likely to disgrace himself. Of course there are a great many excellent persons who can go no further back than papa and mama, who, doubtless, eat and drink and sleep as well, and love as happily, as if they could trace an unbroken lineage clear back to Adam or Noah, or somebody of that sort. Nevertheless, we Caskodens are proud of our ancestry, and expect to remain so to the end of the chapter, regardless of whom it pleases or displeases.

We have a right to be proud, for there is an unbroken male line from William the Conqueror down to the present time. In this lineal list are 14 barons—the title lapsed when Charles I. fell—12 knights of the garter and 47 knights of Bath and other orders. A Caskoden distinguished himself by gallant service under the Great Norman and was given rich English lands and a fair Saxon bride, albeit an unwilling one, as his reward. With this fair, unwilling Saxon bride and her long plait of yellow hair goes a very pretty, pathetic story, which I may tell you at some future time if you take kindly to this. A Caskoden was seneschal to William Rufus, and sat at the rich, half barbaric banquets in the first great hall. Still another was one of the doughty barons who wrested from John the Great Charter, England's declaration of independence; another was high in the councils of Henry V. I have omitted one whom I should not fail to mention: Adjodika Caskoden, who was a member of the dunce parliament of Henry IV., so called because there were no lawyers in it.

It is true that in the time of Edward IV. a Caskoden did stoop to trade, but it was trade of the most dignified, honorable sort; he was a goldsmith, and his guild, as you know, were the bankers and international clearance house for people, king and nobles. Besides, it is stated on good authority that there was a great scandal wherein the goldsmith's wife was mixed up in an intrigue with the noble King Edward; so we learn that even in trade the Caskodens were of honorable position and basked in the smile of their prince. As for myself, I am not one of those who object so much to trade; and I think it contemptible in a man to screw his nose all out of place sneering at it, while enjoying every luxury of life from its profits.

This goldsmith was shrewd enough to turn what some persons might call his ill fortune, in one way, into gain in another. He was one of those happily constituted, thrifty philosophers who hold that even misfortune should not be wasted, and that no evil is so great but the alchemy of common sense can transmute some part of it into good. So he coined the smiles which the king shed upon his wife—he being powerless to prevent, for Edward smiled where he listed, and listed nearly everywhere—into nobles, crowns and pounds sterling, and left a glorious fortune to his son and to his son's son, until about the fourth generation, which was a ripe old age for a fortune, I think. How few of them live beyond the second, and fewer still beyond the third. It was during the third generation of this fortune that the events of the following history occurred.

Now, it has been the custom of the Caskodens for centuries to keep a record of events, as they have happened, both private and public. Some are in the form of diaries and journals like those of Pepys and Evelyn; others in letters like the Pastons; others again in verse and song like Chaucer and the Water Poet; and still others in the more pretentious line of memoir and chronicle. These records we always have kept jealously within our family, thinking it vulgar, like the Pastons, to submit our private affairs to public gaze.

There can, however, be no reason why those parts treating solely of outside matters should be so carefully guarded, and I have determined to choose for publication such portions as do not divulge family secrets nor skeletons, and which really redound to family honor.

For this occasion I have selected from the memoir of my worthy ancestor and namesake, Sir Edwin Caskoden—grandson of the goldsmith, and master of the dance to Henry VIII.—the story of Charles Brandon and Mary Tudor, sister to the king.

This story is so well known to the student of English history that I fear its repetition will lack that zest which attends the development of an unforeseen denouement. But it is of so great interest, and is so full, in its sweet, fierce manifestation, of the one thing insoluble by time, Love, that I will nevertheless rewrite it from old Sir Edwin's memoir. Not so much as an historical narrative, although I fear a little history will creep in, despite me, but simply as a picture of that olden long ago, which, try as we will to put aside the hazy, many-folded curtain of

A discovery that he cheated.

time, still retains its shadowy lack of sharp detail, toning down and mellowing the hard aspect of real life—harder and more unromantic even than our own—into the blending softness of an exquisite mirage.

I might give you the exact words in which Sir Edwin wrote, and shall now and then quote from contemporaneour chronicles in the language of his time, but should I so write it all, I fear the pleasure of perusal would but poorly pay for the trouble, as the English of the Bluff King is almost a foreign tongue to us. I shall, therefore, with a few exceptions, give Sir Edwin's memoir in words, spelling and idiom which his rollicking little old shade will probably repudiate as none of his whatsoever. So, if you happen to find sixteenth century thought hobnobing in the same sentence with nineteenth century English, be not disturbed; I did it: If the little old fellow grows grandiloquent or garrulous at the time—he did that. If you find him growing super-sentimental, remember that sentimentalism was the life-breath of chivalry just then approaching its absurdest climax in the bombastic conscientiousness of Bayard and the whole mental atmosphere laden with its pompous nonesense.

CHAPTER I.

It sometimes happens, Sir Edwin says, that when a woman will she won't, and when she won't she will; but usually in the end the adage holds good. That sentence may not be luminous with meaning, but I will give you an illustration.

I think it was in the spring of 1509, at any rate soon after the death of the "Modern Solomon," as Queen Catherine called her old father-in-law, the late King Henry VII., that his august majesty, Henry VIII., "The Vndubitate Flower and very Heire of both the sayd Linages," came to the throne of England, and tendered me the honorable position of Master of the Dance at his sumptuous court.

As to "worldly goods," as some of the new religionists call wealth, I was very comfortably off; having inherited from my father, one of the counselors of Henry VII., a very competent fortune indeed. How my worthy father contrived to save from the greedy hand of that rich old miser so great a fortune, I am sure I can not tell. He was the only man of my knowledge who did it; for the old king had a reach as long as the kingdom, and, upon one pretext or another, appropriated to himself everything on which he could lay his hands. My father, however, was himself pretty shrewed at money matters, having inherited along with his fortune a rare knack for keeping it. His father was a goldsmith in the time of King Edward, and enjoyed the marked favor of that puissant prince.

Being thus in a position of affluence I cared nothing for the fact that little or no emolument went with the office; it was the honor which delighted me. Besides, I was thereby an inmate of the king's palace, and brought into intimate relations with the court, and, above all, with the finest ladies of the land—the best company a man can keep, since it ennobles his mind with better thoughts, purifies his heart with cleaner motives, and makes him gentle without detracting from his strength. It was an office any lord of the kingdom might have been proud to hold.

Now, some four or five years after my induction to said honorable office, there same to court news of a terrible duel fought down in Suffolk, out of which only one of the four combatants had come alive—two, rather, but one of them was in a condition worse than death. The first survivor was a son of Sir William Brandon, and the second was a man called Sir Adam Judson. The story went that young Brandon, and his eldest brother, both just home from the continental wars, had met Judson at an Ipswich inn, where there had been considerable gambling among them. Judson had won from the brothers quite a large sum of money which they had brought home; for, notwithstanding their youth, the elder being but 26 and the younger about 24 years of age, they had gained great honor and considerable profit in the wars, especially the younger, whose name was Charles.

It is a little hard to fight for money and then lose it by a single spot upon the die, but such is the fate of him who plays, and a philosopher will swallow his ill luck and take to fighting for more. The Brandons could have done this easily enough, especially Charles, who was an offhand philosopher, rather fond of a good-humored fight, had it not been that in the course of play one evening the secret of Judson's winning had been disclosed by a discovery that he cheated. The Brandons waited until they were sure, and then trouble began, which resulted in a duel on the second morning following.

This Judson was a Scotch gentleman of whom very little was known, except that he was counted the most deadly and most cruel duelist of the time. He was called the "Walking Death," and it is said took pride in the appellation. He claimed to have fought 87 duels, in which he had killed 75 men, and it was considered certain death to meet him. I got the story of the duel afterwards from Brandon as I give it here.

John was the elder brother, and when the challenge came was entitled to fight first; a birthright out of which Charles tried in vain to talk him. The brothers told their father, Sir William Brandon, and at the appointed time father and sons repaired to the place of meeting, where they found Judson and his two seconds ready for the fight.

Sir William was still a vigorous man, with few equals in sword play, and the sons, especially the younger, were better men and more skilful than their father had ever been, yet they felt that this duel meant certain death, so great was Judson's fame for skill and cruelty. Notwithstanding they were so handicapped with this feeling of impending evil, they met their duty without a tremor; for the motto of their house was, "Malo Mori Quam Fedrai."

It was a misty morning in March. Brandon has told me since, that when his elder brother took his stand, it was at once manifest that he was Judson's superior, both in strength and skill, but after a few strokes the brother's blade bent double and broke off short at the hilt when it should have gone home. Thereupon, Judson, with a malignant smile of triumph, deliberately selected his opponent's heart and pierced it with his sword, giving the blade a twist as he drew it out in order to cut and mutilate the more.

In an instant Sir William's doublet was off, and he was in his dead son's tracks, ready to avenge him or die. Again the thrust which should have killed broke the sword, and the father died as the son had died.

After this, came young Charles, expecting, but, so great was his strong heart, not one whit fearing, to lie beside his dead father and brother. He knew he was the superior of both in strength and skill, and his knowledge of men and the noble art told him they had each been the superior of Judson; but the fellow's hand seemed to be the hand of death. An opening came through Judson's unskilful play, which gave young Brandon an opportunity for a thrust to kill, but his blade, like his father's and brothers', bent double without penetrating. Unlike the others, however, it did not break, and the thrust revealed the fact that Judson's skill as a duelist lay in a shirt of mail which it was useless to try to pierce. Aware of this, Brandon knew that victory was his, and that soon he would have avenged the murders that had gone before. He saw that his adversary was strong neither in wind nor arm, and had not the skill to penetrate his guard in a week's trying, so he determined to fight on the defensive until Judson's strength should wane, and then kill him when and how he chose.

After a time Judson began to breathe hard and his thrusts to lack force.

"Boy, I would spare you," he said; "I have killed enough of your tribe; put up your sword and call it quits."

Young Brandon replied: "Stand your ground, you coward; you will be a dead man as soon as you grow a little weaker; if you try to run I will thrust you through the neck as I would a cur. Listen how you snort. I shall soon have you; you are almost gone. You would spare me, would you? I could preach a sermon or dance a hornpipe while I am killing you. I will not break my sword against your coat of mail, but will wait until you fall from weakness and then—. Fight, you bloodhound!"

Judson was pale from exhaustion, and his breath was coming in gasps as he tried to keep the merciless sword from his throat. At last, by a dexterous twist of his blade, Brandon sent Judson's sword flying 30 feet away. The fellow started to run, but turned and fell upon his knees to beg for life. Brandon's reply was a flashing circle of steel, and his sword point cut lengthwise through Judson's eyes and the bridge of his nose, leaving him sightless and hideous for life. A revenge compared to which death would have been merciful.

The duel created quite a sensation throughout the kingdom, for, although little was known as to who Judson was, his fame as a duelist was as broad as the land. He had been at court upon several occasions and, at one time, upon the king's birthday, had fought in the royal lists. So the matter came in for its share of consideration by king and courtiers, and young Brandon became a person of interest. He became still more so when some gentlemen who had served with him in the continental wars told the court of his daring and bravery, and related stories of deeds at arms worthy of the best knight in Christendom.

He had an uncle at the court, Sir Thomas Brandon, the king's Master of Horse, who thought it a good opportunity to put his nephew forward and let him take his chance at winning royal favor. The uncle broached the subject to the king, with favorable issue, and Charles Brandon, led by the hand of fate, came to London Court, where that same fate had in keeping for him events such as seldom fall to the lot of man.

CHAPTER II.

When we learned that Brandon was coming to court every one believed he would soon gain the king's favor. How much that would amount to none

(Continued on the following page.)

Big Expense of Milk Distribution

Eats Up More Than Five of Nine Cents Paid by New York Consumer

The Wicks legislative committee appointed by Governor Whitman of New York to investigate the dairy industry in that state had its auditors analyze the books of the big distributors in New York City, in an effort to learn how the consumers' money is divided. The auditors' figures tend to bear out the contention of the distributors that the expenses of distribution eat up a large part of the 9 cents paid for a quart of milk by the average city consumer.

According to this analysis a little more than 6 cents goes to the producer and for delivery costs, and the remaining 3 cents is largely eaten up by country and city hauling, pasteurization, bottling, freight charges and overhead expenses. Here are the figures as turned in by the official auditors to the Wicks committee:

Paid producer	3.797c
Country hauling	.297c
City hauling	.294c
Pasteurization	.370c
Bottling	.241c
Delivery	3.384c
Freight charges	.934c
Administration, overhead and advertising	.319c
Total	8.636c
Profit per quart	.364c
Retail price	9.000c

The committee discussed the possibility of selling milk to New York's population solely through grocers and delicatessen stores. This would eliminate much of the expense of the present system of distribution and might result in a cheaper price for the consumer.

George W. Ward, counsel to the committee, intimated that the state would "go into the milk business" after the investigation.

Loton Horton, president of one of the large distributors, held up a pasteboard cap for a milk bottle and said:

"See this? How much do you think that has gone up in cost in the last nine months? We pay $13,000 more now.

"Many persons use milk drivers as alarm clocks. They ask our drivers to come at a certain hour, knock on the

When Knighthood Was in Flower

BY EDWIN CASKODEN

(Continued from the preceding page.)

could tell, as the king's favorites were of many sorts and taken from all conditions of men. There was Master Wolsey, a butcher's son, whom he had first made almoner, then chief counselor and Bishop of Lincoln, soon to be Bishop of York, and cardinal of the holy Roman church.

From the other extreme of life came young Thomas, Lord Howard, heir to the Earl of Surrey, and my lord of Buckingham, premier peer of the realm. Then sometimes would the king take a yeoman of the guard and make him his companion in jousts and tournaments, solely because of his brawn and bone. There were others whom he kept close by him in the palace because of their wit and the entertainment they furnished; of which class was I, and, I flatter myself, no mean member.

To begin with, being in no way dependent on the king for money, I never drew a farthing from the royal treasury. This, you may be sure, did me no harm, for although the king sometimes delighted to give, he always hated to pay. There were other good reasons, too, why I should be a favorite with the king. Without meaning to be vain I think I may presume to say, with perfect truth, that my conversation and manners were far more pleasing and polished than were usual at that day in England, for I made it a point to spend several weeks each year in the noble French capital, the home and center of good breeding and politeness.

How Brandon Came to Court.

My appointment as master of the dance, I am sure, was owing entirely to my manner. My brother, the baron, who stood high with the king, was not friendly toward me because my father had seen fit to bequeath me so good a competency in place of giving it all to the first-born and leaving me dependent upon the tender mercies of an elder brother. So I had no help from him nor any one else. I was quite small of stature—that is lengthwise—and, therefore, unable to compete with lance and mace with bulkier men; but I would bet with any man, of any size, on any game, at any place and time, in any amount, and if I do say it, who perhaps should not, basked in the light of many a fair smile which larger men had sighed for in vain.

I did not know when Brandon first came to London. We had all remained in Greenwich while the king went up to Westminster to waste his time with matters of state and quarrel with the parliament, then sitting, over the amount of certain subsidies.

Mary, the king's sister, then some 18 or 19 years of age, a perfect bud, just blossoming into a perfect flower, had gone over to Windsor on a visit to her elder sister, Margaret of Scotland, and the palace was dull enough. Brandon, it seems, had been presented to Henry during this time, at Westminster, and had, to some extent at least, become a favorite before I met him. The first time I saw him was at a joust given by the king at Westminster in celebration of the fact that he had coaxed a good round subsidy out of parliament.

The queen and her ladies had been invited over, and it was known that Mary would be down from Windsor and come home with the king and the court to Greenwich when we should return. So we all went over to Westminster the night before the jousts, and were up bright and early next morning to see all that was to be seen.

[Here the editor sees fit to substitute a description of this tournament taken from the quaint old chronicler, Hall.]

"The morrow beyng after dynner, at tyme conuenenient, the quene with her ladyes repaired to see the Iustes, the trompettes blewe vp, and in came many a noble man and gentlema, rychely appeareiled, takynge vp thir horses, after whome folowed certayne lordes appareiled, they and thir horses, in cloth of golde and russet and tynsell; knyghtes in cloth of golde and russet veluet. And a greate nomber of gentlemen on fote, in russet satyn and yealow, and yomen in russet damaske and yealow, all the nether parte of euery mans hosen skarlet and yealow cappes.

Then came the kynge vnder a pauilion of golde and purpul veluet embroudered, the compass of the pauilion about, and valenced with a flat, gold beaten in wyre, with an imperiall croune in the top, of fyne golde, his bases and trapper of cloth of golde,

"Have I the honor to find the Princess?"

fretted with damask golde, the trapper pedant to the tail. A crane and chafron of stele, in the front of the chafro was a goddly plume set full of musers or trimbling spangles of golde. After folowed his three tydes, euery of them vnder a pauilion of crymosyn damaske & purple. The nomber of gentlemen and yomen a fote, appareiled in russet and yealow was clxviii. Then next these pauilions came xii. chyldren of honor, sitting euery one of them on a greate courser, rychely trapped and embroudered in seuerall deuises and facions, where lacked neither brouderies nor goldsmythes work, so that euery chyld and horse in deuice and fascion was contrary to the other, which was goodly to beholde.

"Then on the counter parte entered a straunger, fyrst on horseback in a long robe of russet satyne, like a recluse or a religious, and his horse trapped in the same sewte, without dromme or noyse of mynstrelsye, putting a byll of peticion to the quene, the effect whereof was, that if it would please her to license hym to runne in her presence he would do it gladly, and if not, then he would departe as he came. After his request was graunted, then he put off hys sayd habyte and was armed at all peces with ryche bases & horse, also rychely trapped, and so did runne his horse to the tylte end, where dieurs men on fote appareiled in russet satyn awaited on him. Thereupon the heraulds cryed an Oyez! and the grownd shoke with the trompe of rushynge stedes. Wonder it were to write of the dedes of armes that day toke place, where a man might haue seen many a horse raysed on highe with galop, turne and stoppe, maruaylous to behold. C. xiv. staves were broke the kynge being lusty he and the straunger toke the prices."

When the queen had given the stranger permission to run, and as he moved away there was a great clapping of hands and waving of trophies among the ladies, for he was of such noble mien and comely face as to attract the gaze of every one away from even the glittering person of his majesty the king.

His hair, worn in its natural length, fell in brown curls back from his forehead almost to the shoulder, a style just then new even in France. His eyes were a deep blue, and his complexion, though browned by exposure, held a tinge of beauty which the sun could not mar and a girl might envy. He wore neither mustachio nor beard, as men now disfigure their faces—since Francis I. took a scar on his chin—and his clear cut profile, dilating nostrils and mobile, though firm-set mouth gave pleasing assurance of tenderness, gentleness, daring and strength.

I was standing near the queen, who called to me: "Who is the handsome stranger that so gracefully asked our license to run?"

"I can not inform your majesty. I never saw him until now. He is the goodliest knight I have ever beheld."

"That he is," replied the queen; "and we should like very much to know him. Should we not, ladies?" There was a chorus of assent from a dozen voices, and I promised, after the running, to learn all about him and report.

It was at this point the heralds cried their "Oyes," and our conversation was at an end for the time.

As to height, the stranger was full six feet, with ample evidence of muscle, though no great bulk. He was grace itself, and the king afterwards said he had never seen such strength of arm and skill in the use of the lance—a sure harbinger of favor, if not of fortune, for the possessor.

After the jousting the Princess Mary asked me if I could yet give her an account of the stranger; and as I could not, she went to the king.

I heard her inquire:

"Who was your companian, brother?"

"That is a secret, sister. You will find out soon enough, and will be falling in love with him, no doubt. I have always looked upon you as full of trouble for me in that line; you will not so much as glance at any one I choose for you, but I suppose would be ready enough with your smiles for some one I should not want."

"Is the stranger one whom you would not want?" asked Mary, with a dimpling smile and a flash of her brown eyes.

"He most certainly is," returned the king.

"Then I will fall in love with him at once. In fact, I don't know but I have already."

"Oh, I have no doubt of that; if I wanted him, he might be Apollo himself and you would have none of him." King Henry had been compelled to refuse several very advantageous alliances because this fair, coaxing, self-willed sister would not consent to be a part of the moving consideration.

"But can you not tell me who he is,

Read Over Programs and Ads

By Granville Lowther.

At the time of this writing the members of the Washington State Horticultural association are assembling to discuss some of the most important questions that have recently come before them. I am writing this not as an item of news, for before this reaches our readers the convention will have adjourned, I give it in order to show what subjects are considered by the growers of the northwest to be of vital interest to their industry.

If a man would keep step with the march of progress he must know what others are thinking. For this reason I study the programs of the different state conventions in the United States and in Canada. I read their year books and their reports. I read the bulletins of other experiment stations in order to know what the professors are discovering and thinking, and while much of it is not adapted to our conditions and therefore not enlightening. I, every now and then, find a nugget that more than pays me for my trouble. In fact, I sometimes take an hour or more to read the advertisements in the papers or magizines. This I do not because I expect to buy the things advertised, although sometimes I do so, but because I can learn what the commercial world is doing and thinking. What they do and think determines in a large degree what I must do and think in order to meet those changes in public sentiment which alone can insure success. Then, too, I read advertisements because in them I find some of the strongest, tersest expressions in the language. For instance, take as an example the following from the last issue of the Washington Farmer:

"Here's where it tells. It isn't a question of sentiment whether or not your cows are in the pink of condition, but it does make a difference in your bank account."

Another: "Gets all the cream, can be cleaned in three minutes, and lasts for 20 years."

Another: "No matter how old the case, how lame the horse, or what other treatment has failed."

Another: "A safe, speedy and positive cure."

Another: "Economical, durable, sensible and efficient."

Another: "Ready go! The contest is on right this very minute! Get into the running at once and rush your count to the contest editor!"

So I might multiply illustrations, but this is enough to show that I think the very best literature of a magazine is often in its advertisements. The shortest, the strongest, the best expressions are studied because it pays.

Now, when I say that a program, which is often thought of as a bare skeleton, is educational, eloquent and bright with hopes of the future, I think our readers will see my viewpoint.

Here are the subjects under discussion:

Report of the committee on transportation and markets.
Report of the committee on membership.
Report of the committee on better rates and shipping facilities.
Report of the committee on legislation.
The first year of the fruitgrowers' agency.
Keep your eye on the ball.
Cutting wisdom teeth and orchard costs.
Relation of the community packing house to the small grower.
Benefits of cold storage to the northwest fruit grower.
Irrigation legislation.
Our feathered orchard friends.
Need of more by-products plants.
Fruit by-products problem.
Nut growing.
Cherry growing.
Apple grade rules for 1917.
Relation of county agriculturist to the farmer.
What the county agriculturist has done for Benton county.
Diversification on a fruit ranch.
Subject selected.
Discarding prejudices and ill-feeling between the growers and others.
Codling moth conditions of 1916.
Spraying apple orchards, special reference to aphis control.
Nicotine sulphate and arsenate lead experiments for controlling codling moth.
Strawberry root weevil and its control.
Home manufacture lime sulphur.
Development of the fruit industry of British Columbia.
Auction system for selling northwest apples.
Why we should not use the auction system for selling northwest apples.
Transportation problems.

GIANT POWDERS
Lift them out

It will pay you to test Giant Farm Powders in competition with any other stumping powder.

In the last year more than 2,000,000 pounds of these Giant Powders were used for stump blasting in Washington and Oregon alone. The users included farmers in every county in both states, the largest lumber and development companies, and the United States Government. They use the Giant brands because they have found that

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

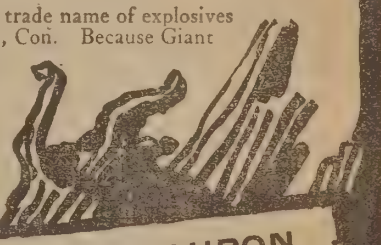
always give satisfaction and do their work at the lowest possible cost and in the most thorough manner.

In the Pacific Coast states the farmers require explosives that will disrupt, crack, split and heave the stumps and at the same time lift and loosen the roots for easy handling. Giant Farm Powders do this because they are made especially to suit western conditions. Because of their wider-spread force, they remove the stumps more economically than powders or dynamites that merely shatter and pulverize.

Test one case. Compare it with any explosive that you have ever used for stump blasting. After you have blasted a dozen stumps you will understand why farmers who have once used them always continue to use the Giant Farm Powders. Fill out and mail the coupon at the right, and we shall arrange with our nearest distributor to supply you promptly at the lowest market price.

There are two Giant Farm Powders—Giant Stumping Powder, used for blasting in wet soil, and Eureka Stumping Powder (which costs a little less) for blasting in dry soil. Both resist cold to a remarkable extent, seven days' exposure to a temperature of 32 degrees failing to freeze them. Ask your dealer for these brands.

THE GIANT POWDER CO., CONSOLIDATED — HOME OFFICE: SAN FRANCISCO — ESTABLISHED 1868



"Everything for Blasting"

BRANCH OFFICES: Seattle, Spokane, Portland, Salt Lake City, Denver

Have You Our Stump Book?

It is the most helpful and interesting book ever issued on Stump Blasting. It tells and shows how to save money and make land-clearing easier. It is written by Western men, from the Western viewpoint, and is full of pictures showing latest methods of blasting. Mark and mail the coupon and get it free. Other books—on boulder blasting, tree planting, ditching and subsoiling with explosives—also free on request. Mail the coupon *now*, before you lay this aside.

Warning. Giant Powder is the trade name of explosives manufactured by the Giant Powder Co., Con. Because Giant Powders are best known everywhere, many have assumed that all high explosives are Giant Powders. Insist upon having the genuine, made only by the Giant Powder Co., Con. If your dealer has only ordinary dynamite, write us and we will see that you get the genuine.

Utility Points

Must Lie Back of Show Points

There may have been a time when the various types and standards by comparison with which an individual animal was judged were fixed by the caprice or personal preference of the judges, but if this was ever so the time is long past. Today there is a practical reason, a utility point, back of every show point demanded. The modern tendancy of judges to explain these utility points is one of the greatest educational factors in connection with our fairs and live stock shows.

A case illustrative of this practice occurred at the recent convention of the Washington State Dairy association, held at Auburn. The stock judging contest, participated in by a group of local school boys, was in charge of Professor William T. McDonald of Victoria, B. C., and after the decisions of the youthful judges had been handed in Professor McDonald went over the animals point by point, and told the crowd which stuck close to his sides just where each animal scored or failed to score.

Brightness, fullness and vivacity of eye was one of the first points touched upon. Illustrating his remarks by referring to the four-footed examples before him, the expert showed that his quality of eye demanded was not merely a show point, but that it was a direct indication of that supreme utility point, vitality. A cow with a lack-luster eye, sunken and half closed, is apt to be decidedly wanting in vitality, and hence in possibilities as a breeder or milk producer.

The texture and "feel" of the animal's hide was the next point touched upon. Not only the thriftiness of the coat, but pliability and motility over the ribs is demanded. Here again, Professor McDonald explained, we have a show point which is also an index of vitality.

Heart girth is another cardinal point in practical judging. The ribs must be well sprung, thus giving lungs and heart sufficient room in which to work to the best advantage.

A straight back is as much an indication of organic integrity and vigor as it is a "beauty line." The sway back colt or heifer is handicapped in the very beginning, and this undesirable trait has a tendancy to increase with the increasing age of the animal.

"Barrel room" is probably of equal importance with heart girth, and is a closely related feature; the animal with plenty of room for the digestive system will be able to stand up under the strain of high production; arrested development either here or in the region which houses lungs and heart is a fatal defect.

These are simply a few of the high lights touched upon by Professor McDonald. It is safe to say that long before he had concluded his talk, many of the crowd of spectators, who had heretofore looked with considerable indifference on the matter of stock judging, had been brought to see that utility is the basis upon which type is determined.

Shipping Chinese Eggs.

Chinese ship fresh eggs long distances in good condition by coating them with a paste made of sea salt, vegetable ashes and water.

Questions

Are Answered by A. B. Nystrom

Is there any remedy for "bitter milk?" My cow will be fresh in about three months and now the milk is getting so strong or bitter that we can not use it. She is in fine shape; is fed on alfalfa hay and bran, has plenty of fresh water and salt, and has a small lot to exercise in and a dandy, warm barn. She gives plenty of milk and it has a good cream. Her milk tasted the same last year at about three months before she was fresh, but never before that that we know of.
W. L. L., Wenatchee.

Regarding the remedy for bitter milk will state that so far as I know there is no absolute remedy. When cows are far advanced in lactation we find that there is often a change in the mineral constituents of the milk that give it a bitter taste. In addition to this we also find that when cows are fed on dry feeds principally, and when there is not a great deal of variety, we often get a change in the composition of the milk which makes it taste bitter.

Aside from this the cow's udder may be diseased, and this will also have a tendency to make the milk taste bitter.

The only suggestion that I could make would be to supply the cow with some succulent feed of some kind. Give her roots, apples, or some silage, if you have it.

It may be that the cow is overfed. In that case, cut down the feed to some extent. I refer to the alfalfa principally. In place of giving her bran alone, give her bran and ground oats, equal parts.

You do not state whether or not the milk is bitter immediately after it is produced, or whether it turns bitter after it stands awhile. If you find that the bitter taste is not present until 12 or 24 hours after the milk has been produced, it is probably due to the presence of organisms that gain entrance to the milk at some time during the production. Under such conditions I would suggest that you thoroughly boil all utensils and strainer cloths after they are used, and be careful to see that the barn is well ventilated.

Ration for Cows in Milk.

Please advise me how to feed dairy cows for milk production with the following feeds: Hay—mixed clover and timothy of good quality, bran, ground hulless barley, oil meal, mangels, and soy bean meal. If necessary I can get other feeds.
C. G. J.
Mt. Vernon.

You should be able to get an excellent ration out of the feed that you have mentioned, and I would suggest that you feed the cow all of the mixed clover and timothy hay that she will eat up clean. Feed also from 30 to 40 pounds of mangels per day, and it is better to cut these up or run them through a beet pulper before feeding. As a grain mixture to supplement this, mix three parts by weight of bran, three of ground barley, and one of soy bean meal. I feel sure that this will give you excellent results, and if you will feed your cows according to production you will be feeding economically. I would suggest that you feed the grain mixture at the rate of one pound of the mixture to three and one-half pounds of average milk. If the cows are giving rich milk, feed one to three, and if the milk is of poor quality, feed one to four.

A GRADE GUERNSEY.

This animal, "Polander," owned by the Montana Agricultural college, produced 14,822 ponnds of milk during the year 1915-16, making 806 pounds of butter. For five years she has averaged 11,490 pounds of milk and 604 pounds of butter.

Big Expense

Of Milk Distribution Is Problem

(Continued from page eight.)

door and wake them up. These people may live next door to one of our stores, could save money by going to the store for milk, but they would rather have the milkman come to the door."

Mr. Horton said he started in the business 46 years ago and was then content to earn $3 a day. Additional capital has made possible a more efficient distribution, he declared.

"But some people say you don't need capital to distribute milk," suggested Mr. Ward, "that the state, for instance, can have the milk come to the city from up the state and sell it from stores."

"Well, I'd like to see them in the milk business," replied Mr. Horton.

Referring to the idea of State Food Commissioner Dillon that the state could go into the milk business, Mr. Horton said:

"Why, I pay $60,000 taxes to the state and I don't want the state to gamble in my money and use it to cut my throat. Taxes are increasing with all those rainbowchasing ideas."

Aaron Sapiro, attorney for the state market commission of California, appeared as a witness, having come from San Francisco to explain the working of his department to the committee. There is now in preparation a state law for California, he said, whereby the state market department will have absolute control of the fish industry of the state.

Mr. Saprio related the experiences of the state of California, which, he said, had reached more advanced results than any other state in the Union. On the basis of past efforts, he said, the future remedy of the situation would be worked out in two directions:

1. Products in every line of food growing are to be organized in separate cooperative associations to grow better products and advertise to maintain prices and increase demand.

2. To have all products from these associations consigned to the state director of food and markets and sold by him at a number of state markets to be established.

Mr. Sapiro, in telling of California's success in state supervision of food distribution, said that each class of producers was organized separately, he said, whereby consumers paid less and fishermen got more money for their product.

"And how long did this last?" asked Judge Ward.

"Until somebody threw a monkey-wrench into the machinery," replied the witness. He explained that one large dealer, jealous of the fact that other dealers were making more money, disrupted the scheme by paying more for fresh fish than the commission.

Charles T. Howe, a dealer in byproducts of milk, said that large quantities of milk are made into casein, which is used extensively by paint manufacturers. It gives the paints a sticking quality. Leather manufacturers, he said, also use casein and a certain extensively advertised patent medicine is made up largely of it.

Chehalis Cow Testing.

For the month of December, the 11th month of testing in the Chehalis District Cow-Testing association, Official Tester W. F. Meyer reports an increased number of cows, 29 in all, on the honor roll. The honor roll includes cows which yielded 40 pounds or more of butterfat during the month.

Two grade Holsteins of the state training school herd head the list for the month, with a grade Holstein from H. W. A. Tramm's herd in third place. All three of these cows yielded more than 60 pounds of butterfat during the month. Nathan Hamilton's Butterfly and Frank Hamilton's Clothilde, both of which have tested high in recent months, are again near the head of the list.

What Is a Hawaiian?

A correspondent inquires whether it is proper to speak of a Hawaiian as a "Kanaka." The term is masculine. A "Kanaka" is a male Hawaiian. A "wahine" is an unmarried Hawaiian woman. A "wahine mare" is a married Hawaiian woman. These definitions are from the Hawaiian dictionary.—Bellingham (Wash.) American-Review.

Raise Your Calves on
Blatchford's Calf Meal
and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves. It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Blatchford Calf Meal Factory, Dept. 58 Waukegan, Ill

Tanning Rabbit Hides

Early Indian Tribes Used a Simple Method

To the Editor of the Farmer: Kindly give me a way of tanning rabbit hides with the fur on; also, for dyeing same from the native color to black and brown. Mrs. C. E. W.

Blitzen, Ore.

In connection with the answer to this question at the State College at Pullman, J. L. Ashlock writes:

"I have always believed that there was some way of tanning a rabbit skin by simple, inexpensive means, and have had the notion that the Indians knew how. I ran onto the very thing I have been looking for for years in an old 1870 report of the Smithsonian institution. It could not be called practical tanning, but I believe it is the very thing a boy who shoots a rabbit wants to know."

The early Indian tribes of North America made use of a method of tanning which for extreme simplicity would be hard to duplicate. This method is described in a report of the Smithsonian institution, for the year 1870, by Titian R. Peale:

"The material used for the preservation of the skins is principally the brains of the animal from which they were taken. While the skins are fresh, or in their green state, they are stretched on the ground and scraped with an instrument of bone or stone, resembling an adze; the adhering portions of flesh are removed, and the surface is then plastered over with brains mixed in some cases with the liver, and on this is poured from time to time warm water in which the meat has been boiled. The whole is then suffered to dry, after which the skin is again subjected to the action of the brain and hot water, further stretched, and, while still wet, scraped and rubbed with stones until perfectly dry. It is further softened by rubbing and passing it backward and forward over a twisted sinew, stretched horizontally. The brain of an animal is sufficient to dress its skin; but in some cases, a less quantity is sufficient for the purpose. I have myself used this process in the preparation of skins, but have found animal brains inferior, as a suring material, to a mixture of saltpeter and alum. The Indian, however, has no choice and makes use of such materials as he can procure, and which probably from accidental discovery and subsequent experience, he has found to produce the desired effect."

Here is William T. Hornaday's recipe for making the salt and alum bath in which to cure skins:

Fore every gallon of water put in three-quarters of a pound of alum (one pint) and a pound and three-quarters of salt (about one quart) and heat the liquid to the boiling point, stirring occasionally, so that the salt and alum will dissolve. Then pour it into a wooden, earthern or glass vessel, or a tank lined with lead (zinc or galvanized iron will not answer), and when it is cool, or even milk warm, it is ready for use."

Immerse the skin in this bath, being sure that it is free from folds. Remember that the fluid must act on the inside of the skin, since the epidermis, or outside, is often impervious to the solution. Two or three days will be sufficient for a large, thick skin. Since rabbit skins are thin a day or perhaps two days of immersion would be sufficient.

Prior to immersion be sure that all meat is scraped from the inside of the skin. Its presence interferes with the action of the fluid.

Another way of curing the skin is to stretch it out, scrape the meat off, and then spread it out on a mass of hardwood ashes in a pan, which has been well moistened. Cover it over with wet hardwood ashes, and leave it there for a couple of days. The hair is then scraped off with a sharp knife. this method does not apply where one desires to keep the hair on.

The ashes or salt and alum bath accomplish only the "curing." After that, begin rubbing it with whatever device you choose, taking the Indian's way if you like. Rub it till it begins to get white and soft. Then roll it up and be careful that it does not get dry before you renew the rubbing and scraping. Tanner's knives or "skiving knives" are sometimes used for this. The rubbing is to break up the tissues of the skin, and must be done either by mechanical means or by hand, after the fashion of the North American Indian.

In dyeing the rabbit fur you could use any good quality dye, following the same general methods one would use in coloring woolen or cotton goods.

American Boot Exports.

Orders for American boots and shoes reaching a total of nearly $50,000 have been taken at Rangoon, Burma, recently by a representative of an American shoe concern. It is expected that this new demand will continue, as the Burmese find it almost impossible at present to get footwear from England, whence they have imported it in the past.

Dairy Barn and Herd of Holsteins

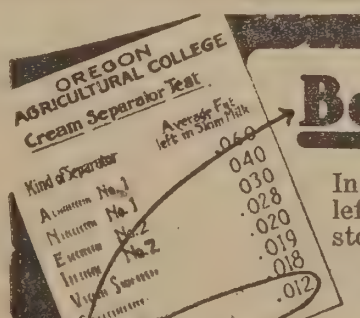
Dairy barn and herd of Holsteins on the P. A. Frakes stock farm, near Scappoose, Ore. The dairy barn on the Frakes place is one of the finest and most up-to-date in Oregon. Mr. Frakes and his son, George Frakes, conduct a business which has grown from humble beginning to considerable size and comfortable profits.

Easy to Turn-Why?

BECAUSE the women-folks can turn as slow as they please, ***and still get all the cream!***—true of no other separator. Most separators have to be turned 55 to 60 turns a minute or they lose cream. But if you want, you can turn a Sharples at only 38 or 40 revolutions per minute and still get a perfect skim—for the wonderful Suction-feed drinks up the milk only as fast as it can perfectly separate it. Again, the bowl hangs from a single frictionless ball-bearing running in a constant bath of oil. That, too, means easy turning. The bowl has no heavy discs in it—little power is required to set it spinning.

SHARPLES
SUCTION-FEED
CREAM SEPARATOR

—is the *only* separator that will skim clean at widely-varying speeds
—is the *only* separator that delivers cream of unchanging thickness—all speeds
—is the *only* separator that you can turn faster and finish skimming quicker
—is the *only* separator that has just *one* piece in the bowl—no discs, easy to clean
—is the *only* separator with knee-low supply tank and a once-a-month oiling system



Made and strongly guaranteed by the largest and oldest separator factory in America. Repair cost is practically nothing—so ruggedly built that many a Sharples has not cost one dollar for repairs in fifteen years. Over a million users—in every dairying country of the world. Send for catalog to Dept. 48.

Live Stock

Industry Is Helped by Shows

By E. J. IDDINGS.

Two remarkable live stock expositions were recently held in the Northwest Live Stock show at Lewiston and the Pacific International Live Stock show at Portland.

Both shows were special purpose events devoted to live stock upbuilding and improvement. Both were educational in nature and purpose, clean and free from fake or objectionable features of any kind. Both were distinctly successful in every way, especially from the point of view of attendance, interest, sales and financial management.

Many visitors who for the first time were this year visitors at Lewiston or Portland at first were at a loss to understand the wonderful interest and enthusiasm manifested without vaudeville, chance games and other fakes or devices for separating people from their money without giving anything substantial in return. Those who first came from suriosity and to be amused later became interested in the things for which these shows stand and remained to learn the lessons of live stock types and breeds, of live stock excellence, of animal breeding and of the essential place occupied by live stock production in any permanent scheme of agriculture.

The Lewiston show is remarkable first of all for the fact that it is staged in a comparatively small city and hundreds of people go there with the single purpose of spending one to six day at the show. Lewiston at show time offers no special entertainment except great and very fine displays of the various types and breeds of animals adapted to the northwestern state, live stock demonstrations, evenings for discussion of the live stock problems and an annual banquet and get-together meeting for live stock men and those interested in live stock improvement.

Method of Financing.

Another remarkable feature of the Northwest Live Stock show is the method of financing it. During the past year no state appropriation, county or city aid of any kind could be had. Some back debts, premiums for 1916 show, expenses of preparing for and staging of the show cost approximately $18,000. This was raised by popular subscription and by sale of annual and life memberships, with the exception of $2500 provided by the Idaho state live stock sanitary board given with the idea of assisting in sanitary features, health of the herds, etc. Approximately 1400 people contributed directly to the financing of the 1916 show and hold membership cards from the association. It is doubtful whether any other live stock association organized for the special purpose of putting on a show has such a large and widespread membership as indicated above.

As in former years there was a great interest in the various student stock judging contests. There were three college teams totaling 15 men in the col-

(Continued on following page.)

New Hog Barn at the Oregon College

By E. L. POTTER

Everything about the building is suitable for farm use.

Twenty-nine farrowing and dividing pens.

There are gates between pens so they may all be thrown together.

The feed may be put in the troughs from the outside without opening any gates.

The windows are so arranged that the maximum sunlight reaches the pens on March 1 and September 1.

Dipping vat is a model for small farm plant and is to be used for sheep as well as pigs.

New pen will be used in connection with the Hog Producers' week at the college January 2-6.

The Oregon Agricultural college has just completed a new hog barn and feed house that is probably the most modern to be found anywhere. Others are more elaborate, are better finished or more expensive, but none accomplish more in the way of providing comfortable and sanitary quarters for the pigs and in reducing the labor of feeding and handling.

While this house was planned especially for the needs of the college, everything about the building is suitable for farm use.

The house contains 29 farrowing pens besides weighing and dividing pens. The pens are eight by ten and have concrete floors and troughs. Each pen is also provided with drainage, although by placing the pens back to back one drain does for two pens. There are gates between pens so that they may all be thrown together. By an ingenious arrangement of the gates, two gates are made to do the work of three besides giving space for six and one-half feet of trough in pens only eight feet wide.

The feed may be put in the troughs from the outside without opening any gates or getting in with the pigs. One concrete water trough supplies two pens and the water is kept at a constant level by a float, one float regulating the water for all the troughs in the building.

The general style of the building is what is known as the Illinois plan. The house stands east and west and all the windows are on the south. The windows are so arranged that the maximum sunlight reaches the pens on March 1 and September 1. A little carrier is provided for, taking out the manure and carrying it direct to the manure pit. The drains are used only in flushing the pens with a hose. To the outside the house connects directly with eight pastures.

The experimental and class work of the college makes it necessary to do a great deal of weighing, separating and handling of the pigs. To facilitate this work dividing and weighing pens are provided so that the pigs may be weighed one at the time without having to drag them around by main strength.

A dipping vat is at a convenient distance from the house. This vat was built with a view to making a model small farm dipping plant and is to be used for sheep as well as pigs. The vat has a concrete drain floor, a settling basin to prevent manure and dirt from the drain floor from entering the vat, and chutes for driving the sheep or pigs into the vat.

A bed room is provided for the attendant. The room is so placed that a window overlooks one entire half of the farrowing pens.

In connection with the hog house is a feed house which will hold grain enough to last the entire year. There are three large storage bins two stories deep. Between these and the hog part is a driveway which also serves as a feed and mixing room. Over this feed room are six small hopper bottom bins of from 170 to 235 bushel capacity.

A simple bucket and belt elevator is placed in the center of the building and by means of a swinging spout in the attic, grain may be moved from any bin to any bin or to or from the scales or grinder. After the grain is emptied out of the wagon it may be elevated into any bin, ground, mixed, weighed and spouted into the feed cart without any manual labor of any kind. It is estimated that the saving in the handling of the grain and feed will pay interest on the investment in both the feed house and the hog barn. The college has had before no convenient place for the storage of feed and have had it piled in sacks in the barns, sheds and haymows.

The department of animal husbandry does not grow much of their grain since they have barely land enough to furnish the pasture. They do, however, buy the grain and hay directly from the neighboring farms and are thus able to get it at the minimum price. The new feed house will make it possible to store and handle this grain at almost no cost. Efficient business-like management has always been the policy of this department and in spite of the fact that a business administration is commonly considered impossible in a public institution and especially in a college, few commercial establishments can boast of getting more work or better work for their money.

This new hog barn will be used in connection with the hog producers' week to be held at the Oregon Agricultural college January 2 to 6. The department will devote all of its attention to hogs during this week and a thorough and interesting program has been prepared. Especial attention will be paid to methods of pork production that will put the hog on a more permanent basis than he is at present. The Oregon Swine Breeders' association will meet at Corvallis during the week. The slogan for the entire five days will be "Not more hogs, but more profit."

Majority Says "Nobody"

Can Raise Horse as Cheaply as the Farmer

Who, if anybody, can raise a colt to maturity more cheaply than a farmer himself?

This is one question which the Farmer asked in its recent questionaire sent to a large number of practical farmers throughout the northwest. Overwhelmingly the reply was "Nobody," but there were frequently replies of this kind with "strings" attached. Several replies are that the range man can do it. Some believe that only the man who makes horse breeding his one principal business, making special preparation for it and special study of it in all its phases, can raise a work horse profitably, and that the common farmer is wiser when he buys from such a breeder rather than raise his own stock.

A Frank Answer.

H. C. Stockwell of Monroe in Western Washington is frank in his reply to the question above quoted. He says: "I don't know, but somebody evidently does."

Some express the opinion that in some sections the farmer can raise his own stock profitably, while other sections must import from the more favored sections.

Charles M. Talmadge of Newport, Wash., answers the question this way: "Range men in Montana, Idaho, Oregon and parts of Washington."

A. L. Rogers of Waterville, Wash., says that nobody can raise the horse more cheaply than the farmer, for "open ranges are a thing of the past."

A Variety of Opinions.

Here are a number of replies received to the question, some of them indicating possibilities and impossibilities in the horse business of the northwest:

Fred Grover, Hillsboro, Ore.—"Small farmers who have only light work for their teams."

W. H. Lytle, Salem, Ore.—"Nobody, unless it be range breeders handling small horses."

Jacob Alchenberger, Middleton, Idaho—"Nobody in the world."

J. H. McCroskey, Fishtrap, Wash.—"The horse breeder."

West Side View Point.

Thomas Carmichael, Gaston, Ore.—"Horses are raised more cheaply in eastern Oregon or Washington."

W. H. Verwe, Mt. Vernon, Wash.—"The only answer to this question is: Another farmer who likes horses."

W. F. Howard, Parma, Idaho—"Only the large breeder on the range."

J. C. Bush, Chehalis, Wash.—"No one. A farmer who knows how not to overwork a colt can get enough work out of him between the ages of 2 and 4 years to pay for raising from birth."

A. R. Hunter, Island City, Ore.—"The farmer who has pasture and raises hay."

A. H. Reppeto, Banks, Ore.—"The man who specializes in that line."

Veterinary

Dr. S. B. Nelson

I have a mare coming four years old with a splint on the inside of her front leg, pretty well forward. It does not seem to hurt her in any way. I have rubbed it and she does not flinch a bit. It is quite hard, feels like a bone would. Would you advise me to do any thing for it or leave it alone?

M. C.

Alderdale, Wash.

A splint is due primarily to an irritation of the ligaments between the large shin bone and the small inside shin bone. There are two or three reasons for this irritation: First, that the inside toe and quarter of the hoof is allowed to grow too long, which throws the ankle out and causes the bearing pressure to come on to the inside small shin or splint bone. In trying to support this extra weight nature throws the new bone tissue out between the two bones. Secondly, sometimes it is due to an insufficient amount of minerals in the food supply.

Treatments which have given the best results are first to level the foot and then take off just a little for a month or two months of the inside toe and quarter so as to throw the ankle in and take the bearing pressure off the inside splint bone. Following this I have frequently seen an animal become perfectly sound.

If there is a great deal of soreness apply a blister of one part of red odide of mercury, one part of powdered cantharides, six parts of lard and one part of beeswax rubbed on the splint, leaving about an eighth of an inch of the ointment on to blister. When the blister comes off paint the splint with tincture of iodine for a week or 10 days, which will frequently entirely remove the lump. About a week or 10 days after the blister has been applied is the time to begin with the tincture of iodine treatment. Of course, some splints will yield just to the tincture of iodine treatment after the foot has been leveled or even slightly taken off on the inside quarter, and it may not be necessary to blister. The blister I have given you will not leave a scar, at least it is very rarely that it leaves a scar, and then it is due to the animal getting its head down to where it can chew the blistered surface.

I would like to know what is good for mange on calves. S. B.

Harrington, Wash.

True mange is due to a small parasite which burrows itself in the skin and one of the good treatments is to wash the calf thoroughly with a lime and sulphur solution. One recommended by the United States government contains 16 pounds of unslaked lime and 21½ pounds of sulphur. Boil the two together after the lime has been slaked in just a little water until it is properly colored, then filter through a sack and add enough water to make a hundred gallons. Use any portion of this quantity that you want to use. Wash the calf all over with this solution and then repeat in five and 11 days. Another treatment is to wash the calf with a 3 per cent solution of any of the coal tar products repeating after five and 11 days.

Live Stock

Industry Is Helped by Shows

(Continued from preceding page.)

lege competition and 115 in various contests for young men and women from secondary and grade schools. Visiting farmers, stockmen and exhibitors followed the young people in their work with a great deal of interest and enthusiasm.

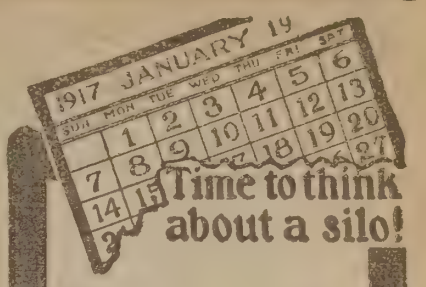
Another interesting and much appreciated feature was a series of parades and live stock demonstrations held at various times during the week. At one time the large tent erected to shelter the night show held a crowd of 2000 people who watched the parade of prize-winning drafters, beef and dairy cattle and listened attentively to the discussion of the various desirable and undesirable points of these animals and seemed to appreciate greatly the discussion of the adaptation of the various types and breeds to the northwest.

More and Better Stock.

Education directed toward more and better live stock on the farms of the northwest was the keynote of the week's exhibition at Lewiston.

The Pacific International at Portland, too, was distinctly educational in nature. The writer passed the entire week at the show and felt most deeply the real genuine aims and purposes of the show there and the influence it is certain to wield on the live stock development of the states contiguous to Oregon.

The sales at Portland were organized for the most part on a breed basis. The swine growers had a joint sale which was regarded as successful as an initial undertaking. Other sales were those of Guernsey cattle, Shorthorn cattle, Hereford cattle and Holstein-Friesian cattle. The Guernesys were not a uniformly high class lot and sold at rather low averages. The real enthusiasm was in the sales of the Shorthorns under the auspices of the Northwest Shorthorn association, of the Herefords under the direction of the American Hereford Cattle Breeders' association and the joint sale of Holsteins handled by George Gue.



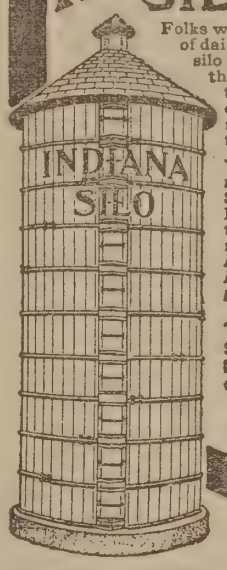
In the three sales mentioned above the practice of former years was continued and higher averages were realized as compared with former years. The Herefords were for most part bulls for the range trade with some offerings quite low in flesh. The average of 46 head was $363 as compared with $318 last year. The top price was paid for a 2-year-old bull offered by Henry Thiessen. Another 2-year-old consigned by the University of Idaho sold at $750. Eight heifers were sold and met with brisk demand. Chandler sold a yearling at $500 and Theissen a yearling at $435.

The Shorthorn sale was remarkable for the high average of $433 on an offering of approximately 70 head, few of which were in at all high flesh. Another interesting and significant feature was the large number of bidders and the wide territory represented by them. One bid might be from Oregon and in rapid succession bids would come from California, Idaho or Montana and Washington. The roan heifer sold by Frank Brown to W. J. Townley at $1320 was one of the most noteworthy events of the sale.

The Holstein men sold considerably over a hundred head at a splendid average, but the sensation in this camp and one of the notable events of the week was the sale of the bull to Von Herberg of Seattle at $21,500.

So firm is the faith of the men behind the Portland show in its great field of usefulness and its permanency that they have already launched a campaign for $100,000 to build a splendid amphitheater for adequately and handsomely housing it.

The two shows mentional did a notable work for the live stock industry of the west and have a wondrous work yet to do. May they live long and prosper exceedingly.



Time to think about a silo!

A lot of men will decide to order silos this month. They see how the high cost of hay and feed *puts a crimp* in their bank account.

Look around—talk with neighbors who have an

INDIANA SILO

Folks with a good herd of dairy cows and a silo are *living easy* this winter, and there's *no drudgery* connected with their feeding.

Hogan Scores

More About Records at Pullman

By JAMES DRYDEN

During the poultry conferences of Farmers' week at the O. A. C. considerable interest was manifested in the Hogan scores at the Pullman laying contest. There is great interest in the question of how to select the layers. Some people have a notion that the poultryman, if he knows his business, must be able to select the good layer by an easier method than the trapnest. I am glad to see this interest. The poultry keepers are at last beginning to realize that there are differences in hens; that there are hens making a profit and other hens in the same flock and of the same breed that are not making a profit. The final result of all this discussion will pretty surebly be in a few years better layers and a larger and more profitable poultry industry.

A close watch is being kept on the Pullman contest, and it will be a disappointment if it should demonstrate that the Hogan system is not reliable. We are all looking for an easy way of selecting the layers. The results of the contest for the first month and a half do not seem to be favorable to the system. In most all the laying contests the pens that win or finish near the top, are among those that are near the top at the beginning of the contest. This accords with the demonstrated law that the early laying pullet is the best layer. From the report for November it is shown that among the 20 pens that were scored by Hogan to lay the most through the year, there are only two of them that appear in the list of the 20 pens that made the best records for the first month and a half. It is very certain from this that the 20 best at the end of the year will not be in the positions given by Hogan. The present indications are that the majority of the 20 best will not be among Hogan's best. But we will wait and see.

Petaluma Hens

Produce Eggs Valued at $4,000,000

By JAMES DRYDEN

The eggs produced in the Petaluma, Cal., district and shipped to market or hatched by the hatcheries amount to 15 to 16 million dozen a year, worth probably $4,000,000.

The poultry lectures and consultations at Farmers' week, Oregon Agricultural college, were well attended and a very strong interest was manifested in all the program. In addition to the talks made by members of the staff of the poultry department a number of highly valuable talks were made by practical and successful poultrymen. H. A. George of Petaluma, Cal., attended and discussed Petaluma methods in three lectures. His exposition of Petaluma methods was, I believe, the best that has ever been given, at any rate to my knowledge. C. M. Wilcox, Salem; W. M. Wire, Newberg, and W. H. Hart of Beaverton, gave practical talks as successful poultrymen.

Why Petalum Is Poultry Center.

Mr. George gave five reasons for the great growth of the industry there.

First, and probably foremost, a favorable climate. The average temperature is neither very high nor very low. In summer it ranges about 70 to 80 degrees and rarely over 90. The winter temperature ranges about 50 and 60, though occasionally there is a slight frost. There is a moderate rainfall and plenty of sunshine. The mildness of the climate makes the housing cost low. The colony houses that are characteristic of that country cost to build about $7.50 per hundren hens.

Second, feed at reasonable prices is possible on account of the great quantities that are handled. One dealer had done a business last year of $1,600,000 in feed, and his commission for handling it was only 3 per cent.

Third, cheap transportation for feed and supplies as well as for eggs on account of both rail and water transportation encouraged the industry.

Fourth, soil conditions are good.

Fifth, the credit given by local dealers is an important factor, a big help to the poultryman. The credit on the books of the merchants of Petaluma has amounted at times to $1,500,000. This has enabled many poultrymen to lay in supplies of feed in quantity and at a time when feed is cheap.

PROFIT IN TURKEYS

Runs His Fowl on Irrigated Farm.

A good record for turkeys was made by George C. Coe of Stanfield, Ore., this year. From 119 birds he cleared $260 over the cost of feed and keep and has about 25 birds left for the late market. This income was made despite the fact Mr. Coe lost a large number of young turkeys in the late spring last year. He runs his fowl on his irrigated farm here.

Public Markets

Will Be Tried Out at Schools

(Continued from page three.)

be doubtful of the wisdom of the city putting a larger sum into a central public market."

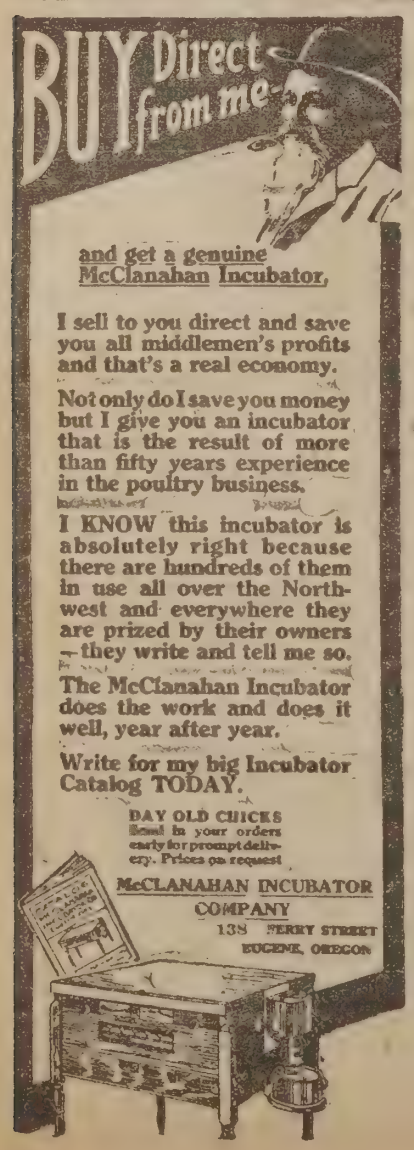
The chief merit of the plan lies in the elimination of overhead expense. In making the markets free Spokane is profiting from the mistake made in New York and other cities of charging such high rentals that the farmers were driven away.

Baltimore Free Markets.

President Marcus M. Marks of the borough of Manhattan, New York, discusses this feature of the marketing problem with great clearness and insight. He points out that in Baltimore, where free markets are a great success, there are over 5000 stalls in open public markets. In the city of New York, which, on the basis of population, should have 10 times as many, there are not one-tenth. Therefore, Baltimore has 100 times the facilities of New York in proportion to its size.

"My recent experience in connection with open public markets," says President Marks, "causes me to feel very keenly on this subject. Our citizens' committee of the borough of Manhattan aided me to select spaces which had never brought any revenue to the city, and which through use as open markets brought great advantage at the rate of $1.50 per square foot (at which rate $3750 a year would be the rent of 25x100 feet) has caused the markets to languish. Two-thirds of the tenants moved out when they saw they could not afford the rent and the others were bound to add to the selling price of their goods in order to protect themselves.

In New York City.



"The fact that as many as 100,000 people patronized the open markets in the borough of Manhattan in a single day two years ago proves that the demand exists and that there are many people who are willing to forego high-priced service in order to cut down the cost of their living. The city owes opportunity to these people. Those who desire comforts and services will patronize the stores."

In one important respect open markets in Spokane would have a better prospect of succeeding than open markets in New York. It is estimated by authorities that less than 5 per cent of the farm products consumed in New York are grown within hauling distance of the public markets. In Spokane there is sufficient land under tillage within easy hauling distance to more than supply in season the population's every need.

Believing that readers of the Farmer in all parts of the Pacific northwest will be keenly interested in the Spokane experiment, we shall keep a close watch on it and report progress from time to time.

Madison County Poultry Show.

The Madison County Poultry and Pet Stock association announces its second annual show at Rexburg, Idaho, January 18, 19, 20, 1917. At the initial show in 1916, 300 birds were shown and $150 in merchandise premiums was paid. This year more birds will be entered, ribbons and merchandise premiums will be given and cash prizes ranging from 50 cents to $5 will be awarded in all standard varieties. C. G. Wherry of Payette, Idaho, a licensed A. P. A. judge, will place the awards. Every bird will be scored.

Embargo Bill

Sees Two Sides to the Question

The Farmer is constantly receiving interesting expressions of personal opinions from its readers which it is glad to pass on to others.

To the Editor of the Farmer: There has been a good deal said about the pending embargo bill. It strikes me it is like most questions—there are two sides to it. In the first place, most of the products are out of the farmers hands and in the hands of the speculator, consequently it would not hurt the farmer to any great extent. Second, if a farmer who is holding for higher prices than have been offered still has his product on hand, he is very likely to be in circumstances such that a slump would not cause him to go hungry. Why not work in cooperation with our city brothers? We do not want them all to go to the farm; we need their product as well as they need ours. The slogan during the campaign just ended was "America first." Then if there is a surplus let the warring nations have it. If their food supply was uncertain in Europe, probably they would quit fighting long enough to raise something to eat. Why not have a general discussion of the question through the columns of the Farmer and see what the rank and file think of the proposed bill.

It is taken for granted that the editor is not desirous of molding opinion, but wishes to bring out the facts of the case.

Live and let live.

ED VANCE.

Twin Falls, Idaho.

The Motor Car

On the Farm

Government Road Building.

The federal aid soon to be given to road building throughout the United States is of more significance than it might at first appear to be. Under the special law authorizing it, there will be expended by the national government some $85,000,000 on roads throughout the states. This is to be expended only when the states receiving it provide an equal amount, and therefore means that sooner or later under provisions of the law there will be expended the sum of $170,000,000 for the betterment of roads.

An Auto Per Mile.

There are 2,500,000 miles of roads in the United States and there is an average of one auto per mile, or 2,500,000 autoes in the United States. It has been estimated by one of the leading manufacturers that the average value of automobiles in the United States is $1000, which, if true, would make the value of all of them $2,500,000,000. This may be high, but at even half of $1000 per car the total value would be $1,250,000,000, which in itself is quite a sackful of money.

Motor Vehicles in Oregon.

A statement prepared by Ben W. Olcott, secretary of state of Oregon, of the different transactions in the automobile department for the year 1916 shows the amounts and the various sources from which the receipts are obtained.

Total receipts are shown to be $146,232, derived from 46,006 different transactions, segregated as follows:

Thirty-three thousand nine hundred seventeen automobile registrations, $10,104; 4019 chauffeur licenses, $7342; $10,104; 4019 chauffeur licenses, 07342; 278 dealers' licenses, $2780; 389 duplicate motor vehicle plates, $389; 95 duplicate motorcycle plates, $95; two duplicate dealers' plates, $2; 61 duplicate chauffeur badges, $61; 252 additional dealers' plates, $630; 3625 transfers of motor vehicles and motorcycles, $3625.

The average fee received by the automobile department for all transactions is $3.17, while the average fee received for the registration of automobiles is $3.57. Inasmuch as registration fees for automobiles range from $3 for cars below 26 horsepower to $10 for cars above 40 horsepower, the fact that the average fee is but $3.57 shows to what extent the smaller cars predominate.

Elect Officers

Graham Heads Okanogan Pomona

At the recent meeting of the Okanogan County Pomona grange at Malott the following officers were elected:

Master, F. C. Graham, Independent Grange; overseer, Mrs. J. L. Freeman, Aeneas Lake; lecturer, Arthur Wells, Cloverleaf; secretary, J. L. Freeman, Aeneas Lake; treasurer, W. T. Beals, Cloverleaf; steward, Ben Garigen, Happy Hill; assistant steward, Mr. Willetts, Horse Spring Coulee; chaplain, Mrs. Jennie Wells,- Cloverleaf; gatekeeper, U. F. Fries, North Star; Ceres, Mrs. W. C. Ostenberg, Independent; Flora, Mrs. George Rudolph, Cherokee; Pomona, Mrs. U. E. Fries, North Star; lady assistant steward, Mrs. Ambrose Murray, Independent.

The matter of the new farm loan act recently passed by our national congress was thoroughly discussed and all information possible secured on that subject, and there is no doubt that quite a number of farmers of this section of the country will avail themselves of the new law to secure money at a cheaper rate than now prevailing to use for developing purposes.

GRAYFISH PALATABLE

Campaign to Convince Public.

The State University of Washington and the U. S. bureau of fisheries have united in a campaign to convince the public of the palatability of the grayfish, heretofore known and despised as the dogfish. Miss Mary Rausch of the home economics department of the university will devise a number of dishes in which grayfish is dominant. The government has satisfied itself of the desirability of the flesh of the grayfish, its abundance and cheapness, its canning qualities and its capacity to aid in reducing the cost of living.

Tokio's Population.

Tokio has 2,244,706 inhabitants.

Make Your Dairy Pay

EVEN though you have no more than three cows, there are many good reasons why you should have a **Lily** or **Primrose cream separator.** It is the only way to get all the cream. It gives you warm, wholesome skimmed milk to feed. It saves a lot of tiresome work. When you get your **Lily** or **Primrose** separator busy, you will wish you had done it when you first got your cows.

Lily and **Primrose** separators skim down to the last drop of cream in each gallon of milk. You can't beat them for close skimming. They turn easily. The bearings oil themselves as you run the machine. They don't get out of adjustment—that is important. By turning a screw on the outside of the separator once in six months or so, you keep the bowl at the correct height, and this is positively the only adjustment necessary.

Next time you go to town, drop in and see the obliging dealer who handles **Lily** or **Primrose** cream separators. In the meantime, drop us a line, and we will send you some interesting reading matter about separators.

White House Picketed

Suffrage Workers Flaunt Banners

So-called "sentinels" representing the Congressional Union for Woman Suffrage are picketing the White House, the home of President Wilson, in order to compel him to recognize them and the suffragist movement they represent. Twelve women walk back and forth before the White House so the president cannot leave or enter without seeing them and the banners they carry setting forth their "votes for women" demands. They declare they are going to keep up the picketing until March 4, the date upon which President Wilson will be inaugurated for his second term.

One cold, windy day last week, President Wilson expressed his sympathy for the shivering women by sending them an invitation to come into the White House and warm themselves, but his invitation was refused.

Harry Thaw Again.

Officers arrested Harry Thaw last week in Philadelphia on a warrant charging him with kidnapping a boy. This is the first time he has been arrested since his liberation from the insane asylum a year ago, after a fight covering years. He had been found guilty of murdering Stanford White, an artist. When arrested last week, Thaw was in a critical condition owing to his having tried to commit suicide by cutting hs throat and wrists.

Peace Gains No Ground.

President Wilson appears not yet convinced that all efforts to bring about peace in Europe will fail, notwithstanding the reply of England and her allies to the president's note of last month. While the reply expresses commendation of the motives that lie back of the president's attempt to restore peace, the allies declare that they cannot consider peace at this time. The terms which they state are: (1) The restoration of all land taken by Germany and her allies, (2) full reparation for losses incurred and (3) guarantee against future war in Europe. It is the consensus of opinion in Washington, D. C., that peace is still far off, but many express the belief that the door is open for continued conservative negotiations on the part of the United States that may ultimately bring the warring nations into agreement.

Germany has expressed strong resentment against the allies for their vigorous refusal to enter into peace negotiations, and Kaiser William has announced that the war will be prosecuted by his armies to the end. This attitude, together with the tone of the allies' reply to the German peace offer, indicate that the feeling between the warring factions is even more bitter and deadly than it has been during the past, and that something near complete exhaustion of one side or the other will be necessary before terms of peace can be agreed upon.

Buffalo Bill Dead.

William F. Cody, famous as Buffalo Bill, the scout, hunter, Indian fighter and wild west show man, died last week in Denver, Colo.

Insures Employes.

The Union Pacific Railroad company has just closed a contract with one of the large insurance companies whereby 40,000 of the railroad's employes are insured for a total of $30,000,000. The insurance is made at the company's expense, and provides for insurance of not to exceed $2500 on each employe who has been with the company one year or more. The insurance averages $750 per employe.

Mail by Aeroplane.

The experiment of carrying mail by airship is soon to be tried out by the postal authorities if present plans materialize. The trial route will be from San Francisco to Sacramento, Cal.

China Wants Peace.

The government of China has sent a note to President Wilson supporting his movement toward establishing peace in Europe. The Chinese note says that that government is suffering probably more from the war than any other neutral nation because it is in a period of reconstruction such as demands the assistance of the other nations of the world. This assistance is largely denied by the exigencies of the war.

Continue Peace Leak Probe.

Congress purposes to continue the investigation of the alleged "leak" of information concerning President Wilson's peace note of a few weeks ago before the note was delivered to the European countries. Thomas W. Lawson, financier, who was alleged to have profited by stock transactions on Wall Street as a result of the supposed leak, refused to testify before the committee of congress making the investigation, and that body has begun the necessary steps to enable it to compel him and other witnesses that will be summoned to tell fully what they know. It has been charged that some one who knew of the coming of the note "tipped off" Wall Street to its coming, thus enabling unscrupulous stock transactions to the immense profit of some traders and loss to others.

Wages Have Increased.

A recently made survey covering a large portion of the United States indicates that there is a general increase of wages to laboring men. Clothing factories, harvester machinery factories and mills in Chicago are shown to have increased wages recently from 10 per cent up. Similar increases have been made by manufacturers in Michigan and other middle western states. Railroad companies in some instances, the large corporations such as the steel corporation and many smaller concerns have voluntarily raised the pay of their lower paid employes. In practically all cases it is reorted that the increases are due to an attempt on the part of the corporations to help their employes meet the increased high cost of living demands.

Legislature Faces Task

Educational Problems Promise Trouble

Shall the tax levy for higher education (the university, the state college and the normal schools) be increased? If so, how much?

This is but one of the big educational questions confronting the Washington state legislature, and a bill has already been introduced by Representative Zednick of Seattle, providing for an increase from 1.05 mills to 1.9 mills. The former rate, which is the present levy, raises a little more than $1,000,000 annually for the institutions named. The latter levy would increase this approximately $900,000.

The Educational Survey.

The bill increasing the levy is one of 10 bills introduced by Representative Zednick with a view to putting into effect the recommendations made by the special commission which a year ago made a survey of the educational system of the state with the view to eliminating certain duplication of courses offered by the University of Washington and the state college, and also of reducing the cost of the entire higher educational system. The consideration of the bills in the legislature is reported to be taking much the form of a contest between friends of the university and college, who fear encroachments the one upon the other.

Define Courses Offered.

One of the 10 bills specifies exactly what courses shall be taught at the college and what at the university, it being contended by the friends of the college that if it is passed it will destroy much of the efficiency of the college at Pullman. Friends of the university, who are taking part in the consideration, claim that the college was intended originally to be a college of agriculture and applied science and not a college combining these functions with liberal arts education.

Those who oppose the changes are doing so on the ground that, while the college at Pullman does make and should continue to make agriculture and practical science its principal courses, they can not be given properly without the broader development of the more liberal arts subjects, such as languages, pure sciences and philosophies. They also declare that in the past these latter lines have been developed in Pullman in strict accordance with law based on the federal act creating the state college.

"Bone Dry" Measure.

With Mrs. Ina Willams of North Yakima, the only woman in the legislature, chairman of the public morals committee of the house of representatives, that committee is already wrestling with the proposed "bone dry" bill, which was introduced by Representative Halsey of Asotin county. While the legislature shows signs of favoring the passage of the bill, there is a strong sentiment in favor of passing it with a referendum clause attached by which it would not become effective until the people of the state had voted upon it at the next general election, which would be in 1918. It is argued that the people voted the present prohibition bill onto the statute books, and that it should not be changed without a vote of the people. Others are anxious to rush the measure through now, and since Governor Lister recommended its passage, it is believed that he would sign it and let it become a law immediately if it is passed.

Highway Questions.

The legislature is practically agreed to establish no new state highways until the present system is completed. This means that the state appropriations will be spent on only such trunk highways as the Pacific highway from the Canadian line to Vancouver, Wash., on the west side, the Sunset highway from Seattle across the state to Spokane; the Inland Empire highway from Spokane to North Yakima by way of Walla Walla, and other established routes of lesser extent. It is believed that the tax levy for good roads will remain the same as they are at present, 1 mill for the public highway fund and 1 1-2 mills for the permanent highway fund. The so-called public highway fund is the one which is expended in the building and maintenance of the main trunk highways by the state highway department. The permanent highway fund is the one expended by the county authorities, with the advice and approval of the state highway department, within the counties in which the money is raised.

Farmers' Union Elects.

At a meeting of the Colfax local of the Farmers' union the following officers were elected: President, F. B. Rogers; secretary, G. W. Perrine; vice president, S. W. Crumbaker. Discussion was had regarding the sack and twine question and the following committees were appointed: Twine committee—S. S. W. Crambaker, F. B. Rogers, B. F. Sherfey; sack committee—Edward Krueger, T. A. Sanders, John Bloom; auditing committee—Edward Krueger, F. B. Rogers, R. A. Hensle. The question of bulk grain handling was considered and the following committee was chosen to attend the county convention at Garfield, at which time the question of the future handling of grain will be disposed of: R. A. Hensle, B. T. Manchester, S. W. Crumbaker, and G. W. Perrine. The date of the next meeting of the Colfax local was fixed at January 14, at which time the newly elected officials will be installed.

Floating Bridges.

Two bridges in a city in India are supported on large metal tanks, which float on the water and accommodate themselves to its rise and fall.

Oh, Gawd, I love you so!
—Kipling.

My Dear Contest Editor: I have been keeping steady company with a young man for several months. He has seemed to think well of me and has always led me to believe him serious.

Recently he brought a copy of the Farmer to my home and called my attention to your Figure problem. Without asking me if I would marry him, he laid your advertisement in my lap and said he would marry me if I would solve your problem and win the first prize of $200. He said this would furnish our home and that the $75 additional that I could win by paying $1.50 for three years' subscription to the Farmer he would let me have for an engagement ring.

Just at that time I did not feel flattered and maybe I resented it too much. Losing control of my emotions, I sobbed out loud, "Henry I could hate you!" Was I hasty and do you think I am too sensible? What I really wish to know is, do you think he loves me, and would you advise me to apologize for not treating his proposition more kindly? He has big, blue eyes and beautiful hair—if anything, too much—and since he has been showing some indifference, I sometimes feel that I love him.

Do you think I should try to make myself worthy of him by solving your figure problem? Is that too much to pay for a husband, and will $200 furnish a house lovely, and is $75 enough for an engagement ring?

ESTELLE.

Estelle, my figure problem is easier than your questions. For me, anyway. I do not pretend to qualify as an expert on matrimony, and were it not that you mix my contest up with your love affairs your letter would promptly be referred to Laura Jean Libby or Beatrice Fairfax. The Contest Editor is a passe sort of philosopher who long since forgot all he knew about the psychology of love and the delicately shaded twitchings of the girlish heart.

The anguish of being dragged into moving pictures when he preferred the open air, and into tea shops where they serve birdseed and call it a square meal, all this, and much more, my dear little girl, has staunched youth's gushing flow d'amour until now he thinks of his own heart's pulsations in the cold, mechanical terms of "vibrations" rather than "throbs."

Unfortunately or otherwise, as the case may be, the Contest Editor finds his appetite dulled to those animated bon bons that come in Georgette crepe, wistaria and indestructible chiffon, or to those equally entrancing triumphs of nature done up in just plain calico prints and ruffled something—gingham, I think my mother used to call it.

Your letter, Estelle, pitches the Contest Editor headlong into reverie, and almost awakens within him the last lurking spark of those romantic grammar school days when he could gaze into the faces of his fair co-eds and throw all the feeling of a Romeo into the simple conjugation of the verb "love."

Your queries have fallen on an anemic soul sagged and satiated with the sin of loving too much, which, jostled and jilted, is plagued, purged and petrified. Those sentimental quakings which once generated the spirit that inspires the lovesick swain I fear have gone from me, Estelle, gone forever.

But now for the contest. Little girl, you are as welcome as the angels to enter this contest, but no cognizance can be taken of any motive which involves the purchase of a husband. That would be a lottery, and one of the conditions by which Uncle Sam lets this contest get by in his mails is that it shall be free of any taint of the element of chance.

Two hundred dollars would furnish a home more than good enough for any young man who demands that you work to win him, and as to the price of the engagement ring, I decline to commit myself. As a matter of personal policy, and just offhand, as a bachelor, I would say it's too much. Blue eyes are not an insurmountable objection. Too much hair is better than not enough.

Estelle, you are honest. You are human. I like you.

There are all kinds of questions coming in every day from persons who consider entering the figure contest. The Contest Editor is always glad to answer. Here are some of them:

E. S.—I am working on your figure problem, but am in doubt as to whether the sloping side of the figure "4" with the lower cross line forms a figure "7." Will you tell me the truth?

There are no trick figures and no catch characters of any kind in the design of the chart. Each figure should be added for its exact face value and be counted independently of every other figure.

J. W. S.—Would like to ask: Are there any double figures? That is, for example, would a 3 and a 9 together at any particular place in the chart be counted as "thirty-nine?"

No, there are no double figures.

This Is How to Do It

Simply add up the figures in the puzzle chart as if they were in one long column. Your success depends on the accuracy of your total thus obtained.

Figures run from two to nine, and there are no double figures or characters which are not figures. The tail of the "6" has a decided curve, while the tail of the "9" is straight. All other figures have the usual characteristics, allowing no question as to the identity of any figure.

In event that no one submits the correct total, prizes will be awarded for the next nearest solutions.

This contest is restricted to persons residing in Washington, Idaho, Oregon and Montana.

A payment of $1 to $1.50 on subscription to the Farmer entitles the subscriber to enter the contest.

The money paid will be credited on subscription to the Farmer. The advantage of paying $2.50 instead of $1 is that the winner of any of the first four prizes receives additional prize dividends apportioned on the amount paid in on subscription, besides the fact that $1.50 during this contest pays for a three-year subscription to the paper, while $1 pays for only one year.

More than one solution may be submitted by any contestant, by an additional subscription payment of not less than $1 nor more than $1.50. It is not necessary to pay the same amount with each solution if more than one is submitted.

As many prizes will be reserved as there are people tied before any prizes are awarded to those sending in less correct solutions.

You can send in a subscription for some one other than yourself and have the solution registered in your own name. Remember that by paying $1.50 instead of $1 on subscription, the larger will be your dividends if you win one of the four leading prizes; but not more than $1.50 will be received with one solution.

$750 = Prizes = $750

FIRST PRIZE, $200,
to which will be added 50 times the amount paid by the subscriber with the winning solution. For example, if you pay $1.50 on subscription, this prize will be worth $275.

SECOND PRIZE, $100,
to which will be added 30 times the amount paid by the subscriber with the winning solution. This prize may be worth $145.

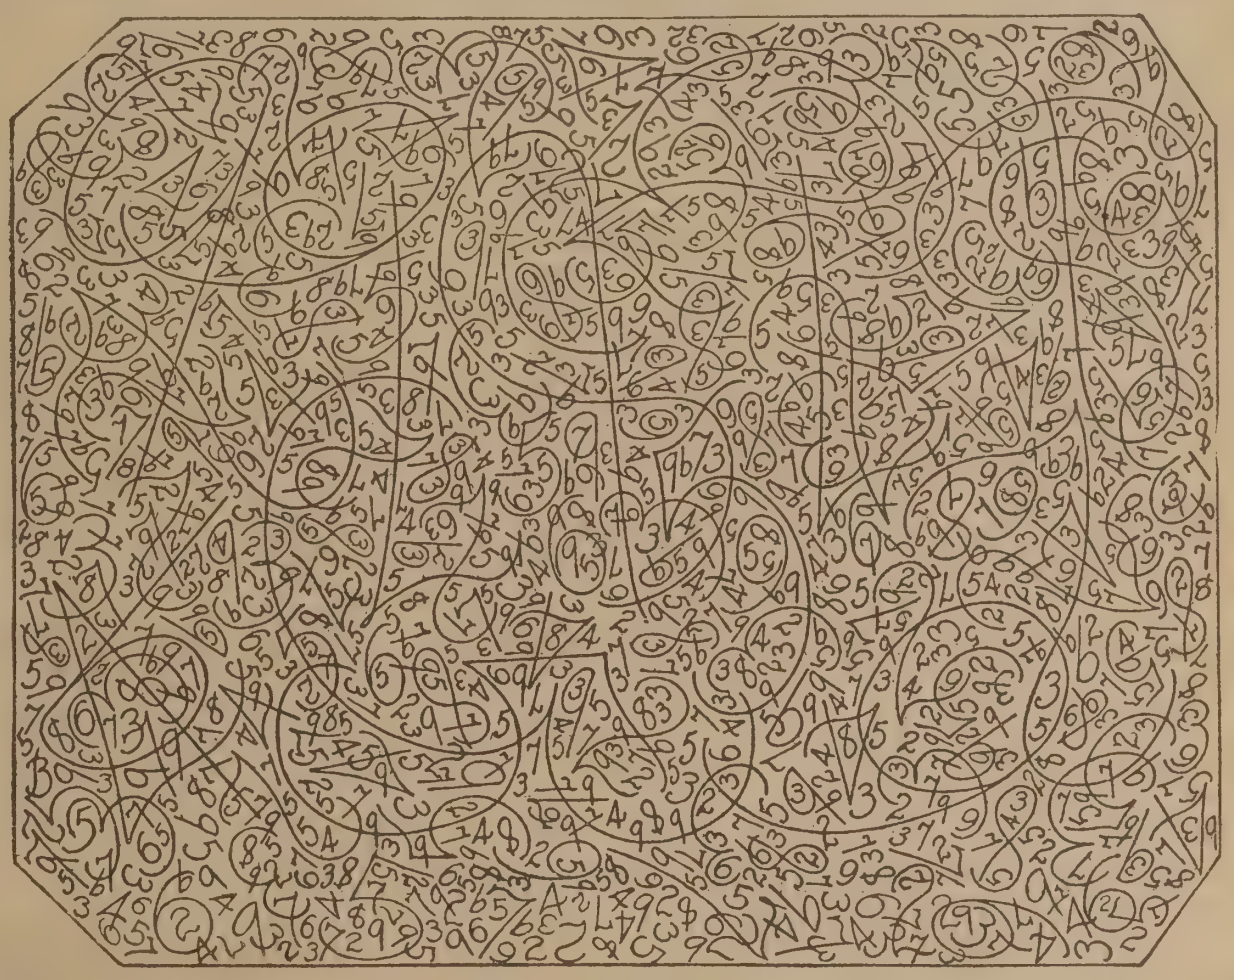
THIRD PRIZE, $60,
to which will be added 20 times the amount paid by the subscriber with the winning solution. This prize may be worth $90.

FOURTH PRIZE, $50,
to which will be added 10 times the amount paid by the subscriber with the winning solution. This prize may be worth $65.

FIFTH PRIZE, $40.

SIXTH AND SEVENTH PRIZES, Each $20.

EIGHTH TO SIXTEENTH PRIZES, Each $7.



SEVENTEENTH TO THIRTY-SECOND PRIZES, Each $2.

CASH MUST ACCOMPANY.

Solutions unaccompanied by cash payment on subscription will not be registered. Use registration blank on this page. Employes of this paper or members of their families are not eligible to enter this contest.

Don't send in your charts and working papers unless called for by the Contest Editor. Simply write your solution in blank space provided in "Registration Blank."

Remember, the contest closes March 17, 1917.

Apples

When They Are in Best Flavor

To the Editor of The Farmer: Will you please republish that list showing when the different varieties of apples are best for use during the winter; that is, when they are ripe, and when they begin to decline in favor. J. R.

Chesaw, Wash.

The Answer.

October and November—Jonathan; brilliant red; a splendid family sort, juicy, rich and vinous.

October, November and December—Banana; clear, pale yellow with pinkish red blush; very tender, with faint aroma of banana. Grimes; golden yellow; an old-time favorite; tender and spicy with delightful aroma.

November, December and January—Spitzenburg; bright red; the aristocrat of apples; crisp, juicy, deliciously rich and fragant. Ortley; light, waxy yellow, fine grained and juicy; ideal for dessert. Delicious; dark red; the latest favorite; sweet, mildly touched with acid; fine and melting.

December, January and February—Stayman; rich red; an improved Winesap; very tender, with rich subacid.

January, February and March—Rome Beauty; red striped; the champion baker; sprightly and pleasant.

February, March and April—White Winter Pearmain; pale, favorite dessert apple. Yellow Newtown; greenish yellow; fine flesh, with refreshing high flavor; "The autocrat of the breakfast table."

March, April and May—Winesap; intensely rich red; subacid; very inviting.

April, May and June—Arkansas Black; mahogany red, nearly black, firm, fine grained, crisp and juicy, good keeper.

Too Much Farm Specialization

Fruit growing is only one part of farming, and except in rare instances should not be relied upon to produce all the necessities to support and maintain the home on the farm.

This is the sixth of a series of articles summarizing the addresses and the discussions of orchard problems at the apple conference held in connection with the ninth annual apple show at Spokane.

The tendency today is to get away from the extreme specialization in fruit that has marked the last few years, according to Professor O. M. Morris of the state college at Pullman, in an address delivered before the apple conference. Fruit growing is only one part of farming, he said., "If the farm ultimately reaches what it should, its own organization and character must be of the type to produce the necessities to support and maintain itself."

Professor Morris said that by correct farming a man could make a good, comfortable living, but that such a farmer seldom gets rich. The farmer who gets rich is one of two classes, what he called the speculator and the "miner." By the former he meant men with side lines or special lines, who used the farm only as a basis for their operation. By the latter he meant the man who has robbed the soil of his farm by taking out year after year its fertility by excessive cropping and inadequate building up of the soil through fertilization processes.

Soil Must Be Conserved.

"In a new country the soil and its fertility is looked upon as a thing found, costing very little and can consequently be dispensed with with equal freedom and it is not handled in the same conservative way that it is in the older sections of the world," said the speaker. "The crops that we are growing here in the northwest are plants that through time immemorial have developed on soil that had a reasonable proportion of decaying vegetation in it, yet we are trying to grow apples on soil almost devoid of humus. It is the same as it is with the live stock man. A good live stock man seldom calls in a veterinarian, but the man who does not take good care of his stock is always consulting one. It is good care that we need to give the soil. In that sense I want simply to impress this thought that there is no possibility of making our orchards in the northwest the best that it is possible for us to make them without a system of diversified farming whereby a continuous supply of decaying vegetation can be used to put back into that land. Nitrogen is a good thing to give your land a boost, but you must not overdo it."

Cost of Production.

"I have been interested in some charts published in Des Moines, Iowa, showing the relative profit and loss in certain farm products, during the last 12 years. During over half of that time hogs have sold below the cost of production—that is producing pork by the use of corn. There are men in Iowa who have been making money on hogs, but those men have been feeding something cheapter than corn. Another chart covering the last 140 months shows that fat steers during 70 of those months have sold below the cost of production. Things have not been all glorious for the special live stock man. Every special line has got into this kind of trouble. Take butter during the last 140 months. During only 49 of those months has it sold above the cost of production in the state of Iowa. Of all our crops here in the northwest I believe there is only one general crop that has sold above the cost of production for the last five years, and that is wheat, and I don't believe that has been if you will take into consideration the depletion of the land that has taken place. So long as we grow only one crop and that not nearly so cheap as they can produce apples in the state of New York, we can not hope to make a profit. The reason they can grow apples cheapter than we is that the orchard is simply a part of the farm development.

Year-Round Labor.

"Another thing in this northwest is the labor on the farm. We must recognize that so long as we have a specialized industry that has only one crop and that expects to import its labor for the season we are going to face just such conditions as the northwest has been facing the last summer. You can't get satisfactory help to work at one kind of a job for three months, and another kind for three months and still another kind for three months. We must have a system of farming that will occupy the labor of a district throughout the greater part of the year. It has been found that there is a very close relation between the quality of the labor and the continuity of the labor throughout the year."

Apples in Cold Storage.

Reports from 450 storages show their rooms contain 2,603,584 barrels and 3,913,290 boxes of apples. Holdings reported from 367 storages showed 2,421,954 barrels and 3,744,162 boxes on December 1 as compared with 4,213,203 barrels and 3,684,557 boxes on the same date a year ago, a difference of 32.6 per cent. The barreled apple holdings show a decrease of 42.5 per cent and the boxed apples an increase of 1.6 per cent as compared with those of last year. The holdings have increased 9.0 per cent since November 15 as compared with an increase of 9.0 per cent during the same period last year.

Her Suggestion.

She—Come to me in a month from now and I'll give you my answer.

He—But how can I stay away from you for a whole month?

She—Go and ask papa now and it will be a month before you will be able to get around.—Boston Transcript.

We Can Not Cheat Nature

Who Succeeds in Orcharding Must Study Nature

By GRANVILLE LOWTHER

Scientific orcharding is orcharding according to the laws that environ us, according to the nature of things. For instance, the man who is scientific, either in education or thought, would not try to grow oranges in Canada or apples in Florida. The conditions of climate in Florida are not adapted to apples, nor are the conditions in the north adapted to the growing of tropical fruits. To be scientific is to conform to the laws under which we are placed.

Ecology is that science which treats of the adaptation of plants to their environment. The fact that the Yellow Belle Flower is the best apple for California is no argument that it is the best for the Pacific northwest. The fact that the Baldwin is the best for New York is no reason why we should plant it in the state of Washington. The fact that the McIntosh Red has been considered the best for Bitter Root, Mont., is no reason why it should be planted in the vicinity of Spokane. (The McIntosh Red, which in the past was considered well adapted to Bitter Root, is now considered to be not well adapted.) The fact that the Wagener is a good apple, one of the best at Spokane, is no argument why it should be planted at North Yakima. In the earlier days of orcharding in this country people did the best they knew, but the fruits best adapted had to be learned by experience, and the experience is not all gained and the facts are not all in.

There is a law called inertia, which implies that any body continues in a state of rest unless it is impelled by force to change its state. There is also a law of gravitation, which no one can violate without suffering the results. People observe these laws without thinking of themselves as scientific, yet whoever does so is scientific in fact, whether he knows it or not.

So with scientific orcharding. Some men have a knowledge of the workings of nature who do not regard themselves as scientific, but who observe certain results as growing out of certain causes and adjust themselves to the conditions. A man may not know the chemical qualities of certain fertilizers, such as barnyard manure, nor the constituents of the soil to which he applies these fertilizers; but if he puts the manure on the land, and if it is what the soil needs, it will improve his crops as much as if he were a soil chemist. The man who stumbles onto a gold nugget and thereby discovers a rich deposit of ore is just as much a beneficiary of nature as the man who makes a similar discovery by means of the most careful study in the light of geological science. The only trouble is that they who do the right things without knowing why they do them are just as likely to do the wrong things and thereby lose what they acquired by the same law of ignorance which led them to acquire. Islands have been discovered by accident, but that does not argue that in sailing the seas the compass and chart are of no value.

Our old orchards were planted without regard to the adaptations of varieties to soil, climate and local environments, but that is no reason why we should continue the mistake of the pioneers who were guided by experiences acquired under different conditions.

To sum it all up, we can not cheat nature. Whoever would succeed must study nature's laws and keep them. The pathway of life is strewn with wrecks because of lack of adjustment to the forces that are in control.

Healthy Grain

Seeds grow faster and mature into good healthy grain when first freed from smuts by using

FORMALDEHYDE
The Farmer's Friend

This powerful disinfectant destroys grain smuts and fungus growth. Every up-to-date farmer should use Formaldehyde. It has the supreme endorsement of the U. S. Dept. of Agriculture. Our Formaldehyde in one pint bottles costs 35 cents and treats 40 bushels of grain. Big illustrated hand book sent free on request.

PERTH AMBOY CHEMICAL WORKS
100 William Street New York

White Southport Globe
The Great Commercial Onion.

Has yielded 500 bushels and more an acre; its color, shape and size give it great market value; its keeping qualities and productiveness make it very profitable. See our catalogue for full description and lowest prices. Our stock of all standard varieties of onion seed is unsurpassed as to quality and germination. We have a full line of Garden, Flower and Field seeds.

Our Seed Book is free. Write for your copy today; postal is as good as a letter.

Seed Wheat

Shortage Possible, Says Houston

Secretary Houston of the United States department of agriculture has issued a warning to the wheat growers of the United States that unless care is taken the country will find itself short of good seed grain for spring sowing. While Washington, Oregon and Idaho, the secretary says, will have seed wheat of excellent quality if our farmers do not sell short, the varieties grown here are not suited to the northern great plains states, and varieties adapted to this region can not be obtained elsewhere.

Summarized, the situation is outlined as follows by Secretary Houston:

"The wheat crop of 1916 in the spring wheat states of the upper Mississippi valley was very badly injured by rust and other diseases. Not only was the yield much reduced, but the quality of the grain was generally very poor. Much of the grain is light in weight and shrunken, and doubtless contains many diseased kernels. Such grain is not good for seed purposes. Although plants may be procured from such seed, they are not likely to be vigorous, and many of them may be diseased, and these diseases will either cause their death before maturity or be spread to other plants, or both.

"It is advisable, the secretary believes, for farmers in this region to make sure promptly of a sufficient supply of good, plump seed, of adapted varieties, which will grow when sown. If plump, healthy seed can not be obtained the seed that is available should be carefully screened and fanned to remove all those grains that are not good for sowing. In no case should the prevailing high prices tempt the farmer to part with his good seed wheat and cause him to rely upon shrunken and diseased seed for sowing. Such a course is likely, it is said, to result in disaster to next year's crop.

"In the states of Washington, Oregon and Idaho the spring wheat crop was large and the grain of excellent quality. The tempting prices for wheat should not induce the farmer to sell what should be kept for seed, it was pointed out, because no seed of varieties adapted to this section can be obtained elsewhere. The dry fall has curtailed the sowing of winter wheat and the acreage of spring wheat will be larger than usual, therefore, and the demand for seed increased accordingly."

CRANBERRY GROWERS
Putting 160 Barrels on Market.

W. E. Schimpff and C. N. Bennett of Astoria, cranberry growers, have been in Portland negotiating for the marketing of their output. They now have 100 acres of bog set to cranberries, but this season only a few acres have come into bearing. They have 160 barrels, however, which they are putting on the market.

UPPER SNAKE RIVER
Shipment of Grain by Steamer.

Steamer Spokane of the Oregon-Washington Railroad & Navigation company has resumed service between Lewiston and the upper Snake river points after having been tied up on account of ice floes. The steamer will be engaged in the movement of grain from the upper Snake river warehouses to the dock at Lewiston, where 60,000 bushels will be stored until cars are available for its movement to the markets.

On account of the great variation in local climatic conditions, moisture, soil, etc., it is up to the readers of The Washington Farmer always to remember that methods which prove successful in one locality may not work out in others. It is our aim to gather the experiences of farmers in every section of this state and pass these experiences on to our readers, that they may try out or adopt such as may be applicable to their locality and conditions.

Sugar Beets

Production of Domestic Seed

Sugar beet seed was grown commercially in this country during the past year in several state from Michigan to California. The crop of seed harvested in 1915 was so satisfactory—according to the report of the chief of the bureau of plant industry, U. S. department of agriculture—in each of the areas tested that a largely increased acreage was planted this year.

This bureau has assisted in an advisory way in growing, selecting and siloing the roots, planting them in the spring, harvesting and cleaning the seed, and, in general, endeavored to produce the largest amount of commercial seed possible at a minimum cost. Approximately 5000 acres are in beet seed in this country this year, while we require the product of at least 16,000 acres for a normal planting, not considering the natural expansion of the beet sugar industry. Each new mill will require an average of 200 acres in seed to meet its planting requirements. Seven new mills are in process of construction for this year.

In answer to a letter of inquiry from the Farmer, C. O. Townsend, pathologist in charge of sugar beet investigations of the U. S. department of agriculture, writes:

"In 1916 nearly 1000 acres of sugar beet seed was produced in Idaho; something over 2000 acres in Colorado, and a small acreage in Montana. There was also a small acreage in California and several hundred acres in Michigan. The seed in Idaho was grown for the most part in the vicinity of Idaho Falls; that of Colorado was grown in the vicinity of the sugar factories in the northeast part of the state and in the Arkansas valley; the Montana seed was grown near Billings and the Michigan seed near Blissfield."

AUTOS BLANKETED
Horses Are Left to Shiver.

An Emporia woman telephoned William Allen White the other day that she counted 12 blanketed motor cars and seven unblanketed horses in front of a church during service time the preceding Sunday morning, says the Kansas City Star. The motor cars were blanketed for the obvious reason that radiators freeze, and frozen radiators cost money. But a horse is constructed differently and consequently is not wrapped up so carefully. However, Mr. White believes a horse can do considerable shivering during church time, and he has a sneaking notion that a prayer which is started while the petitioner's horse is standing unblanketed outside may be lost in transit.

SAGER IS MASTER
Pleasant Valley Grange Elects.

At its last regular monthly meeting the Pleasant Valley grange in Multnomah county elected the following officers: G. N. Sager, master; Miss Hazel Berke, overseer; Mrs. Kate Poppleton, lecturer; Mrs. J. L. Johnson, chaplain; Mrs. Anna Lehman, secretary; Mrs. Isabel Masters, steward; Loyal Giese, assistant steward; Mrs. H. C. Restoff, treasurer; Albert Troge, gate keeper; Mrs. Effie Sager, lady assistant; Mrs. M. E. Donley, Ceres; Mrs. W. N. Moore, Pomona; Miss Edith Butler, Flora; Miss Hazel Stradley, musician; H. E. Poppleton and T. P. Campbell, trustees.

RECORD PRICES
Berry Growers Demand 4 Cents.

The best prices berry growers have ever received in Whatcom county for raspberries will be paid members of the Nooksack Valley Fruit Growers association, recently organized, in 1917. By holding out for better offers than were made them a month or two ago they have just secured 4 cents a pound, or three-fourths of a cent more than was paid them last summer for barreling stock. On this basis some of them have contracted for their next two years' crops and others for next year's only.

Attendance at Movies.

It is estimated that the daily attendance at the moving picture theaters in the United States is more than 25,000,000.

Alfalfa

Heaviest and most vigorous strains, producing 3 to 7 tons per acre—3 to 5 crops a year. Strongly recommended by all Agricultural Experiment Stations. Big money-maker. One of Wisconsin's Governors received $2500 in hay from less than 30 acres by sowing our 20th Century Brand. Salzer's Northern Grown, carefully selected strains are adapted to varied soils.

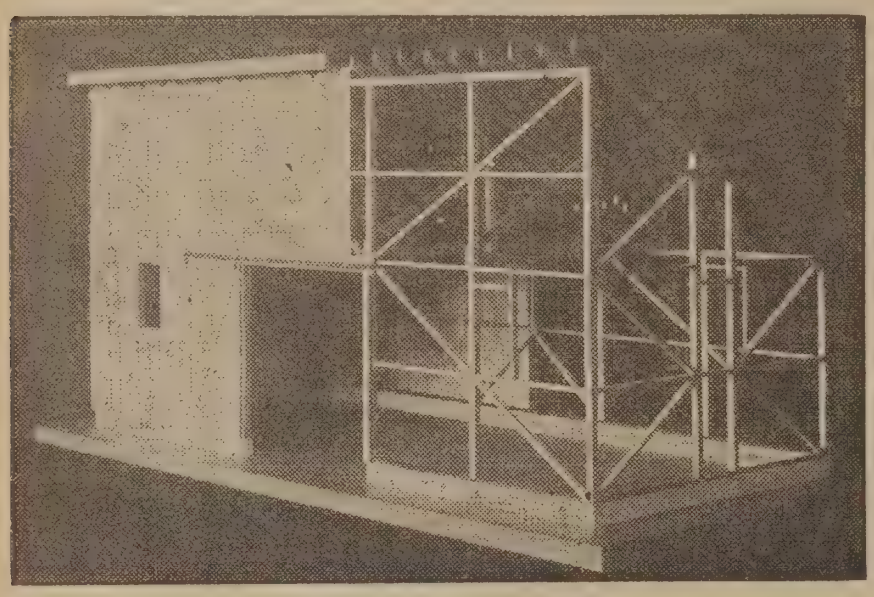
One-Story Implement Shed



Can Be Made Simple, Artistic and Utilitarian

An attractively covered and amply illustrated pamphlet on implement sheds, written by Professor K. J. T. Ekblaw of the College of Agriculture of the University of Illinois, is the first of a series of bulletins on farm buildings being prepared by construction engineers for the National Lumber Manufacturers' association, the series of nine in all on various buildings about the farm.

The publication on Implement Sheds, like the others which follow it, goes deeply into the question of how to build buildings for the farm of sufficient strength and durability to prove of efficient service can be increased to 15 years providing proper care is given, and the machinery kept in sheds of proper type. It is almost equally safe to assume that the average life of uncared-for machinery will not be much more than five years.

He in part describes the one-story shed in the accompanying illustration, as follows:

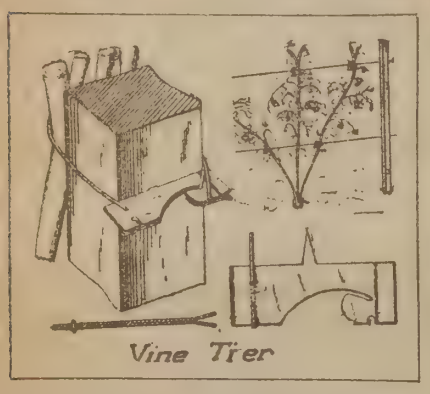
The needs of the average farm for a cheap, easily built implement shed are met by the simple shed type. The framing consists of 6x6 posts set on a light 1:2 1-2:5 mixture concrete foundation at intervals of eight feet, the plate consisting of two 2x6's. Short diagonal braces can be set in underneath between the plate and the post in order to give the plate further support. The rafters for a span of 18 feet should be at least 2x6 and better 2x8, set not less than two feet apart on centers. The wall covering may consist of vertical siding, either 10 or 12 inch boards, with the cracks covered by ogee battens. For horizontal siding studs are necessary; these should be 2x4's, placed not over 3 feet apart. Either drop siding, German or novelty siding or ordinary weather boarding may be used satisfactorily, but the latter is somewhat light for a building of this kind and would probably not be as durable as the others mentioned.

Simple shed for implements.

in the highest degree economical for the builder.

The author in addition to his technical suggestions, lays down as a general proposition the advisability of painting the farm buildings, for preservation against weather, insects, or other destructive agencies, as well as to give the farm a prosperous appearance. He says also that an implement shed can be erected in such a manner as to be simple, artistic, and utilitarian. His pamphlet gives hints for the erection of open, simple, two-story and wide enclosed types.

Professor Eckblaw says:



"To take 10 years as the average life of farm machinery is certainly to be considered conservative. It is entirely safe to assume that the average length

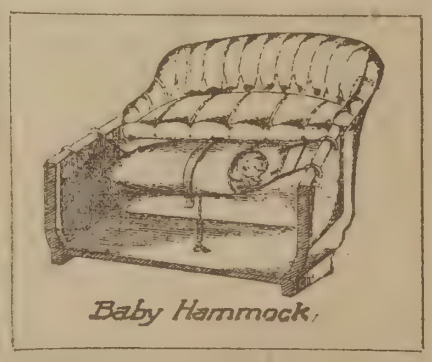
Inventions

By C. J. LYNDE, Macdonald College, Quebec.

Vine Tying Device.

The object here is to provide a simple means of tying vines to vertical posts and to horizontal wires. It is a piece of stamped metal bent on itself and flared at one end. The operator

Vine Tier



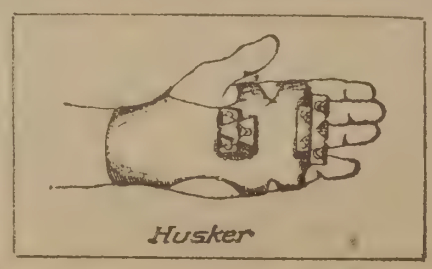
forces the spike into a post and passes the attached wire around the post and vines, or he forces the flared end over a horizontal wire and binds the vines in the same way.

The Mound Bird.

The mound bird of Australia makes a large mound sometimes 150 feet in circumference, and its eggs are deposited in it at a depth of five or six feet.

Baby Hammock.

The stretcher rod at each end of this hammock is supported by two springs

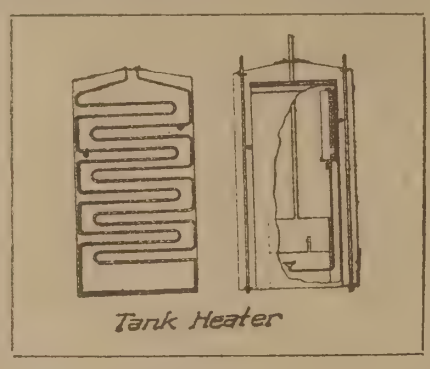


Baby Hammock

attached to spaced hooks. A fifth spring at the bottom prevents swinging and excessive motion.

Corn Husker.

The hooks of this husker are so placed, on the left hand, that they

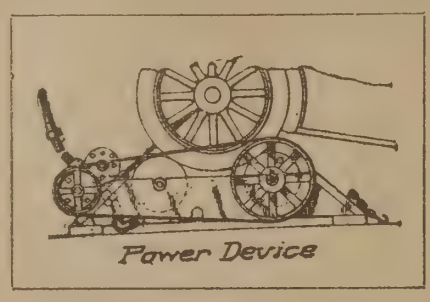


Husker

grasp the husk firmly when the hand is closed about the ear. A sharp blow by the right hand then separates the husk in one motion.

Tank Heater.

This invention is a heater which is placed inside a water tank, and which gives out enough heat to prevent the



Tank Heater

water from freezing. The hot gases from the burning oil pass over a large surface before they escape.

Power Transmitter.

Each rear wheel of the automobile here rests on two broad-rimmed wheels and the power is taken from the axle

Power Device

of one pair by means of a pulley and belt. We show the device driving a rotary pump, but it can, it is claimed, drive many other machines.

Complete State Road Survey.

The county engineer has completed the survey and cross-section work on the proposed state road north from Sprague to Harrington. Over a part of the distance two routes have been surveyed and the definite route of the road will be established after the county engineer has gone over the estimates for the different surveys. The county commissioners have set aside $38,000 for construction work on this road for the coming year, which amount will be sufficient to surface, grade and gravel more than one-half of the distance between Sprague and Harrington. The new road will shorten the distance between the two towns about one and one-half miles and the maximum grade is not to exceed 5 per cent. The contract for construction work will probably be let early in March.

BUYS CLOUSE FARM

Barkhuff Pays $90 Per Acre.

G. P. Barkhuff, a well-known young farmer of Colton in Whitman county, has bought the R. E. Clouse farm near Johnson. This is one of the best improved farms in the Palouse country and besides it has a modern nine-room house, large barn, cement floor hog and chicken house. The farm land consists of 200 acres, of which 65 acres are in crops. The entire place is fenced and is well watered. The consideration was $90 per acre. Mr. Barkhuff is a former state college student.

Germ Theory.

The germ theory dates from 1863.

When Knighthood Was in Flower

BY EDWIN CASKODEN

(Continued from page eight.)

and what his degree?" went on Mary in a bantering tone.

"He has no degree; he is a plain untitled soldier, not even a knight; that is, not an English knight. I think he has a German or Spanish order of some sort."

"Not a duke; not an earl; not even a baron or knight? Now he has become interesting."

"Yes, I suppose so; but don't bother me."

"Will he be at the dance and banquet tonight?"

"No! No! Now I must go; don't bother me, I say." And the king moved away.

That night we had a grand banquet and dance at Westminster, and the next day we all, excepting Lady Mary, went back to Greenwich by boat, paying a farthing a head for our fare. This was just after the law fixing the boat fare, and the watermen were a quarreling lot, you may be sure. One farthing from Westminster to Greenwich! Eight miles. No wonder they were angry.

The next day I went back to London on an errand, and over to Wolsey's house to borrow a book. While there Master Cavendish, Wolsey's secretary, presented me to the handsome stranger and he proved to be no other than Charles Brandon, who had fought the terrible duel down in Suffolk. I could hardly believe that so mild-mannered and boyish a person could have taken the leading part in such a tragedy. But with all his gentleness there was an underlying dash of cool daring which intimated plainly enough that he was not all mildness.

We became friends at once, drawn together by the subtle human quality which makes one nature fit into another, resulting in friendship between men, and love between men and women. We soon found that we had many tastes in common, chief among which was the strongest of all congenial bonds, the love of books. In fact we had come to know each other through our common love of reading, for he also had gone to Master Cavendish, who had a fine library, to borrow some volumes to take with him down to Greenwich.

Brandon informed me he was to go to Greenwich that day, so we determined to see a little of London, which was new to him, and then take boat in time to be at the palace before dark.

That evening, upon arriving at Greenwich, we hunted up Brandon's uncle, the Master of Horse, who invited his nephew to stay with him for the night. He refused, however, and accepted an invitation to take a bed in my room.

The next day Brandon was installed as one of the captains of the king's guard, under his uncle, but with no particular duties, except such as should be assigned him from time to time. He was offered a good room on one of the lower floors, but asked, instead, to be lodged in the attic next to me. So we arranged that each had a room opening into a third, that served us alike for drawing-room and armory.

Here we sat and talked, and now and then one would read aloud some favorite passage, while the other kept his own place with finger between the leaves. Here we discussed everything from court scandal to religion, and settled to our own satisfaction, at least, many a great problem with which the foolish world is still wrestling.

We told each other all our secrets, too, for all the world like a pair of girls. Although Brandon had seen so much of life, having fought on the continent ever since he was a boy, and for all he was so much a man of the world, yet had he as fresh and boyish a heart as if he had just come from the clover fields and daisies. He seemed almost diffident, but I soon learned that his manner was but the cool gentleness of strength.

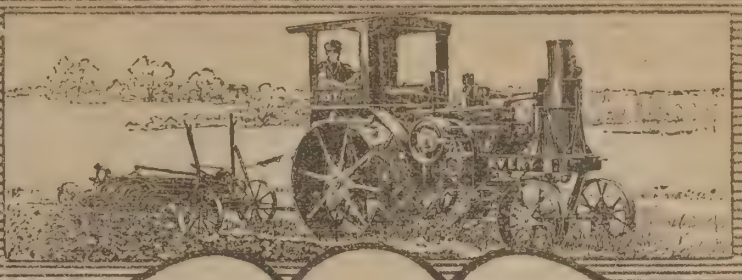
Of what use, let me ask, is a friend unless you can unload your heart upon him? It matters not whether the load be joy or sorrow; if the former, the need is all the greater, for joy has an expansive power, as some persons claim steam has, and must escape from the heart upon some one else.

So Brandon told me of his hopes and aspirations, chief among which was his desire to earn, and save, enough money to pay the debt against his father's estate, which he had turned over to his younger brother and sisters. He, as the eldest, could have taken it all, for his father had died without a will, but he said there was not enough to divide, so he had given it to them and hoped to leave it clear of debt; then for New Spain, glory and fortune, conquest and yellow gold. He had read of the voyage of the great Columbus, the Cabots, and a host of others, and the future was as rosy as a Cornish girl's cheek. Fortune held up her lips to him, but—there's often a sting in a kiss.

CHAPTER III.

Now, at that time Mary, the king's sister, was just ripening into her greatest womanly perfection. Her skin was like velvet; a rich, clear, rosy snow, with the hot young blood glowing through it like the faint red tinge we sometimes see on the inner side of a white rose leaf. Her hair was a very light brown, almost golden, and fluffy, soft and fine as a skein of Arras silk. She was of medium height, with a figure that Venus might have envied. Her feet and hands were small, and apparently made for the sole purpose of driving mankind distracted. In fact, that seemed to be the paramount object in her creation, for she had the world of men at her feet. Her greatest beauty was her glowing dark brown eyes, which shone with an ever-changing luster from beneath the shade of the longest, blackest upcurving lashes ever seen.

Her voice was soft and full, and, except when angry, which, alas, was not infrequent, had a low and coaxing little note that made it irresistible; she was a most adroit coaxer, and knew her power full well, although she did not always plead, having the Tudor temper and preferring to command—when she could. As before hinted, she coaxed her royal brother out of several proposed marriages for her, which would have been greatly to his advantage; and if you had only known Henry Tudor, with his vain, boisterous, stubborn violence, you could form some idea of Mary's powers by that achievement alone.



Will Sommers, the fool, one day spread through court an announcement that there would be a public exhibition in the main hall of the palace that evening, when the Princess Mary would perform the somewhat alarming, but, in fact, harmless, operation of wheedling the king out of his ears. This was just after she had coaxed him to annul a marriage contract which her father had made for her with Charles of Germany, then heir to the greatest inheritance that ever fell to the lot of one man: Spain, the Netherlands, Austria, and heaven only knows what else.

She had been made love to by so many men, who had lost their senses in the dazzling rays of her thousand perfections—of whom, I am ashamed to say, that I, for a time, had been insane enough to be one—that love had grown to be a sort of joke with her, and man, a poor, contemptible creature, made to grovel at her feet. Not that she liked to encourage it; for, never having been moved herself, she held love and its sufferings in utter scorn. Man's love was so cheap and plentiful that it had no value in her eyes, and it looked as if she would lose the best thing in life by having too much of it.

Such was the royal maid to whose tender mercies, I now tell you frankly, my friend Brandon was soon to be turned over. He, however, was a blade of very different temper from any she had known; and when I first saw signs of a growing intimacy between them I felt, from what little I had seen of Brandon, that the tables were very likely to be turned upon her ladyship. Then thought I, "God help her," for in a nature like hers, cahrged with latent force, strong and hot and fiery as the sun's stored rays, it needed but a flash to make it patent, when damage was sure to follow for somebody—probably Brandon.

Mary did not come home with us from Westminster the morning after the joustings, as we had expected, but followed some four or five days later, and Brandon had fairly settled himself at court before her arrival. As neither his duties nor mine were onerous, we had a great deal of time on our hands, which we employed walking and riding, or sitting in our common room reading and talking. Of course, as with most young men, that very attractive branch of natural history, feminology, was a favorite topic, and we accordingly discussed it a great deal; that is, to tell the exact truth, I did. Although Brandon had seen many an adventure during his life on the continent, which would not do to write down here, he was as little of a boaster as any man I ever met, and, while I am in the truth-telling business, I was as great a braggart of my inches as ever drew the long-bow—in that

(Continued on page twenty-six.)

The Only Standardized Tractor Design

Avery Tractors are the only make built in five sizes (a size for every size farm) all having exactly the same design. There is practically no other make of tractors where there are more than two sizes of the same design.

When the Avery Company builds one size tractor and after thoroughly testing it out, builds another size, and then another, and then another, and then another, until it has five sizes of all exactly the same design, it is unquestionable proof of the success of that design.

Genuine Kerosene Burners

Opposed motor, strong crankshaft, renewable inner cylinder walls, patented sliding frame, all spur gear transmission, no intermediate gear or shaft, no counterweights on crankshaft, no water pump, no fuel pump, no fan, no mechanical lubricator, no belts, no sprocket chains. Regular sizes—8-16, 12-25, 18-36, 25-50 or 40-80 h.p. and special 5-10 h.p. **There's a size Avery Tractor and Plow to fit every size farm and a size Avery Thresher to fit every size run.** The Avery Company has its own Branch Houses at convenient points, large repair stocks and force of trained service men to serve owners of Avery Tractors. Write for a free copy of the new 1917 Avery Catalog and name of nearest dealer.

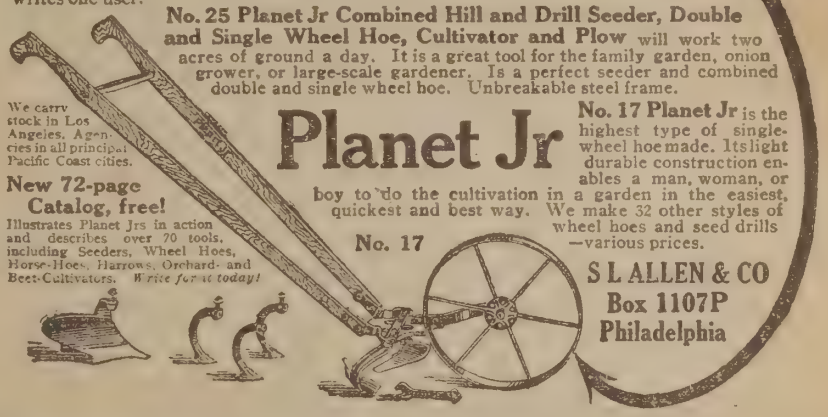
AVERY



Tractors and Plows—6 Sizes—Fit Any Size Farm

These tools do the work of 3 to 6 men

One man can cultivate 3 to 6 times the usual acreage with Planet Jr implements. They are so ingeniously designed and scientifically constructed that with greatest ease they do thorough, rapid cultivation. Fully guaranteed.

"I'd rather have my Planet Jr Seeder during the season than an extra man," writes one user.

No. 25 Planet Jr Combined Hill and Drill Seeder, Double and Single Wheel Hoe, Cultivator and Plow will work two acres of ground a day. It is a great tool for the family garden, onion grower, or large-scale gardener. Is a perfect seeder and combined double and single wheel hoe. Unbreakable steel frame.

We carry stock in Los Angeles. Agencies in all principal Pacific Coast cities.

New 72-page Catalog, free!
Illustrates Planet Jrs in action and describes over 70 tools, including Seeders, Wheel Hoes, Horse-Hoes, Harrows, Orchard- and Beet-Cultivators. *Write for it today!*

Planet Jr

No. 17 Planet Jr is the highest type of single-wheel hoe made. Its light durable construction enables a man, woman, or boy to do the cultivation in a garden in the easiest, quickest and best way. We make 32 other styles of wheel hoes and seed drills—various prices.

Is Direct Legislation a Failure?

Is It to Be "Unless You Fully Understand the Measure, Kill It"?

By E. A. BRYAN, Pullman, Wash.

Is direct legislation a failure? Will every bill initiated or referended be defeated? Is the dictum, "Unless you fully understand the measure, kill it," to prevail? Is only destructive and not constructive legislation possible under the system?

The outlook is discouraging indeed, but not conclusive evidence of failure. Lately one great branch of the temperance party, intelligent, conscientious, constructive in its desires, attempted to initiate a temperance measure, the purpose of which was generally acceptable. Another great branch of the party, similarly intelligent, conscientious and constructive, employs a shrewd and experienced lawyer to examine the details and the working of the bill and announces that the lawyer pronounces it defective and dangerous to the ends in view. Forthwith, opposition is announced, and temperance people, either accepting the pronouncement of the lawyer as final, or discouraged as to the probability of success, drop the whole matter.

In either case the people were not trusting themselves on the matter of detail, but were trusting a few—a very few, or even a single person—to decide for them. There is the difficulty, therefore, under the system, that after all, the determination of proposed laws may be left in matters of detail to the leadership of the order or party, or group desiring to initiate the measure; and the followers give their support on their faith in their chosen leaders, rather than on their understanding and support of the proposed measure.

Nay, more, since groups sometimes combine in order to throw the united strength of their organization for certain measures, these measures may be merely the result of a compromise, and even the leaders may not be able to vouch for the measures of other allied organizations. The confusion of mind and the uncertainty thus arising, together with the difficulty on the part of the average voter in understanding legal phraseology leads to the very general conclusion, "I do not fully understand the measure, and therefore I am against it."

As a matter of fact, tens of thousands of voters never give even a single reading either to an initiated or referended measure. They decide either on the basis of their group leadership, the title or name of the measure, or on the principle, "Not understanding, I am against it." What, then, are the lessons thus far?

For initiated measures, it certainly is that they should be short and simple in their statement, and broad and constitutional in their character. Such questions as whether a state shall be wet or dry, whether we shall elect United States senators or president by popular vote or not, whether or not women shall be enfranchised, and similar simple, broad, fundamental questions may be successfully initiated. Complex, detailed statutes will be defeated. The referendum can be used much more broadly. The negative side will generally prevail. Perhaps on that very account the affirmative vote should be that "the will of the legislature shall not prevail."

"Safety first" is a good slogan, but it should not prevent the duty of thinking and of constructive legislation.

As yet then we have not achieved the ideal system. We have not escaped the necessity of leadership and delegated responsibility. We are, perhaps, groping toward the light, but we have not yet found it. We have escaped some of the dangers, but have encountered others. Let us hope that the light will appear.

Club of No Clique or Family

Community Meetings and Festivities in Rockies

By N. A. LYMAN, Sula, Mont.

Shut off in a fertile valley of the Rockies, until the automobile changed conditions, the valleys of Ross' Hole and French Basin developed a community life that has been one of the great pleasures of life in the valley. For years the community festivities and gatherings have been noted. Community dinners, dances and other amusements have been held and attended by all. As the population increased, the schoolhouse, which until the last few years had been the general meeting place, became too small and need was felt for some better accommodations, if the community spirit was to be fostered and strengthened. With this need in mind, the idea of the country life club and clubhouse took birth.

As a result of this need, in January, 1914, a country life club was organized, and plans made for building a suitable clubhouse.

It was decided that the epenxse of this be borne by the members of the community in proportion to their ability.

Each member was therefore asked to donate either money, material or labor in such proportion as he was able.

The work was pushed forward rapidly. In less than six months a substantial and comfortable clubhouse was erected and in use. It was located on an ample tract of land donated for the purpose, and, when finally completed, will have cost the community about $1200.

Much of this cost was given in direct donations at the start. Later, the ladies of the club, by basket socials, dinners and other social functions, raised much of the money needed to complete it, and have decorated it inside in a beautiful manner, secured a piano, chairs, tables, lamps and other furniture necessary to the use of a clubhouse, until it is now equipped for all the purposes of the club.

The clubhouse has now been in existence and in use for over a year and a half. During that time there have been many uses found for it. Every matter of business in which the community is interested is there discussed, and meetings of all kinds find it a convenient place for assemblage. Stock meetings, equity meetings and political rallies have been held there, and business of all kinds has been conducted in the clubhouse.

But more important than the use as a meeting house have been the festive gatherings of the community that the clubhouse has encouraged and made possible.

In its short history the clubhouse has already held a Fourth of July celebration, the Lewis and Clark picnic, a community Christmas tree, Washington's birthday party and a Thanksgiving dinner.

Besides these, there have been many dances and smaller social gatherings, and throughout, in all of these gatherings, the entire community has been welcome and expected. The club is the club of no clique or family, but the club of the entire community. It has been open to all, and a benefit and pleasure to all. It has meant much to the community.

The first officers of the club were: N. A. Lyman, president; Albert Wetzsteon, vice president; Mrs. N. A. Lyman, secretary; William Wetzsteon, treasurer; Edgar Blake, John Wetzsteon and George Wetzsteon, trustees.

The club has been prosperous throughout and has carried its activities even further than was at first anticipated. It is now planning on extending its activities.

There is a movement on foot to secure and preserve five acres near by, in one of the most beautiful canyons of the Rockies, as an amusement park, where ball games and all of the usual amusements can be enjoyed.

It has proved the greatest movement for the betterment of the community life that has come to the valley, and now, when the automobile has to a great extent come to change and disrupt the small community life, the Sula Country Club house has held the community together, and the small festivities that meant so much in the years of isolation are relished and enjoyed as in the days before the automobile came to annihilate distance.

"SIX FOR THE FEET."
Restaurant Order in Chicago.

"Six for the feet!" yelled William, the waiter.

"Coming up," came the echo from the kitchen.

Smilingly, Jean, the chef, placed half a dozen hard, inedible objects in the oven, says the Chicago Herald. Thirty minutes later he opened the door, and, wetting a forefinger, tapped one of them. There was a sizzle and a little puff of steam.

"Done to a turn," he mused.

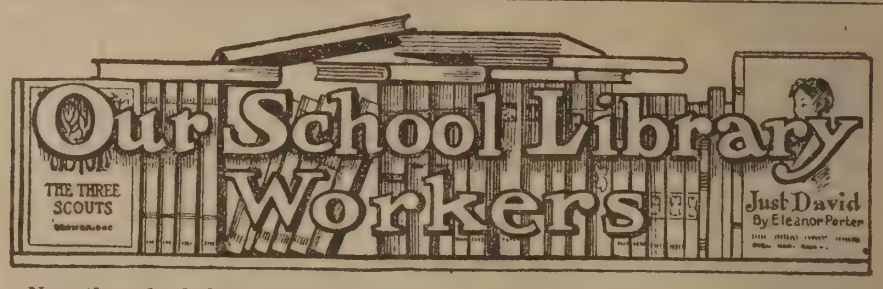
The front door opened and six merry misses from the Monroe telephone exchange entered the restaurant.

William disappeared in the rear and reentered, struggling with a heavily laden tray, a broad grin on his face, which was red with exertion.

Beneath each small table he placed two hot bricks, which chased the chills from neat feet resting comfortably upon them.

"Some service," said the owners of these extremities, beaming thanks.

William's grin grew, and his whistling would have drawn a caustic comment from Jean—if Jean hadn't been whistling himself.



SIGHTS IN BERLIN
Women Do Much of the Work.

Under Friedrichstrasse they are building a big tunnel for the underground railway. Steam shovels and pile drivers are at work, dummy trains are running underground, carrying away the dirt which is being excavated.

If the visitor looked down one of the entrances or watched the workers come up for their noonday meal, he would see a change; 90 per cent of the workers are women, says a correspondent. Women run the little trains, dig the tunnels, shovel the dirt, run the steam shovels and do almost anything. And they are all big, healthy German women, who do the work almost as well as the men did it formerly.

Cooking Utensil Device.

A clip has been invented for holding a spoon on the edge of a cooking utensil or medicine glass.

Now that the holiday season is over and Santa Claus has retired into his castle in the land of Far Away to think what new presents to bring on his next trip, the boys and girls will be able to do a lot of good work for the Red and Blue library teams.

Bonser school has 11 loyal workers, who are letting every one in their district know they are out for a library and intend to get it. Margaret White, their teacher, tells us that the library teams are going to give a school entertainment in the near future, to which every one will be invited. This will greatly aid their library campaign. They are already having fine success, but the entertainment will give their efforts just the touch of local interest needed to secure a fine list of books.

Zillah school has its library campaign nicely under way. There are several rooms in this school, and the enthusiasm is universal. Helen L. Jenks, one of the teachers, reports a fine start has already been made by the third and fourth grades and they expect with the aid of two other rooms to send soon for their first unit of books.

Our 1917 "435 Book Special" school library announcement we know will interest you. The printed list of books should reach each school within the next few days. If they do not, notify us at once and the list will be sent. This list includes the famous works of the world's best literature. Scott, Irving, Corelli, Hawthorne, Byron, Dickens, Prescott, Longfellow, Browning, Cooper, Kipling, Emerson, Ebers, Dumas, Verne, Headley, Lamb and a score of other famous writers speak through this list.

Truly there will be a big army of boys and girls who will be delighted when the books arrive at their schools. The knowledge that each had a part in the work to obtain them will add to the interest in each book secured.

HONOR ROLL.

Bonser school—Lambert T. Goin, Marguerite Goin, Eva Wees.

Zillah school—George Brown, Eleanor Donelson, Walter Ware, Robert Faulron, Gertrude Johnson, Oliver McDonald, Winifred Sutter and Mabel Adams.

All the World's a Stage, and All the Men and Women Merely Players

Mourning Over Grave of Comrade

Copyrighted by International Film Service.

The above is just one illustration of the price that the Serbians are paying to win back their country from the hands of the Germans. Two Serbian soldiers are shown in the above picture, mourning over the newly made grave of a beloved companion who has just been placed in his last resting place. They can not help but wonder how soon they, too, will be called upon to give up their own lives for the sake of their country.

Plant Wizard and His Bride.

Luther Burbank, plant scientist of world-wide reputation, and his bride, formerly Miss Elizabeth Waters, who was his private secretary. Burbank is 67 years old and his bride 28 years of age. They were married in San Francisco on December 20.

In the Fire Signal Trench

Copyrighted by International Film Service.

The French soldier shown in one of the foremost trenches must fire signal rockets at night. His position offers a ready target for the enemy.

Gladys C. C. Fries.

E. Roland Harriman, one of the five heirs to the great fortune left by E. H. Harriman, financier and railroad owner, is to wed Gladys C. C. Fries of New York, one of the most beautiful young women of society. The wedding will take place after Harriman's graduation from Yale with the class of 1917. Like all the weddings of New York's social lights, especially those claiming relationship to persons of fame, the Fries-Harriman romance is attracting widespread interest, not only in New York, but also in New Haven.

German Emperor Visits Troops

The above photograph shows Kaiser William of Germany at the front. The kaiser frequently visits the various fronts and thus comes in personal contact with his troops. In this picture may be seen a German soldier who has brought distinction upon himself by his heroic conduct in action. He is being presented to the emperor.

—Pittsburg Dispatch.

What Momentous Happenings Will Be Recorded in the Coming Year?

Pie Making

Is No Longer Dreaded Task

By Alvara P. Williams.

Pie making is no longer the dreaded task it used to be with me since I have adopted a rule for pie crust which was given out by a domestic science expert in a western college. This rule makes crust for two pies or four crusts: Put three-fourth cup shortening in a mixing bowl, pour over this one-half cup boiling water, and beat until creamy. Add the sifted flour mixture—three cups flour, one teaspoon of salt and one teaspoon of baking powder; stir together and roll out. This seems too thin to work with when warm, but it hardens quickly and must be used as thin or soft as can be handled at first.

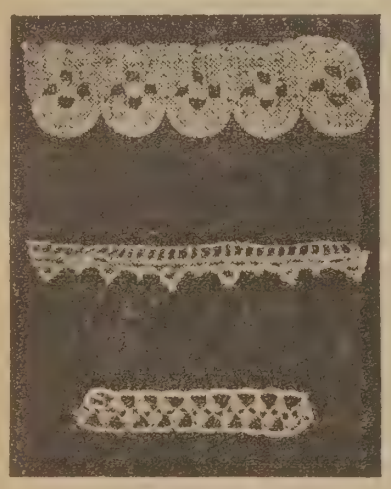
If only part of this rule is wanted, the remaining dough may be wrapped in paraffin paper or a moist cloth and kept until needed. The cold dough makes better crust than when hot. This is a rule used by professional pastry makers, and makes a very flaky crust in about half the time required for the old method.

When making berry pies, or any other kind which is very juicy, the juice can be kept in by putting on "pie bandages," made of a strip of cloth about one inch wide and a little longer than is needed to go around the edge of the pie; this is moistened in cold water and stretched tightly around the pie, lapping over a few inches. About one-half inch projecting above the edge of the pie tin keeps all juice in.

A pie browns quickly and evenly if cold water is sprinkled over it just before putting in the oven.

When all other pie filling fails, try sour milk pie and keep the family guessing what is in it. Take one egg, one cup of sugar, one cup of sour milk, one cup of raisins, one teaspoon of vinegar, one-half teaspoon of cloves, one teaspoon of cinnamon, pinch of salt and stir all together. Bake in two crusts. This needs no soda.

If you have some members of the family who object to meringue on pie or pudding, try beating the white of the egg stiff, as for meringue, and stirring it lightly into the pie mixture just before putting in the oven, baking in one crust, as usual. This may be done with any kind of pie calling for meringue.



To Make Veal Loaf.

Veal Loaf (this dish may be served cold or hot)—Two and one-half pounds of veal, one-half pound of salt pork, two teaspoons of salt, one-half teaspoon of pepper, one teaspoon of chopped onion, one-half cup of cracker crumbs, one-fourth cup of water or stock, one egg, two tablespoons of butter, one-half teaspoon of sage. Chop the veal and pork very fine and add all the other ingredients except the butter. Mix all well together with the hands. Butter a small pan or deep pie tin and press the mixture into it like a loaf, making it about three inches high. Cook for two hours in a rather hot oven, basting with another half cup of water or stock in which the butter has been melted. Serve with the following sauce: Two tablespoons of butter, two tablespoons of flour, one cup of milk, salt and pepper to taste. Heat the butter hot and stir in the flour. When well brown, draw the pan back and slowly add the milk. Boil for three minutes, stirring all the time; add salt and pepper and set back to keep hot. Pour into the sauce the gravy that remains in the pan after baking the loaf, and having stirred the sauce well, turn it over the loaf and serve.

This may be served hot with sauce for dinner or cold for luncheon or supper.

Popular Crochet Designs

By WINIFRED WORTH

Novel Edging.

Looks something like the popular sea shell motif—just enough difference to make it charming and at the same time give you a different motif.

Chain 13.

1st Row—1 t. in 4th st. from hook, 5 t. in next 5 sts., ch. 2, skip 2 sts., 1 t. in next st.. turn.

2nd Row—Chain 6, 3 t. under 2 ch., ch. 2, skip 2 t., 4 t. in next 4 t., turn.

3rd Row—Chain 3, 1 t. in each of 4 t., 3 t. under 2 ch., 2 ch., 15 t. under 6 chain, 1 d. in last st. of foundation ch., turn.

4th Row—One d. in each of 15 t. (back loops), ch. 1, 2 t. under 2 ch., 1 t, in each of 6 t., turn.

5th Row—Chain 3, 1 t. in each of next 6 t., ch. 2, 1 t. in 1 ch. space before scallop, turn, and repeat from 2nd row, for length required, making the 1 d. at end of 15 t., in the ch. space before scallop.

Easy Edging.

Very dainty and narrow, but is quite durable for any purpose. Is very quickly made, and for that reason it appeals to some crochet workers.

Make chain desired length.

1st Row—1 t. in 4th st. from hook, ch. 2, miss 2 ch., 1 t. in next chain st., repeat length of chain.

2nd Row—Chain 1, 4 d. in each ch. of 2 of 1st row, turn.

3rd Row—Chain 4, fasten by sl. st. in 8th st. of d., repeat to end, turn.

4th Row—Chain 1, 8 d. in first ch. of 4, next the hook, 4 d. in next chain of 4 ch. 4, turn and fasten by sl. st. in top of first 8 d. made, ch. 1, turn, 4 d. in ch. first made, ch. 3 picot, 4 d. in same ch., 4 d. in other half of 2nd ch. of 4, repeat to end of work. Leave off ch., work one row of d. into goods, then follow directions from 1st row. You have fine edge without trouble of sewing on. This edge should be worked in fine thread, No. 90 Cordinnet is about right.

Butterfly Wings.

Makes up very prettily for any desired length. Will give finish and the much desired touch to any article on which it may be used.

Chain 6.

1st Row—4 t. in 5 st. from hook, ch. 2, 1 t., in same st., turn.

2nd Row—Ch. 3, 4 t under ch. of 2, 1 t. under same ch. of 2 and continue until desired length. Connect each wing by ch. of 5, and fill up with d. 6 in each space.

Recipes

Good Sauces for Various Meats

Celery Sauce (for boiled fowl)—Wash a head of celery thoroughly, cut in pieces and cook in boiling salted water until tender. Drain. Add enough hot water to that in which the celery was cooked to make a pint in all. Cut the celery in nice small pieces, half an inch in length. Now make a pint of drawn butter sauce, using the pint of water. Add the cooked celery and seasoning and serve.

Cider Sauce (for boiled ham)—Boil two cupfuls of cider five or six minutes, then add half a dozen peppercorns, two cloves, two teaspoonfuls minced onion, a tablespoonful of minced celery and a bit of bay leaf. Cook until reduced one-half, then strain.

Tomato Sauce—Add to one cupful of hot stewed and strained tomato one tablespoonful of butter rubbed with a teaspoonful of cornstarch. Stir until smooth and thickened, add one-half teaspoonful of salt, a few drops onion juice and a tablespoonful of Worcestershire sauce. If too thick, dilute with a little boiling water. A richer sauce is made by putting a pint can of tomatoes into a saucepan with a bunch of seasoning herbs, salt and pepper to taste; add one-half cup of water. Put over the fire, cook about three-quarters of an hour, stirring often. Put a tablespoonful and a half of butter in a saucepan over the fire with a scant tablespoonful flour. Add the strained pulp from the tomatoes and a small cup rich broth, graduating the amount to make the sauce the consistency required.

A Novel Fad.

One of the new fads is to hand knit a border on cape and muff; on the turban, too, if desired—Kansas City Star.

TREES.

I think that I shall never see
A poem lovely as a tree.

A tree whose hungry mouth is prest
Against the earth's sweet flowing breast;

A tree that looks at God all day,
And lifts her leafy arms to pray;

A tree that may in summer wear
A nest of robins in her hair;

Upon whose bosom snow has lain;
Who intimately lives with rain.

Poems are made by fools like me.
But only God can make a tree.
—Joyce Kilmer.

Windmills as Indicators.

Births, marriages and deaths are indicated in Holland by windmills. When a miller is married he stops his mill with the arms of the wheel in a slanting position and with the sails unfurled. His friends and guests frequently do likewise with their mills in token of the ceremony. To indicate a birth the wheel is stopped in a slanting position, but at a more acute angle than that of a marriage, and with the two upper sails unfurled. Should a miller die, the sails of a mill are all unfurled and the wheel is turned round until the arms form an upright cross, in which position they are left until after the funeral takes place.

Production of Camphor.

Forestry experts have found that a plant growing luxuriantly in the Philippines and heretofore thought to be a weed is used in other parts of the far east for the production of camphor.

Sidelights

Considerate of the Police.

"Hello, Police Department? Well, I don't wish to frighten you—but—er—the fact is, I'm sitting on a burglar."—Browning's Magazine.

To Our Credit.

"Now," said the Sunday school teacher, "can any of you tell me what sins of omission are?"

"Yes, ma'am," came the answer. "They are the sins we might have committed and didn't."

Soup Also High.

"My plate is damp," complained a traveler who was dining in a London hotel.

"Hush!" whispered his wife. "That's your soup. They serve small portions in war time."

A Dog's Life.

Elsie—Shall I put on my mackintosh and run out and post these letters, mother?

Mother—No, dear; it's not fit for a dog to be out a night like this. Let your father post them!—Toledo Blade.

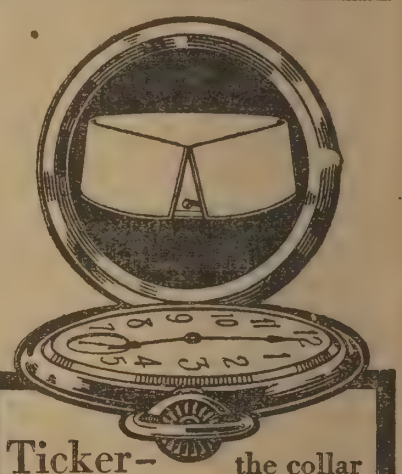
His Part.

"You admit you overheard the quarrel between the defendant and his wife?"

"Yis, sor, I do," stoutly maintained the witness.

"Tell the court, if you can, what he seemed to be doing."

"He seemed to be doin' the listening."



Proving Ma Wrong.

Freddy, with a determined look on his small countenance, marched into the front room and up to the ardent suitor of his pretty sister.

"What's them?" he demanded, thrusting out a grimy hand full of small white objects.

"What are those?" said the young man with an ingrating smile. "Those are beans."

"He does know 'em, ma," bawled Freddy triumphantly into the adjoining room. "You said he didn't."—Ladies' Home Journal.

Industrial Club Work Indorsed

The necessity of continuing the children's industrial club work in the state is strongly urged by Superintendent J. A. Churchill in a report just issued.

He declares it an important factor in the school work of the state and points out the success that it has achieved since its inception in Oregon.

Commenting upon this phase of school work the state superintendent says:

"The children's industrial club work, which is being promoted jointly by the state department of education, the Oregon Agricultural college and the federal government, is meeting with much success and should be continued. In order to stimulate interest on the part of the children and to induce them to take up this work, prizes are offered by the state, as well as by many of the counties and local districts. The reports of the industrial field workers show that literally thousands of Oregon school children are busily engaged during their spare moments at home in some one or more of the projects for which prizes are offered. The club projects number 14, and include corn growing, potato growing, pig feeding, dairy herd records keeping, seed grain selection, fruit growing, baking, canning and preserving, sowing, farm and home handicraft, rural home beautification and the agricultural club project.

Preparing Mangoes.

Mrs. C. H. Wright of Canfield, Idaho, very kindly sends to this department of our paper the following recipe for pickling mangoes. It seems that mangoes and mock oranges are two entirely different vegetables. Mrs. Wright says mangoes are very much like large, green peppers, but are larger and firmer. They are a tender vegetable and should be gathered before the early frosts. They may be put away for winter use as follows:

Cut the top clear around, keeping it in one piece and using later as a cap. Take equal parts of cabbage and green tomatoes and chop. Also chop onions, about one dozen large onions or 18 small ones to a bushel of mangoes. Less onions may be used if preferred. One dozen green sweet peppers chopped fine, salt to taste, a little black pepper, two small handfuls of mustard seed and a dash of cayenne pepper; mix all together, and, after removing the seed of the mangoes, fill the cavities with the mixture. Have ready a five-gallon stone jar; put a layer of the chopped mixture on the bottom and stand mangoes on the mixture with the caps on, putting the small end down. Fill all vacant places with the mixture. When the jar is nearly full cover the whole with vinegar, place a plate over the top and a stone on the plate to keep contents under the vinegar.

A. W. B.

A Bit of Wisdom.

Life is too short to fuss and fret!
To waste the hours in vain regret,
To fancy slights, to bother why
This listener gave a vague reply,
Or that one made some foolish threat.

And, though dull cares our way beset,
To court indifference and let
Each proffered bit of joy slip by—
Life is too short!

But put the world for mirth in debt,
And strive that odds be gaily met;
Humor in every cross espy,
And no least plea for cheer deny;
Then, for the friendliness we get,
Life is too short!
—Charlotte Becker in Life.

Correct Combinations.

In preparing a poultry or game dinner the following is suggested to secure balanced meal:

With poultry or game serve white or sweet potatoes, squash, rice, peas, asparagus, mushrooms, celery or cucumbers, cranberry sause, apple sauce, currant jelly.

With fish serve any of the common vegetables.

Why.

"Why is it that truth will rise again when crushed to earth?"

"Because of its elasticity, of course. Don't you know how easy it is to stretch the truth?"—Boston Transcript.

"Young man, the best tonic for you is the right kind of food. I suggest for Breakfast

Ghirardelli's Ground Chocolate

It's easily assimilated — it's extraordinarily nutritious — and it is supremely delicious."

It comes PROTECTED—as all chocolate should—in ½-lb., 1-lb. and 3-lb. hermetically sealed cans.

When Knighthood Was in Flower

BY EDWIN CASKODEN

(Continued from page twenty-one.)

line, I mean. Gods! I flush up hot, even now, when I think of it. So I talked a great deal and found myself infinitely pleased with Brandon's conversational powers, which were rare; being no less than the capacity for saying nothing, and listening politely for an infinite deal of the same thing, in another form, from me.

I remember that I told him I had known the Princess Mary from a time when she was twelve years old, and how I had made a fool of myself about her. I fear I tried to convey the impression that it was her exalted rank only which made her look unfavorably upon my passion, and supressed the fact that she had laughed at me good humoredly, and put me off as she would have thrust a poodle from her lap. The truth is, she had always been kind and courteous to me, and had admitted me to a degree of intimacy much greater than I deserved. This, partly at least, grew out of the fact that I helped her along the thorny path to knowledge; a road she traveled at an eager gallop, for she dearly loved to learn—from curiosity perhaps.

I am sure she held me in her light, gentle heart as a dear friend, but while her heart was filled with this mild warmth for me, mine begun to burn with the flame that discolors everything, and I saw her friendliness in a very distorting light. She was much kinder to me than to most men, but I did not see that it was by reason of my absolute harmlessness; and, I suppose, because I was a vain fool, I gradually began to gather hope—which goes with every vain man's love—and what is more, actually climbed to the very apex of idiocy and declared myself. I well knew the infinite difference between us, but like every other man who came within the circle of this charming loadstone I lost my head, and, in short, made a greater fool of myself than I naturally was—which is saying a good deal for that time in my life, God knows!

I knew vaguely but did not fairly realize how utterly beyond my reach in every way she was until I opened the flood-gates of my passion—as I thought it—and saw her smile, and try to check the coming laugh. Then came a look of offended dignity, followed by a quick softening glance.

"Leave me oen friend, I pray you, Edwin. I value you too highly to lose, and esteem you too much to torment. Do not make of yourself one of those fools who feel, or pretend to feel, I care not which, such preference for me. You can not know in what contempt a woman holds a man who follows her though she despises him. No man can beg a woman's love; he must command it; do not join their ranks, but let us be good friends. I will tell you the plain truth; it would be no difference were we both of the same degree; even than I could not feel toward you as you think you wish, but I can be your friend, and will promise to be that always, if you will promise never again to speak of this to me."

I promised solemnly and have always kept my word, as this true, gracious woman, so full of faults and beauties, virtues and failings, has, ever since that day and moment, kept hers. It seemed that my love, or what I supposed was love, left my heart at once, frozen in the cold glint of her eyes as she smiled upon my first avowal: somewhat as disease may leave the sickened body upon a great shock. And in its place came the restful flame of a friend's love, which so softly warms without burning. But the burning! There is nothing in life worth having compared with it for all its pains and agonies. Is there?

"Now if you must love somebody," continued the princess, "there is Lady Jane Bolingbroke, who is beautiful and good, and admires you, and, I think, could learn to ——" but here the lady in question ran out from behind the draperies, where, I believe, she had been listening to it all, and put her hand over her mistress' mouth to silence her.

"Don't believe one word she says, Sir Edwin," cried Lady Jane; "if you do I never will like you." The emphasis on the "will" held out such involuntary promise in case I did not believe the princess, that I at once protested total want of faith in a single syllable she had said about her, and vowed that I knew it could not be true; that I dared not hope for such happiness.

You see, I had begun to make love to Jane almost before I was off my knees to Mary, and, therefore, I had not been much hurt in Mary's case. I had suffered merely a touch of the general epidemic, not the lingering, chronic disease that kills.

Then I knew that the best cure for the sting which lies in a luckless love is to love elsewhere, and Jane, as she stood there, so petite, so blushing and so fair, struck me as quite the most pleasing antidote I could possibly find, so I began at once to administer to myself the delightful counter-irritant. It was a happy thought for me; one of those which come to a man now and then, and for which he thanks his wits in every hour of his after life.

But the winning of Jane was not so easy a matter as my vanity had prompted me to think. I started with a handicap, since Jane had heard my declaration to Mary, and I had to undo all that before I could do anything else. Try the same thing yourself with a spirited girl, naturally laughter-loving and coy, if you think it a simple, easy undertaking. I began to fear I should need another antidote long before I heard her sweet soul-satisfying "yes." I do not believe, however, I could have found in the whole world an antidote to my love for Jane. You see I tell you frankly that I won her, and conceal nothing, so far as Jane and I are concerned, for the purpose of holding you in suspense. I have started out to tell you the history of two other persons—if I can ever come to it—but find a continual tendency on the part of my own story to intrude, for every man is a very impotrant personage to himself. I shall, however, try to keep it out.

In the course of my talk with Brandon I had, as I have said, told him the story of Mary, with some slight variations and coloring, or rather discoloring, to make it appear a little less to my discredit than the barefaced truth would have been. I told him also about Jane; and, I grieve and blush to say, expressed a confidence in that direction I little felt.

It had been perhaps a year since my adventure with Mary, and I had taken all that time trying to convince Jane that I did not mean a word I had said to her mistress, and that I was very earnest in everything I said to her. But Jane's ears would have heard just as much had they been the pair of beautiful little shells they so much resembled. This troubled me a great deal, and the best I could hope was that she held me on probation.

On the evening of the day Mary came home to Greenwich, Brandon asked: "Who and what on earth is this wonderful Mary I hear so much about? They say she is coming home today, and the court seems to have gone mad about it; I hear nothing but 'Mary is coming! Mary is coming! Mary! Mary!' from morning until night. They say Buckingham is beside himself for love of her. He has a wife at home, if I am right, and is old enough to be her father. Is he not?" I assented; and Brandon continued: "A man who will make such a fool of himself about a woman is woefully weak. The men of the court must be poor creatures."

He had much to learn about the power of womanhood. There is nothing on earth—but you know as much about it as I do.

"Wait until you see her," I answered, "and you will be one of them, also. I flatter you by giving you one hour with her to be heels over head in love. With an ordinary man it takes one-sixtieth of that time; so you see I pay a compliment to your strength of mind."

"Nonsense!" broke in Brandon. "Do you think I left all my wits down in Suffolk? Why, man, she is the sister of the king, and is sought by kings and emperors. I might as well fall in love with a twinkling star. Then, besides, my heart is not on my sleeve. You must think me a fool; a poor, enervated, simpering fool like—like—well, like one of these nobles of England. Don't put me down with them, Caskoden, if you would remain my friend."

We both laughed at this sort of talk, which was a little in advance of the time, for a noble, though an idiot, to the most of England was a noble still, God-created and to be adored.

Another great bond of sympathy between Brandon and myself was a community of opinion concerning certain theories as to the equality of men and tolerance of religious thought. We believed that these things would yet come, in spite of kingcraft and priestcraft, but wisely kept our pet theories to ourselves; that is, between ourselves.

Of what use is it to argue the equality of humankind to a man who honestly thinks that he is better than any one else, or to one who really believes that some one else is better than he; and why dispute about the various ways of saving one's soul when you are not even sure you have a soul to save? When I open my mouth for public utterance, the king is the best man in christendom, and his premier peer of the realm and next best. When the king is a Catholic, I go to mass; since, praised be the Lord, I have brains enough not to let my head interfere with the set ways of a stone wall.

(To be continued next week.)

Rollie Pollie

He Meets Mrs. White Leghorn

By Laura Pearson Felton.

Rollie Pollie was a little round, red piggie. He lived in a nice pig pen with his mother and brothers and sisters. He had four brothers and three sisters and they had many a big romp together.

Once a long time ago Rollie Pollie sneaked through a hole in the fence and got into a lot of trouble. Perhaps some of you heard about it. Rollie Pollie had a very curious disposition and a roving nature, which led him away from the pen to Rhode Island Red rooster's drinking pan, which he investigated to his sorrow.

You know Rhode Island Red roosters are very quick tempered and poor little Rollie Pollie received a terrible beating. You couldn't really blame Rhode Island Red Rooster, though, because Rollie Pollie did try to get four feet into the pan at once.

Well, after this tragedy, Rollie Pollie was quite a contented little piggie for several days. Then he grew restless again and began to wander around the pen and wish for something exciting to happen. And it happend. You know when we wish hard enough things generally do happen and sometimes we are sorry we wished so hard. Rollie Pollie was, I am sure.

Around and around the pen Rollie Pollie wandered, poking his little red nose into every tiny hole and rooting and grunting as hard as he could. Finally he found a place in the fence where a board was loose. He pushed and pried and grunted and at last squeezed his little fat sides through. My, how he grinned and grunted for joy! He was out in the clover pasture and just beyond was the barnyard with a little trickling, tinkling brook running through it. It was a warm day so Rollie Pollie decided he would go and get a cool drink and wade in the cool water. Down the little hill to the brook he trotted, grunting and trying to wag his little short, curly tail as he went.

Directly ahead of him was a pretty White Leghorn Biddy. She was squatting down on the ground in a funny way, Rollie Pollie thought. Besides being very curious Rollie Pollie was just chock full of mischief. He did love to chase the chickens and ducks and even liked to tease his sisters just to hear them squeal when he nipped their ears.

Now, Rollie Pollie could have turned aside and let Mrs. Biddy alone, but he didn't. Straight toward her he trotted. Mrs. Biddy began to make a funny, clucking sound, but Rollie Pollie never slackened his pace a bit. Then Mrs. Biddy clucked loudly, real cross-like, too, but Rollie Pollie ran straight along in her direction. Mrs. Biddy began to look so fluffy and puffy and to just cluck loud as anything. But Rollie Pollie wasn't afraid. He had made Mrs. Biddy fly from her nest once and he would make her jump up this time, he thought.

But, alas! Poor Rollie Pollie didn't know about the 12 little, fluffy, puffy yellow things Mrs. Biddy was hovering under her white feathers. Neither did he know enough about mother biddies to realize how they will fight to guard their babies. He was only a few feet away from Mrs. Biddy when all of a sudden he saw a big cloud of feathers and a very angry pair of eyes coming straight for him. Behind this bunch of fury Rollie Pollie saw a lot of little yellow puff balls roll around and then he gave a loud squeal and how he did run—past the clucking, spitting mamma biddy he ran—straight toward the creek. He didn't wait to pick his way down the bank, but pell mell he fell into the cold water. Down he went to the bottom, then up he came and floated down stream. He wiggled and kicked and tried to squeal, but the water made him sputter and choke, so he couldn't.

Along the bank Mrs. Biddy ran, all fluffy and clucking as cross as she could cluck. Then over the dam near the barn Rollie Pollie rolled, and down ker plop! into the trout hole where Jimmy came to fish. O, but he was wet and chokey and that water was deep. Poor little Rollie Pollie tried and tried to wiggle over to the bank, but he was weak and tired and scared and couldn't do a thing but just manage to keep his little pink nose above the water. Then he heard Mr. John laugh. That made Rollie Pollie mad, even though he was most too tired to care what happened. What was funny about his being there in the water, he'd like to know. Wasn't he about to drown? Why should Mr. John stand there in the barn door holding his sides and laughing till he was red in the face? Was Mr. John going to let him float past the barn and on out into the big creek?

Just as Rollie Pollie was about to give up in despair and had gone so far he began to see visions of pig heaven he felt Mr. John grab him. Mr. John shook him good and hard and laughed loudly. But Rollie Pollie didn't laugh. He just shivered and shook and coughed and wheezed and tried to get his little cold snout under Mr. John's arm where it was all warm and snugly. He was just beginning to feel a little better when, from around the corner of the barn, he heard a familiar, taunting "Cock-a-doodle-do-o-o!" It was his old enemy, Rhode Island Red Rooster, again, and Rollie Pollie's misery was complete.

OHIO STATE GRANGE

Comes Out for Nation-Wide Law.

At the Ohio State grange, in session at Nwark, the following resolutions were adopted:

Whereas, the governments of Europe have demonstrated that nation-wide prohibition laws are essential in maintaining the high level of military and economic efficiency;

Whereas, it is the sense of the Ohio State Grange that if nation-wide prohibition is necessary for the nations of Europe as a war measure, it is more essential in this time of peace in our own beloved country that we have nation-wide prohibition for the protection of our young manhood and womanhood.

Resolved, That Ohio State Grange indorses the movement now on foot for the resubmission to the electorate of Ohio of the state-wide prohibition amendment.

Resolved, That we favor the joint resolution which will be presented to the congress of the United States this session, calling for the submission to the several states for an amendment to the federal constitution prohibiting the manufacture and sale of intoxicating liquors as a beverage.

L. J. Taber of Belmont county was reelected worthy state master.

Dakotas Will Try Hemp.

Plans for the lease of 5000 acres of land in the Red river valley by the International Harvester company to demonstrate to farmers of the region the possibility of hemp raising is announced by representatives of the concern. The company also will lease a small tract near Aberdeen, S. D., for similar experiments.

Field Crops of England, 1916.

The preliminary estimate of the production of field crops in England and Wales, as issued by the English board of agriculture on November 1, shows that the total yield of wheat in England and Wales for 1916 is 55,540,472 bushels, of barley 41,740,592 bushels, of oats, 83,689,312 bushels, of beans 6,900,976 bushels, of peas 2,081,032 bushels, and of seeds and meadow hay 8,837,079 long tons, which is 2 1-4 million tons, or 24 per cent, more than last year. The production of wheat is about 12 million bushels less than last year, but greater than in 1912 or 1913. The yield per acre, 29.05 bushels, is about 2 bushels below that of 1915 and 2.84 bushels below the decennial average for 1906-16. Oats are only slightly below the average and are slightly better than last year. Barley, although about 1 1-2 bushel per acre below average, is better than last year, and, with the acreage increased, has given a total nearly 5,600,000 bushels in excess of 1915. Oats are only very slightly below the average, and slightly better than last year; the total production, 83,689,312 bushels, is the largest since 1910.

My Dear Children: I am so proud of you and glad that you wrote so many letters and did so well. It broke my heart almost not to be able to give so many nice letters a place of honor and we have had a great many letters—the Corner is growing fast. I wonder what the editor will do with us. We are like little boys and girls that outgrow their clothes—they have to have bigger ones, and so our cornrer is getting too big for its place.

There is not one of you who can not win a prize if you try real hard. Write on one or more of the subjects given; write on one side of the paper only; do your work neatly and try to spell the words correctly. Though many of our cousins are quite young in years, yet many of them write more beautiful letters than the older ones. Be sure that you sign your names and addresses.

I will have something very important and nice to tell you before very long, but I must not tell you yet—it is a secret.

The subjects for the new contest are:

My Best Friend.
The Worst Day.
My First Surprise.

The prize winners for November and December will be found below. AUNT NELLIE.

Prize Winners.

Berthold Conrad, Rt. 1, Box 44, Renton, Wash.

Helen Nitlack, Trinidad, Wash.

Enis Erickson, Rt. 2, Box 108, Lynden, Wash.

Roll of Honor.

Ida R. Dilio, Buckeye; Agnes Lund, Rochester; Albert Coffey, Hay; Lesle Bergman, Man Zanita; Inez Mildred Gagen, Mt. Vernon; Nellie McGrail, Sixprong; Frank Clinton Saeger, Shelton; Ruby Warren, Elma; Nellie Smith, Albion; Adolph Olsen, Langley; Clara Olsen, Bothell; Harney Norris, Goldendale; Berthile Evelyn Maxson, Walla Walla; Esther Carslin, Wilma Butorac, Northport; Velma Batie, Twisp.

KATHRINE AND FRIENDS RIDE TO SCHOOL IN AUTOMOBILE

Dear Aunt Nellie: I live on a 20-acre farm. I like the farm better than I do the city. I have been reading the Children's Corner every time I could. I read it when my father gets home with the paper. We live three miles from Satsop. We have an auto to take us to school and bring us home again. There are 17 children that go in the auto. We have four cows, six calves, two horses, eight pigs, 13 geese, 37 ducks and about 75 chickens, four canaries, one dog and one cat. We call the dog Laddy and the cat Tom. We also have about 150 rabbits, that are running loose. I like to ride on our horses. I have five brothers and one sister. My sister is the oldest of us children. My brothers are all younger than I. I did some of the garden work this summer. Mama calls me her baby girl, and my papa calls me his little boy. I worked in the hay field with my father. I will be 14 years old February 21. I am in the seventh grade at school. It snowed the other night till the ground was covered with it.—Katherine Borden, Satsop, Wash.

WILMA LIKES CHRISTMAS; GIVE AND RECEIVE PRESENTS

Dear Aunt Nellie: I read the letters in the Children's Corner and like them very much. I live on a 160-acre ranch about 12 miles from Northport. We have 20 head of cattle, two horses, two pigs, four kittens and some rabbits, some chickens, ducks and one dog. We get lots of present on Christmas eve, and we can also give lots of presents. I like them all. I am 11 years old.—Wilma Butoric, Northport, Wash.

THINKS THERE IS MORE FUN ON THE FARM THAN IN CITY

Dear Aunt Nellie: My schoolmate Velma Batie and I thought we would write to the Children's Corner and try to win a prize. My subject that I am going to write on is fun on the farm. I think the farm is the best place to live, although it is quite nice to live in town, too. On the farm we can ride horses, drive the cows to the range and go after them at night. When it is warm we go swimming and wading, which is excellent fun. When it is time for haying we have great fun romping about in the hay, sometimes driving a wagon. Most of us have gardens and flowers to attend to. In the winter we have lots of fun coasting and skating. In the long winter evenings we have lots of fun popping corn and making candy. We have lots more fun on the farm, but I can not recall it to memory at present. I am 14 years old and my birthday was January 11.—Maude Burns, Twisp, Wash.

DUCKS SWAM DOWN RIVER; WERE HARD TO GET BACK

Dear Aunt Nellie: I am a little girl 11 years old and in the fifth grade. I go to the Pleasant school. This is my second term of school. We have no school here on Snake river and I have to leave home to go to school. My teacher's name is Miss Rogers and I like her very much. There were 20 birds' nests in the trees around our house last summer. The reason we have so many birds is because we have no cats. In the summer we have lots of fun, swimming in the Snake river. We also go boat riding. I can row the boat. We raised 104 ducks. One day 60 of them went down the river and we had quite a time getting them back. I have two brothers and one sister. My brothers' names are Frank and Earl, and my sister's name is Marie. We have nine horses, six colts, two cows and three calves.—Clara Judkins, Pomeroy, Wash.

HAD TO CLOSE THE SCHOOL BECAUSE OF MEASLES

Dear Aunt Nellie: I am going to tell you what I can do. I can milk six cows. We have 20 cows and about 13 young stock. I can feed the calves, pigs, chickens, and am learning to cook, wash and iron, sweep and dust, and I go to school. It is about two miles. We ride in a wagon and sometimes I walk and also help mama with the dishes and carry in the water and wood. I am 10 years old and in the fifth grade and my birthday is May 20. There are 42 scholars in our room. There are 250 scholars in the school. School has been closed for some time on account of measles. I like to read the Children's Corner so much so I thought I would write. I have two sisters and one brother, I would like to win a prize.—Nellie May Francis, Clear Lake, Wash.

HAVE LOTS OF WHITE LEGHORN CHICKENS ON LUCILE'S FARM

Dear Aunt Nellie: I am 13 years old and am in the sixth grade. I live on a farm of 320 acres. It is six miles to the town of Othello. We have nine horses and four colts, one cow and calf, three cats, and 17 pigs. The horses' names are Ribbon, Lilly, Bessie, Rub, Mabel, Dick, Bird, Nellie and Queen. The colts' names are Pearl, Tony, Winnie and Buster. The cow's name is Daisy. We have not named the calf. The dogs' names are Don and Frisk. We have about 225 chickens. They are the White Leghorns. I have a horse to drive to school. I go one and a half miles to school. I like the farm. I can tat, crochet, knit and have made my own clothes. I have one brother and one sister. My brother's name is Charles and my sister's name is Helen. My sister is 16 years of age and my brother is 7 years. My birthday is October 4. I like my teacher fine. Her name is Miss Sylvia Miller.—Lucile Lee, box 76, Othello, Wash.

ALL OF THE SALVAGE GIRLS ATTEND SCHOOL EXCEPT BABY

Dear Aunt Nellie: I am 12 years old and in the fifth grade though I did not pass last year. My teacher's name is Mr. Gurnsey. I have four sisters and one brother. My sisters' names are Cora, Effie, Ethel and Gertie. Gertie is the baby, she is 19 months old. My brother's name is Victor. He is 19 years old. I live on an 80-acre farm two and a half miles from town. We have a cow and a calf. We have five sheep and three pigs, and two horses. Our horses' names are Dolly and Snip. All of us girls go to school except the baby. Our school is named Sunnyside. Cora is in the eighth grade. Effie is in the fourth grade, Ethel is in the second grade. It is three-quarters of a mile to our school. We walk to school. The baby is always glad to see us when we come home.—Nellie Salvage, Addy, Wash.

LEONARD WISHES THAT THE COUSINS WOULD WRITE HIM

Dear Aunt Nellie: I would like to correspond with Tommy Booker, and Leanard Christian. I read the letters and like them very much. I have a cat named Jim. His mother died last winter. My subject is school days. I like to go to school. It is fun to play marbles. We play tag. We have four cows and three heifers, nine pigs. I am nine years old now. September 7 was my birthday. My studies are arithmetic, spelling, geography, reading, language, writing and drawing. I have a gun. It is an air rifle. I like December because it is snowy on the ground. My teacher's name is Miss Gillstein. My sister got E in her studies.—Leonard Symington, Kangley, Wash.

LESTER BELONGS TO THE BAND OF MERCY AT SCHOOL

Dear Aunt Nellie: I am 10 years old and my birthday was December 12. I go to school about a quarter of a mile from here. I am in the fifth grade and have a very good teacher. Her name is Miss Jones. I like school for every Tuesday and Thursday we go to the basket ball grounds. There are 27 pupils in our room and 14 in our class. We have very good coasting and sometimes skating. I am a member of the Mercy Band. I am also a member of the school band.—Lester Greenwood, Creston, Wash.

MYRTLE ENJOYED THE BELL DRILL AT SCHOOL PROGRAM

Dear Aunt Nellie: I have four brothers and two sisters. We have eight cows and eight calves, three horses and one old mare. We have three pigs. I am 7 years old and in the third grade. My birthday is February 9. For Christmas we had a bell drill and I thought it was fun. My teacher's name is Mrs. Warren.—Myrtle McKeen, Republic, Wash.

All Ready for a Ride

The accompanying photo shows the little daughter of John G. Hoke of Baker, Ore., mounted and ready for a ride on her favorite "pony." Mr. Hoke is a prominent cattle man of Baker county and had cattle on the Portland market during the Pacific International Stock Show.

HELEN SINCLAIR CAN TAT AND ENJOYS IT VERY MUCH

Dear Aunt Nellie: I will write to the Children's Corner as I have been reading the letters every time we get the paper and have always wanted to join it. I am 12 years old and my birthday is March 8, and I am in the seventh grade at school. I walk to school in the summer, but in the winter I ride. We had a Christmas program and there is another school that joined us. I spoke a piece, "Christmas Has Come." There are only eight pupils in our school. I have three brothers and one sister. Their names are Hugh, Gus, Bailey and Frances. My sister's birthday is December 29. I hope that I win a prize. We have language, spelling, history, physiology, reading, arithmetis and geography. Our teacher's name is Mr. Hill and he is a good teacher. We have a nine-months' term of school. We do not have sewing in school though our teacher said that we would have sewing and manual training. I can tat and like it very much.—Helen Sinclair, Dot, Wash.

ROBERT'S SCHOOL AT THE CORNER OF HIS RANCH

Dear Aunt Nellie: We had 160 acres of land, but we sold some to the railroad and some town lots, so only have about 150 acres left. We have a fine schoolhouse here right at the corner of our land. It has four rooms and a basement under all. We have five teachers, a principal, high school teacher, and three grade teachers. My teacher's name is Miss Ramsey. I have no sisters or brothers. On our farm we have a span of horses that we raised. We have dairy cows, a few pigs, chickens and rabbits. I have a pet kitten named Buffkins. — Robert Davis, Rainier, Wash.

WELCOME LITTLE STRANGER WRITES TO US AGAIN

Dear Aunt Nellie: Here comes a little stranger. This is my first letter and I like to read the Children's Corner and like it very much. I live on a farm and we have 17 cows and 14 calves and yearlings. I go about half a mile to school. I have 10 chickens and they are just beginning to lay. My sister takes The Farmer. I will be 9 years old February 15.—Marie Johnson, Bow, Wash.

LITTLE IRENE WALKS ONE MILE TO SCHOOL EVERY DAY

Dear Aunt Nellie: I am 7 years old November 7. We have a little puppy and a cat who sits in the house all the time. We have seven mules and six horses, four cows, three colts, 12 hogs, and 70 chickens. We walk one mile to school. I am in the second grade. My teacher's name is Clara M. Conner.—Irene Martha Slaughter, Mansfield, Wash.

ATTENDS THE LARGEST NORMAL SCHOOL IN THE STATE

Dear Aunt Nellie: This is the first time I have written to you. My sister wrote to you last time so I thought I would write. I have 46 chickens, 25 pigeons, three rabbits and a dog. I live in the city of Bellingham. I am 11 years old and four feet tall. I go to the largest state normal school in Washington.—Lyle Bartruff, 1120 1-2 Dock St., Bellingham, Wash.

MINNIE HAS A PET ROOSTER, HIS NAME IS REDWING

Dear Aunt Nellie: I am going to write about my rooster. He is a large fellow. He is dark blue and green, the tips of his wings are red, so we call his Chief Redwing. He is as gentle as a kitten. I bring him in the house every morning so he can get his feet warm. He sits in my lap by the stove and never flies around.—Minnie Mullen, Elk City, Idaho.

LIVES CLOSE TO GRANDMA, CAN SEE HER EVERY DAY

Dear Aunt Nellie: I am a little girl 9 years old. I live on a farm of about 125 acres. My papa has two horses and 10 cows. I go to school every day. I am in the fourth grade. I live close to my grandma and I can go to see her every day.—Ruby Swearingen, Drain, Ore.

Solution to Last Chapter of "The Three Little Pigs"

Piggy was both cute and cunning. He hung a kettle full of water over the hearth, and then made a roaring fire, and just as the wolf was coming down the chimney, he took off the lid, and in fell the wolf.

In a second the little pig had clamped the lid on tight, and then he boiled the wolf and ate him for supper.

(End of Tale.)

Grain and Produce Markets

Chicago Grain.

CHICAGO, Jan. 13.—Expectation of a good sized decrease in the United States visible supply tended to uphold the wheat market today. The close, although unsettled, was the same as yesterday's finish to 5-8 off, with May at $1.84 3-8@1.84 1-2 and July, $1.49 3-4 @1.50. Corn gained 5-8 to 5-8@3-4; oats were unchanged to 1-2@5-8 down, and provisions varied from 2 1-2 decline to a rise of 30c.

Nervousness over an evident pause in export demand formed the chief offset to the prospect that the visible supply total on Monday would show a material shrinkage in the available domestic stock of wheat.

Corn had a firm tone throughout nearly the entire day.

Oats followed corn. Trade was local.

Provisions averaged higher owing to an advance in the hog market to the topmost level ever attained in January. A big drop in hog receipts next week is looked for.

Pacific Northwest Grain.

PORTLAND, Ore., Jan. 13.—Wheat—Bluestem, $1.65; fortyfold, $1.60; club, $1.58; red Russian, $1.55. Oats—No. 1, white feed, $36.50. Barley—No. 1 feed, $38.50.

Futures: February—Bluestem, $1.66; fortyfold, $1.61; club, $1.60; Russian, $1.56. Oats—$36.75. Barley—$39.

SEATTLE, Wash., Jan. 13.—Wheat—Bluestem, $1.63; Turkey red, $1.64; fortyfold, $1.60; club, $1.59; fife, $1.55; red Russian, $1.57.

Barley—$39 per ton.

TACOMA, Wash., Jan. 13.—Wheat—Bluestem, $1.63@@1.65; fortyfold, $1.60; club and fife, $1.58@1.59; red Russian, $1.56.

WALLA WALLA, Wash., Jan. 13.—Wheat—Club ,$1.47; bluestem, $1.52, Barley—$38@40.

WILBUR, Wash., Jan. 13.—Bluestem, $1.50; club, $1.45. Oats—$36. Barley—$36.

Farmers here sold 45,000 bushels of wheat the last week at $1.50 the bushel or better.

San Francisco Grain.

SAN FRANCISCO, Jan. 13.—Wheat firm; no trading.

Barley—May, $2.22 1-2 bid, $2.28 asked. December, $1.55 bid, $1.65 asked.

Wool.

LONDON, Jan. 13.—A miscellaneous selection amounting to 8300 bales was offered at the wool auction sales today. Good wools were steady, but inferior grades were slow. New South Wales and Queensland greasy merinos sold at 2s 11d.

BOSTON, Jan. 12.—The Commercial Bulletin will say tomorrow:

"There has been a fair demand for wool in the Boston market this week, both on account of the woolen and worsted manufacturers. Prices have been firm, with a tendency toward higher levels, although no marked advances have occurred. Current business at the mills is moderate. Advices from the west indicate that contracting of the new clip is proceeding slowly at slightly higher prices."

Scoured basis: Texas fine, 12 months, $1@1.05; fine 8 months, 88@90c; California northern, 95c@$1; middle county, 85@90c; southern, 70@75c; Oregon eastern No. 1 staple, $1.05@1.10; eastern clothing, 95@97c; valley, No. 1, 90@92c.

Territory, fine staple, $1.15; half-blood combing, $1.10; three-eighths blood combing, 92@94c; fine clothing, 95c@$1; fine medium clothing, 92@95c.

Pulled extra, $1.05@1.10; fine A, 98c @$1; AA, 90@95c; A supers, 83@85c.

LONDON, Jan. 12.—A good selection amounting to 9000 bales was offered at the wool auction sales today. The demand was quieter and prices were easy, owing to the authorities fixing maximum prices for tops.

Portland Wheat.

PORTLAND, Ore., Jan. 13.—The eastern demand for wheat is said to have been checked, yet buyers are still offering strong prices in the country. One lot of fancy bluestem was bought at an f. o. b. price equal to $1.72 here, which is a record price for wheat in the northwest. At the merchants' exchange closing bids for January wheat were: Bluestem, $1.65; fortyfold, $1.60; club, $1.58; red Russian, $1.55.

Oats also continue very firm. One hundred tons of February oats were sold on the board at the close of the week at $36.75. Barley is nominal, as practically nothing in the feed line is being offered here

The flour market is on a firm basis and a further advance is expected this week

Engaged to One.

Maud—To protect myself against burglars, I'm going to get a six-shooter.

Ethel—I'm going to get a six-footer. —Boston Transcript.

Portland Market.

PORTLAND, Ore., Jan. 13.—Onions were advanced to $5 a sack at country points at the close of the week. Strong outside demand is wholly responsible for the rise, as local jobbers are unable to get this price on the street.

Up to 2 cents a pound is still being offered to farmers for potatoes, and they are now selling freely at the price.

Vegetables of all kinds continue scarce and high. A car of rutabagas, said to be from British Columbia, arrived by way of Seattle.

The egg market has firmed up. Several cars of storage eggs have been shipped east from the northwestern cities and the fresh lay, while increasing, is still far below requirements.

Poultry prices are somewhat easier, but with meats high a cheap chicken market is not expected.

In the following list of quotations the grain, hay, millfeed, hop, wool and hide prices are those paid to producers. The other quotations are prices from jobbers to retailers:

Oats—No. 1, $36.75 per ton.

Corn—Whole, $47; cracked, $48 per ton.

Millstuffs—Bran, $26.50 per ton; shorts, $30.50.

Barley—No. 1 feed, $39; brewing, nominal; rolled, $41@42.

Hay—Buying prices. Timothy, eastern Oregon, $18@21; alfalfa, $17@18; clover, $12.50; grain, $13@15.

Eggs—Oregon ranch, case count, 36@37c per dozen; candled, 38@40c.

Poultry—Hens, 14@17c; ducks, 16@18c; turkeys, live, 20@22c; dressed, 25@26c; geese, 12@14c.

Butter—City creamery, prints, 38@39c per pound; cubes, extras, 35c.

Cheese—Oregon triplets, 20c; Young Americas, not quoted.

Dressed meats—Veal, 14 1-2c; pork, 13c.

Hops—1916 crop, 6@8 1-2c.

Potatoes—Oregon, jobbing price, $1.75@2.25 per cwt.

Onions—Buying price, $5 for country points.

Wool—Eastern Oregon, fine, 24@30c; coarse, 33@36c; valley, 33@35c.

Beans—Small white, 11 1-4c; large white, $11.10 per 100 pounds.

Hides—Salted hides (25c lbs. and up), 19c; salted stags (50 lbs. and up), 15c; green and salted kip (15 lbs. to 25 lbs.), 20c; green and salted calfskins (up to 15 lbs.), 28@30c; green hides (25 lbs. and up), 17c; green stags (50 lbs. and up), 13c; dry hides, 30c; dry salt hides, 25c; dry horse hides, $1 to $2; salt horse hides, $3 to $5.

Spokane Market.

The wholesale prices quoted in the list below are not the prices paid to producers or shippers; they are those charged by the Spokane commission houses to the retail trade for standard produce. The prices quoted for live stock, however, are the prices given to the producer.

Potatoes—Potatoes, $2@2.25 cwt; new potatoes, 15c lb; sweet potatoes, $5.

Apples—Washington apples, cooking, 60c@85c; eating, $1@1.25; Wageners, $1.25@1.35 box; Jonathans, $1.25@1.35 box; Winter Bananas, 80c box; Kings, $1 box; Spitzenburgs, $2 box; Baldwins, 90c box; Delicious, large, $1.75@2.25 box; Rome Beauties, $1.25 box; Winesaps, $1.75@2 box; Y. N. Pippins, $1.75@2 box.

Butter—Blanchard cartons, 40c lb; Medo-Maid, 40c lb; Cascade, 40c lb; Gold Coin, 36c lb; Gold Leaf, 40c lb; Better butter, 40c lb; Hazelwood, 40c lb; Peerless, 38c lb; Jersey Belle, 39c lb; Attalia, 40c lb; Diadem, 40c lb; Jersey, 38c lb.

Cheese—Wisconsin full cream, twins, 28c; triplets, 28½c; Wisconsin limburger, 28c lb; brick cheese, 28c lb; domestic Swiss, 35c lb; western cream, Idaho or Oregon twin or triplets, 24c lb; Young Americas, 26c lb.

Eggs—Fresh local ranch eggs, $12@14; fresh eastern eggs, $12 case; eastern storage eggs, $9.50 case.

Cattle—Prime steers, $5@6.50 cwt; heifers, $5@5.50; cows, $4@5.

Sheep—Wethers, $6@7 cwt; ewes, $5.50@6 cwt; lambs, $9 cwt.

Hogs—Heavy hogs, $9 cwt; light hogs, $9.50@10.

Live Poultry—Springs, 12@13c lb; hens, 10@11c lb; old roosters, 6@7c lb; young ducks, 11@13c lb; geese, 10c lb; tom turkeys, 16c lb; hens, 20c lb; dressed tom turkeys, 28@30c lb.

Hide Quotations.

Green cows and steers—25 lbs. and up, 16½c; salted cured, 19c; green bulls and stags, 13c; salted cured, 15c; kip, 15 lbs. to 25 lbs., 21c; calf skins up to 15 lbs., 30c; dry flint hides, 32c; dry salted, 27c; dry calf skins, under seven lbs., 38c; dry sheep pelts, full wooled, 20-23c; dry shearlings, 10-75c each; green horse hides, $3 to $5 each; dry horse hides, $1 to $2 each.

Seattle Wheat.

SEATTLE, Wash., Jan. 13.—Modification of the embargo by the railways this week, attuned to easier conditions in the car situation, has contributed greatly toward strengthening the wheat market of Washington. Exporters were advised early that the carriers would accept wheat for export, thereby rescinding the prohibitory measure invoked two weeks ago, and as a result considerable grain has started on its way east.

The tense, high market of the last week has been tempting to farmer holders and millers estimate that approximately 5 per cent of the 10 per cent of the crop of 1916 and hold over still remaining in the hands of the original holders has changed hands. The identity of the buyers, however, is lost. It is not known whether local or eastern millers or exporters have the grain. The bulk of the grain sold is of the club variety for which $1.50 was paid.

Less talk among farmers of holding for a $2 Seattle market is heard this week. A calmer view of futures is being taken and while it is felt certain that wheat will go higher the inclination to hold on is lessening. A few farmers will decline to part with their holdings until bids of $2 are made here, but this faction represents only a small percentage of what is left over.

Seattle Market.

SEATTLE, Wash., Jan. 13.—The week comes to a close with all the hopes and predictions of the bull crowd in full swing. Yakima gems are costing jobbers $48@50 on track, and this compels a selling level of $55 strong, with $60 promised for next week. Puget Sound spuds, although shrinking heavily and probably over the summit of their season's demand, are quoted firm at $45.

The east persists in keeping on this market for stock and is willing evidently to waive customary restrictions as to grading rules. From present indications, those who predicted levels of $70 per ton Seattle wholesale basis before the highest note was struck are going to be better prophets than they knew.

Onions are firm at 5@6c, but the demand has decreased with the price elevations.

Butter has apparently reached the peak of the season, as none of the large operators can find reasons for predicting an advance. The cream supply is adequate. Country creamery butter is being offered at prices that preclude the possibility of elevating the city markets, and only a small quantity of stock is required at this time to hold values stationary.

Cheese is quiet at 22c for Oregon and Washington triplets, but jobbers are expressing no anxiety as to their ability to clean up at a profit. There will be no new stock offered until spring and February and March are the customary months here for a brisk movement.

Ranch eggs conditions are firming slightly. Some of the houses boldly sold at 39@40c today, while the bulk was moved at 38c. Buying prices have gradually been warped up to 36@37c. There is no heavy outside demand and dealers are proceeding cautiously, determined to have something beside unwarranted fears or sentiment behind each elevation.

It is estimated that there are between 1500 and 1600 cases of storage eggs still in the hands of Western avenue jobbers and packers.

BUYING PRICES.

Unless otherwise stated the following prices are fixed upon a jobbing basis and are average prices obtained in reports of transactions by jobbers.

The following prices are offered to the producer by the local dealers for delivery in round lots f. o. b. Seattle:

Eggs—Local, 35@37c per dozen.

Poultry—Live hens, fat, over 4 lbs., 17c per lb.; do, 3 lbs. and under, 15c; old roosters, 10c per lb.; springs, 18c per lb.; ducks, 19c per lb.; squabs, large, $3.50 per dozen; geese, fat, 12c lb.; turkeys, live, 24c.

Butterfat—42c lb.; dairy butter, 28c pound.

Beef—Buying price: Prime beef steers, 8c per lb.; cows, fat, 5@6c per pound.

Hogs—Light, 11 1-2@12c per lb.; do, heavy, 10@11c per lb.

Veal—Fancy light, 12 1-2@13c per lb.; do, heavy, 9@10c per lb.

Hides—Salted, 19c per lb.; salt kip, 22c per lb.; salted calf, 32@35c per lb.; green hides, 16c per lb.; salted bulls, 15c per lb.; dry hides (short trim), 32@33c per lb.; dry calf, 12c (under six lbs.), 36c per lb.; bull and dry salts, 4c per lb. less; green bulls, 18c per lb.; dry butcher full wool sheep pelts, 20@23c per lb.

Butter and Eggs.

ELGIN, Jan. 13.—Butter, 35 tubs at 38 1-2c.

CHICAGO, Jan. 13.—Butter—Lower; creamery, 32@33c.

Eggs—Higher; receipts, 3071 cases; firsts, 46@48c; ordinary firsts, 38@42c; at mark, cases included, 39@47c.

Imports Eggs.

Cuba annually imports from 5,000,000 to 6,000,000 eggs, nearly all of them from the United States.

Live Stock Quotations.

At Chicago.

CHICAGO, Jan. 13.—Hogs—Receipts, 15,000; active, 10c to 15c above yesterday's average. Bulk, $10.60@10.80; light, $10.10@10.70; mixed, $10.40@10.85; heavy, $10.45@10.90; rough, $10.45@10.60; pigs, $7.85@9.75.

Cattle—Receipts, 500; steady. Native beef cattle, $7.75@11.80; western steers, $7.50@10; stockers and feeders, $5.50@8.85; cows and heifers, $4.40@10; calves, $9.75@14.25.

Sheep—Receipts, 6000; strong. Wethers, $9.50@10.65; ewes, $7.25@10.25; lambs, $11.60@14.15.

At Omaha.

OMAHA, Neb., Jan. 13.—Hogs—Receipts, 7700; higher. Heavy, $10.40@10.75; light, $10@10.60; pigs, $8.50@9.75; bulk of sales, $10.15@10.60.

Cattle—Receipts, 200; steady. Native steers, $7.50@11.50; cows and heifers, $6.50@8.50; western steers, $6.70@9.25; Texas steers, $6.25@7.65; stockers and feeders, $6.25@9.

Sheep—Receipts, 200; steady. Yearlings, $10@12; wethers, $9@10.25; lambs, $12.60@13.75.

At St. Paul.

SOUTH ST. PAUL, Minn., Jan. 13.—Estimated receipts at the Union stock yards today: Cattle, 200; calves, 25; hogs, 1600; sheep, 25.

Cattle—Prices on practically all grades of killing cattle at the close of the week were about steady with a week ago. Total receipts for the week were approximately 16,500, compared with 14,000 the previous week.

Hogs—Hogs on the final session of the week cashed at unchanged rates. There were only 1600 on hand, and the crop changed hands quickly. The range was from $10 to $10.35, and the bulk was between $10.20@10.30. Pigs held steady. Good hogs closed about 30 cents higher than a week ago, and other kinds were between 15 and 25 cents higher than the same time last week.

Sheep—With only a few head in the division prices were unchanged for sheep and lambs today. The week closes with prices higher than they ever have been before. Lambs were topping at $13.25, ewes at $9.25, wethers at $9.50 and breeding ewes up to $9.25. The lamb market is 25@50c higher for the week, while sheep, especially good ewes, look about a quarter higher than a week ago.

At Portland.

PORTLAND, Jan. 13.—Hogs—Steady; receipts, 310. Bulk of packing grades, $10.10@10.35; heavy packing, $10.40@10.50; heavy butchers, $10.25@10.35; light packing, $10.25@10.35; rough heavy, $9.25@9.50; pigs and skips, $9@9.40; stock hogs, $8.25@8.75; cripples, $8@9.

Cattle—Steady; receipts, 35. Steers, prime pulp fed, $9.50; prime heavy, $8.25@8.50; good, $7.75@8; cows, choice, $7@7.50; medium to good, $6.25@7.25; ordinary to fair, $5.50@6; heifers, $6.25@7.50; bulls, $4@6; calves, $6@10.

Sheep—Steady; receipts, 39. Lambs, east of mountains, $11@11.25; lambs, valley, $10.50@10.75; lambs, good, $9.75@10.25; choice yearling wethers, $9@10; good yearlings, $8.75@9; choice ewes, $8@8.25; heavy ewes, $6.75@7.50.

At Seattle.

SEATTLE, Jan. 13.—Receipts, 186 hogs, 82 cattle. Market strong.

Hogs—Prime light hogs, $10.60@10.75; medium to choice, $10.25@10.40; smooth heavy, $9.75@10.25; rough heavy, $9.25@9.75; pigs, under 150 lbs., $8.50@9.75.

Cattle—Prime light steers, $8.60@8.75; medium to choice, $8.25@8.50; common to good, $6.50@7.50; best cows and heifers, $7.60@7.75; medium to choice, $7@7.25; common to good, $5@6.50; best bulls, $5@5.75; common bulls, $2.50@4.50; calves, $7@9.

Sheep—Prime lambs, $10.25@10.50; good lambs, $9.75@10; wethers, $8.50@9; ewes, $6.50@8.

Spokane Stock Yards Saturday.

Cattle—Receipts 53; market steady. Prime heavy steers, $8@8.35; prime light steers, $7.75@8; good steers, $7.50@7.75; stockers and feeders, $5.25@6; prime cows, $6.50@7.25; good cows, $5.75@6.50; best heifers, $6.50@7.25; bulls, $3.50@5; calves, $6@8.

Hogs—Receipts, 277; market steady. Prime light, $9.85@10.10; prime heavy, $10.10@10.35; prime mixed, $9.40@9.65; rough heavy, $9@9.50; stockers, $6.50@8.

Sheep—Receipts, none; market steady. Prime lambs, $10@10.75; common lambs, $8.75@9.25; best yearlings, $8.75@9.50; good yearlings, $7.50@8.25; best mutton ewes, $6.75@7.75; good ewes, $5.50@6.50.

San Francisco Produce Market.

Potatoes—Rivers, $2.40@2.65; sweet potatoes, cellar stock, $2.75.

SAN FRANCISCO, Jan. 13.—Butter—Fresh extras, 35½c; prime firsts, 34½c; fresh firsts, 34c.

Eggs—Fresh extras, 40c; pullets, 38c.

Cheese—New, 18c; Young Americas, 20½c.

Poultry—Hens, 24@25c; old roosters, 11@12c; fryers, 25@28c; broilers, 27@30c; large, 26c; squabs, $2.25@2.50; pigeons, $1.25@1.75.

Commandeering Wool Crop.

London Live Stock Journal: A matter of vital interest to flock-owners has to do with the commandeering of the future wool crop. It is unfortunate that the administration should not have been uniform throughout the country. Sheep-breeders will, therefore, welcome most strongly the proposal of the National Sheep-Breeders' association to call together the agricultural representatives on the county advisory committees with a view to seeing whether or not some uniform scheme of administration can be instituted in regard to the 1917 clip. Naturally also the flock-owner feels considerably aggrieved at the price at which his wool has been commandeered.

Producers of wool must receive a price for their product in accordance with the cost of its production. Last year the price was based upon an increase of 35 per cent above that ruling for the 1914 clip. The resolution passed by the National Sheep-Breeders' association asks that, owing to the increased cost of production, the woolgrower should receive a substantially higher price for the 1917 clip than for the 1916. This is only reasonable, seeing the enormous appreciation that has taken place in connection with food, labor and cost of cultivation. This position, too, is fully justified by the action of the government in arrangement it has made in regard to the New Zealand wool clip.

It offered the government of New Zealand a price for the 1916 wool clip of 45 per cent above that ruling for 1913-1914 clip. This was refused, but finally the next season's crop of New Zealand has been secured by the home government at an increased price of 55 per cent above the prices ruling for the various qualities of wool clipped in 1913-1914. Therefore it appears not unreasonable that the same treatment should be given to home-growers for their 1917 clip.

Storage Battery Cars.

On some lines the Prussian state railways are using storage battery cars at less expense than steam locomotives or gasoline electric cars.

SEE US FOR ALL KINDS OF TRADES if your property does not suit you. Rogers & Rogers, Spokane.

NEWS FOR BREEDERS

Jersey Special a Great Success

It becomes more and more apparent that the Jersey special train which left the grounds of the Waterloo-Iowa dairy cattle congress with more than 160 prize Jerseys on board bound for the national dairy show at Springfield, Mass., was a great success. It showed the east that the west can breed the best of stock. It gave to city dwellers an idea of the magnitude of the dairy industry and the progressiveness of the men engaged in it, and it blazed the trail for the advance of the dairy cow—the animal that the east must place her reliance upon if she wishes to rebuild her worn-out soils.

At the first stop of the train—Indianapolis—a great celebration was held in honor of the cattle. Following the parade through the main street of the city to the capitol, speeches were made by the governor and lieutenant governor of the state, acting United States secretary of agriculture, Hon. Carl Vrooman, and the dairy commissioners of three middlewestern states. A magnificant banquet followed in the evening. At Columbus, Ohio, the second stop, an even greater ovation was given the cattle and their owners. At Utica, N. Y., the last stop before the National Dairy Show at Springfield, Mass., a monster crowd of dairymen from all parts of the Empire state and New England were assembled. The governor of Vermont made the trip from his home state to extend to the prize herds of the west the welcome of the east. They arrived in Springfield in the pink of condition; and that they were none the worse for their long journey was shown by the fact that two of the herds won the premier breeders' and premier exhibitors' honors, respectively.

To Begin Official Testing.

Charles Ashton & Sons of Tangent, Ore., who purchased 11 head of heifers at the Pacific International Holstein sale, now have about 30 females in milk or soon to freshen. Their herd bull, by Prince Prelly Gelshe and out of a heifer with a good official record, is siring some nice calves. They will begin official testing in the early spring and hope to make some good records.

H. A.

GOLDEN FERN LAD BLOOD.

H. Thiesen & Sons of Milwaukie, Ore., report their cow, Larkwood's Buttercup, has completed a year's official test, producing in 12 months 8655 pounds of milk and 662.21 pounds of butter at the age of 2 years 9 months with second calf. This makes her record second highest in the state for a senior 2-year-old. The record is 9854 pounds of milk and 674 pounds of butter, now held by Stockwell's Larkwood Lady, also owned by the Thiesens. Another cow of the herd, Sightly's Pride, has completed a record as junior 2-year-old of 10,514 pounds of milk and 726.38 pounds of butter. The cows carry a good deal of Golden Fern Lad blood and are to be bred to a young bull with 50 per cent Golden Fern Lad blood.

KENNEDY'S $500 CALF.

Mal Anderson, one of the prosperous cattlemen of the Ashton country, was in Blackfoot and paid the stock farm of M. Kennedy a visit. He was in search of the best Hereford bull that Idaho possessed and was willing to pay the price. After a careful consideration and investigation, he concluded that the best was none too good for him and he bought the pride of the herd that was sired by Kennedy's big bull, that took first prize at the fair last year. The bull that Mr. Anderson bought will be two years next August.

FIRST PRIZE BERKSHIRE.

At the Smithfield Show.

REGISTERED JERSEY CATTLE.

E. H. Thompson has leased his fine farm just south of Chehalis, Wash., to Antone Adolphsen, a prominent dairyman, for a term of five years. Mr. Thompson will erect a new house and will continue to live on the place. Mr. Adolphsen will immediately stock the farm with registered Jersey cattle and registered Berkshire hogs. Mr. Thompson states that during the time the farm is under lease to Mr. Adolphsen many improvements in the place will be made, the fact that the farm management is off his hands giving Mr. Thompson more time to improve his property.

MEDALS FOR PERCHERONS.

C. A. Hunter of Wallowa, Ore., has received four medals from the Percheron Association of Chicago on the horses which he exhibited at the state fair at Salem. The medals are a little larger than a silver dollar, with the Percheron association on the outer circle and across the center is Mr. Hunter's name and class of horse for which the medal is given. They are as follows: Champion mare in open class; mare, three years old and over, bred and owned by exhibitor; champion mare, open class, and champion mare, bred and owned by exhibitor.

GIVING BOOST TO STOCK.

"When the president signed the 640-acre grazing homestead bill there was placed upon the statute books a law which it is believed will accomplish a great deal toward making homes for those who desire to engage in a small way in the live stock industry, and also meet the constantly decreasing supply of sheep and cattle in the public land states," remarked Congressman Addison T. Smith of Idaho in commenting on the provisions of the law.

FINE SOUTH DOWN EWES.

The University of Idaho flock of sheep has been strengthened by the purchase of two very fine South Down ewes and four very fine Lincoln ewes secured at the Portland Stock show from Oregon breeders.

Transportation of Cocoa.

An interesting spectacle in the Africa gold coast country is the transport of cocoa, the bulk of the inland produce being carried on by porters to the railway. Sometimes the roadways as far as the eye can see are one long line of cocoa bags on the heads of hundreds of carriers.

We Will Pay Salary

To Farmer With Rig or Saddle Horse

The publisher of The Washington Farmer wants men to secure and renew subscriptions to this paper in various farming districts throughout the state during the winter months. We are going to pay good salaries to those who can do the work.

We have decided to offer these positions only to farm owners or renters.

We feel sure there are many of our readers who would like to earn some extra cash during the winter months when work around the place is slack.

We want to hear only from those who will be willing to give our proposition a fair trial for at least a month and who will put in good hard licks for good pay. For men or women with these qualifications the opportunity is a splendid one. This work isn't easy; but you can do it and earn a good salary during the winter months, without neglecting your farm chores—without being away from home more than a few hours each day. We give you full instructions and the right kind of help.

You will be able to earn a salary of from $25 to $150 per month or even more, dependent upon the amount of time and effort you can give to the work. Salary check will be sent promptly at the end of each month.

We will not consider an applicant who does not live on a farm and who does not have a rig, saddle horse or automobile. In writing us tell whether married or single, whether you own or rent your place and give the names of two merchants with whom you trade. There isn't any red tape about our proposition, but we must know something about those workers we put on our payroll to receive a monthly salary check.

Give full details in your first letter. If we get two or more applications from one neighborhood, the first will be given the preference in making our appointment. If you want a good salary proposition for the rest of the winter, don't wait till tomorrow to write us, but send your application today.

If not interested personally in the above proposition, why not get some neighbor or friend in touch with us at once who you think will appreciate an opportunity to make several hundred dollars during the winter months. You will be doing both him and us a favor.

Address your letter to Publisher The Washington Farmer, Review Building, Spokane, Wash.

Eight Hundred Wool Growers Meet at Salt Lake

National Convention Asks Government for Cooperation With Industry

One of the greatest meetings from the standpoint of attendance in the history of the live stock industry of the United States was held at Salt Lake City, Utah, January 11-13, when the National Wool Growers' association met in convention. Eight hundred delegates were in attendance. Every state west of the Rocky mountains and all the live stock states in the entire union were represented. The state of Idaho led in attendance with the exception Utah, the home state of the convention. Idaho had 150 delegates, Montana 125, Oregon 50 and Washington slightly less than Oregon.

F. M. ROTHROCK.

One of the active delegates at the Salt Lake convention was F. M. Rothrock of Sprague, Wash., breeder of both sheep and cattle. He was elected a member of the executive committee of the association.

FRANK R. GOODING.

Former Governor Gooding of Idaho was one of the most prominent men attending the wool growers' convention. Owing to an indisposition on the part of President Hogenbarth, Mr. Gooding presided. He was formerly president of the association.

Urge National Fight on Wild Animals.

The convention discussed at length the problem of ridding the country of predacious animals, especially the coyote, and adopted a resolution asking congress to appropriate $300,000 as a fund to finance a campaign against these pests. Western state legislatures are also urged to take action looking toward the extermination of animals that prey upon sheep. This action was taken more enthusiastically in view of the spread of rabies throughout the country, it being believed that a large percentage of the coyotes on the ranges are affected. Nationwide uniformity in bounties was advocated.

Forest Grazing Fees Discussed.

President F. J. Hogenbarth, in his annual message to the growers, pointed out that the grazing fee collected by the government for forest reserve privileges granted to sheep men totaled now over a million and a quarter dollars annually, and that the proposed increases would practically double this amount.

Consider New Homestead Measure.

The 640-acre homestead law was also discussed largely, finding little favor with the sheep men, who in some cases expressed the belief that the injury done by it to the sheep industry was greater than the benefit that it would result in to the homesteader. They believed that in many instances lands were being taken up under the provisions of the act that were incapable of production sufficient to maintain a homesteader and his family.

Want Government Experimentation.

President Hogenbarth criticized the government for having refused to appropriate $30,000 asked for some time ago for a sheep breeding experiment station. An appropriation of $8500 was made, but this was declared to be insufficient. A station to experiment in sheep feeding is also desired.

Great Sale of Breeding Stock.

The association is planning a larger sale of breeding sheep this season than ever before. Last summer's sale consisted of 2455 head, the highest prices being paid for a Butterfield ram, which brought $1000. Others sold at from $300 to $800. The sale this year will include at least 4000 head, it is predicted, and in view of the unusually high prices of both sheep annd wool it is expected that some high sales will be recorded.

All the present officers were reelected, as follows: F. J. Hogenbarth, Salt Lake, president; S. W. McClure, Salt Lake, secretary; F. D. Miracle, Helena, Mont., treasurer. The executive committee consists of Hugh Cameron, Arizona; Fred Ellenwood, California; Pregor Miller, New Mexico; L. E. Thompson, Colorado; Hugh Woods, Idaho; O. E. Selway, Montana; J. C. Kinney, Wyoming; Thomas Austin, Utah; F. M. Rothrock, Washington; T. M. Burgess, Oregon; Mr. Kimball, Nevada.

Figures vs. Frivolity

Being an Earnest Appeal to Contestants to Stick to Figure Problem

By the Contest Editor

The Contest Editor is desirous that those who are interested in the Figure problem confine their questions as nearly as possible to points immediately concerning the contest. While he does pretend to know something about the kind of figures that relate to the solution of this problem, the Contest Editor is not an encyclopedia and knows little either of fads, fancies or history. It is his desire to be as courteous as he can well be with all contestants and will try to answer their questions on whatever subject, but again appeals to them to avoid irrelevant inquiries.

ANSWERS TO MAIL.

(It being physically impossible to write personal answers to all questions, this method is taken of replying briefly, with due apology to our contestants.—Contest Ed.)

G. Z.—Not the number of figures but the correct total of all the figures in the chart when added is the solution necessary in this contest.

MARMALADE—Immortelles for a bridal bouquet suggest a permanency of the marital contract which is the good luck most to be desired. No, the 13th is not an unlucky wedding day if the young man is the right sort of fellow and you are willing to do your part.

CONSTANCE—Personal friendship would be no valid excuse for my confiding to you the correct solution of figure problem. No, my recollection is that Catherine of Arragon, not Laura Jean Libby, was the sole surviving wife of Henry VIII.

JEWEL—The author of the following verse, submitted by you, is understood to be in hiding:

He met her in the meadow
  As the sun was sinking low;
They walked along together
  In the twilight's afterglow;
She waited until patiently
  He had lowered all the bars,
Her soft eyes bent upon him
  As radiant as the stars.
She neither smiled nor thanked him,
  In fact she knew not how,
For he was but a farmer's lad
  And she—a Jersey cow.

T. F.—Yes, if your subscription is already paid in advance, you can enter the solution by paying either $1 or $1.50, for which your subscription will be extended from the time to which it is now paid.

PERSIS—Decline to answer your qusetion about divorce. My business is addition, not subtraction.

F. M. R.—All prizes in the Figure contest will be paid in cash.

THANK YOU.

The Contest Editor is proud of the following letter from a subscriber at Lewiston, Idaho:

Dear Contest Editor:

I consider it a treat to have a chance to secure your most valuable Farm paper at three years for $1.50. I want to try for some of the prizes offered for best solution of figure chart.

I was born and raised on a farm, but find the paper very helpful. While I am only working for wages, it helps me to give my employer better service. I lived in Oklahoma 18 years and though the———Farmer the only farm paper, but like this paper better.

The adding up of the figures looks easy, but there may be some one who can't see well.

I wish to say I am a common laborer with a family and an aged father and mother to support and decided the prize worth while trying for, but I feel if I apply a good portion of the Farmer's suggestions, hard work and economy, I will win in Idaho.

Wishing you success with the best Farm paper in the west, I am,

$750—Prizes—$750

First Prize, $200

to which will be added 50 times the amount paid by the subscriber with the winning solution. For example, if you pay $1.50 on subscription, this prize will be worth $275.

Second Prize, $100

to which will be added 30 times the amount paid by the subscriber with the winning solution. This prize may be worth $145.

Third Prize, $60

to which will be added 20 times the amount paid by the subscriber with the winning solution. This prize may be worth $90.

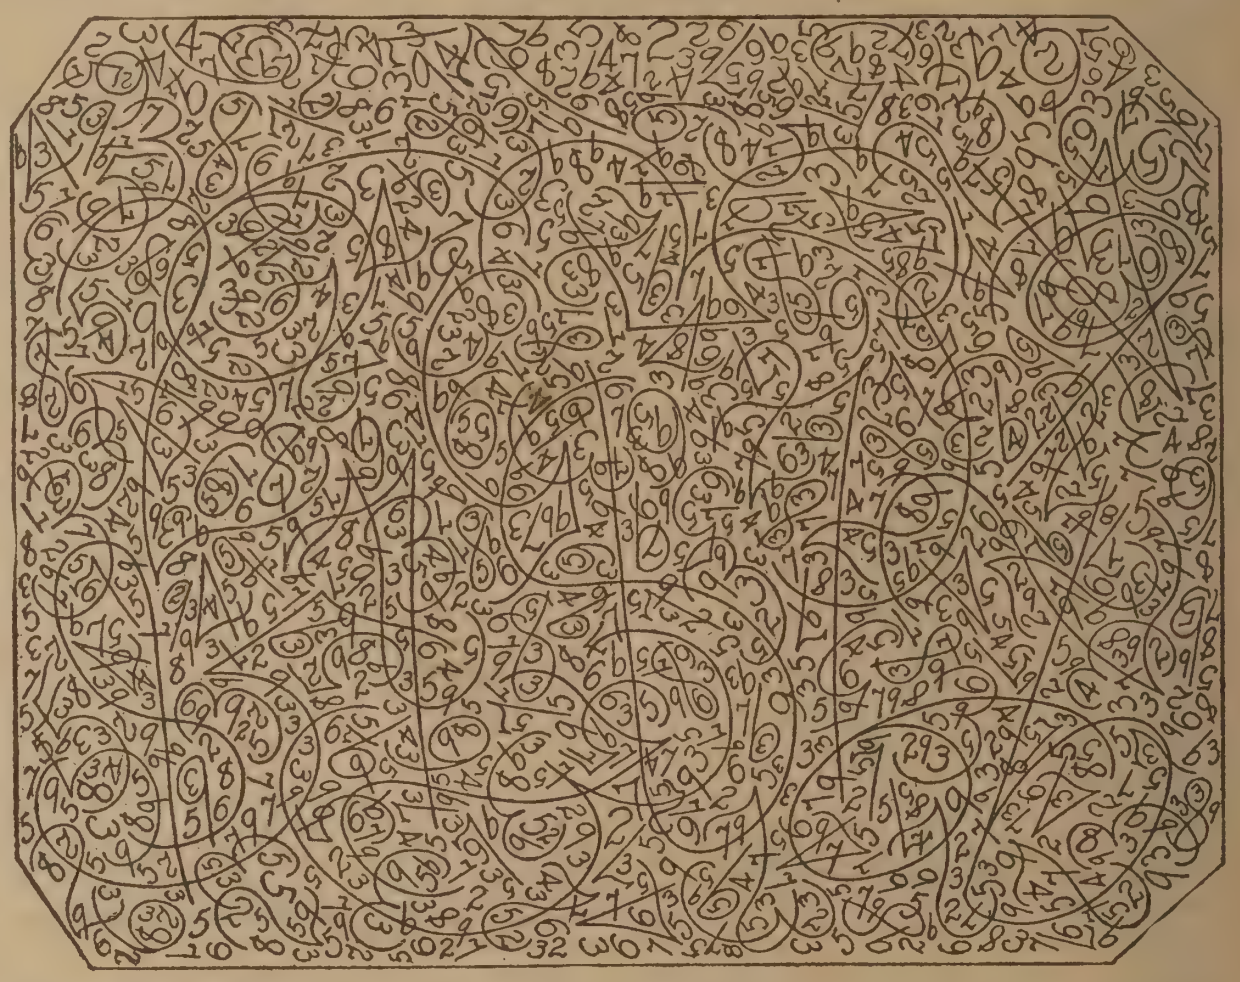
Fourth Prize, $50

to which will be added 10 times the amount paid by the subscriber with the winning solution. This prize may be worth $65.

Fifth Prize, $40

Sixth and Seventh Prizes, Each $20

Eighth to Sixteenth Prizes, Each $7



Seventeenth to Thirty-Second Prizes, Each $2

Cash Must Accompany

Solutions unaccompanied by cash payment on subscription will not be registered. Use registration blank on this page. Employes of this paper or members of their families are not eligible to enter this contest.

Don't send in your charts and working papers unless called for by the Contest Editor. Simply write your solution in blank space provided in "Registration Blank."

Remember, the contest closes March 17, 1917.

Read This!

Simply add up the figures in the puzzle chart as if they were in one long column. Your success depends on the accuracy of your total thus obtained.

Figures run from two to nine, and there are no double figures or characters which are not figures. The tail of the "6" has a decided curve, while the tail of the "9" is straight. All other fiugres have the usual characteristics, allowing no question as to the identity of any figure.

In event that no one submits the correct total, prizes will be awarded for the next nearest solutions.

This contest is restricted to persons residing in Washington, Idaho, Oregon and Montana.

A payment of $1 to $1.50 on subscription to the Farmer entitles the subscriber to enter the contest.

The money paid will be credited on subscription to the Farmer. The advantage of paying $2.50 instead of $1 is that the winner of any of the first four prizes receives additional prize dividends apportioned on the amount paid in on subscription, besides the fact that $1.50 during this contest pays for a three-year subscription to the paper, while $1 pays for only one year.

More than one solution may be submitted by any contestant, by an additional subscription payment of not less than $1 nor more than $1.50. It is not necessary to pay the same amount with each solution if more than one is submitted.

As many prizes will be reserved as there are people tied before any prizes are awarded to those sending in less correct solutions.

You can send in a subscription for some one other than yourself and have the solution registered in your own name. Remember that by paying $1.50 instead of $1 on subscription, the larger will be your dividends if you win one of the four leading prizes; but not more than $1.50 will be received with one solution.

REGISTRATION BLANK

Cut out this blank closely around the border and send it in with your solution and money.

Two Million Dollar Deal On at Olympia

Extravagant Bills Would Spend Million on Militia and Double Higher Education Cost

With few exceptions farmers are more than willing to bear their fair share of taxes when taxation is for necessary and beneficial objects. But the farmer does object to an increase of taxes for unnecessary things.

Two bills now before the Washington legislature propose a very large and unnecessary increase in taxes—the military code and the bill nearly to double at a single stroke the sums now going into the state's institutions of higher learning—the University of Seattle, the state college at Pullman, and the normal schools at Bellingham, Ellensburg and Cheney.

Wildly Extravagant.

The militia bill is probably the wildest measure now before the legislature. At the last session a tax of two-tenths of a mill was levied for the national guard and returned about $200,000. It was a very liberal provision for the guard. Kansas, for example, with half million more population than Washington, expended on its guard in 1914 $72,000; Texas, with three and a half times our population, only $37,500; Indiana, with two and a half times as many people, expended $85,000.

But the military bill at Olympia proposes to increase the guard millage to a full mill and thereby raise nearly a million dollars for that purpose.

> If the militia bill is passed the taxpayers of Washington will have to pay more for the state militia than 25 states combined paid in 1914.

If we should put $1,000,000 into our national guard next year it would be more than 25 states spent in the aggregate on their guards in 1914. That fact is of official record in the files of the war department at Washington.

General A. L. Mills, U. S. A., chief of the division of militia affairs, when before the house committee last January, submitted a table showing the annual state appropriation for the support of the organized militia, as reported by the state adjutant generals in returns of December 31, 1914. The aggregate of 25 states was $934,940, and this list includes such populous states as Indiana, Kansas, Kentucky, Minnesota, Missouri, Nebraska, Tennessee, Texas and Virginia. It is as follows:

Alabama	$ 25,000
Colorado	30,000
Deleware	17,300
Florida	47,000
Georgia	25,000
Idaho	25,000
Indiana	85,000
Kansas	72,000
Kentucky	20,000
Louisiana	25,000
Maine	55,000
Minnesota	102,000
Mississippi	10,000
Missouri	66,000
Montana	1,500
Nebraska	38,840
New Mexico	14,900
North Dakota	30,000
Oklahoma	33,000
South Carolina	15,000
South Dakota	18,200
Tennessee	20,000
Texas	37,500
Virginia	78,000
Wyoming	20,700
Total	$934,940

Federal System Planned.

At the outside Washington should go no further this year than to "mark time" with its national guard. Evidence is convincing that the guard is disintegrating as a result of lessons learned in the recent mobilization on the Mexican border. The whole complicated and difficult problem is now before congress, with overwhelming and urgent advice from the country's military experts to abandon the state militia system and organize in its place a federalized citizen soldiery.

> The educational survey measure, if passed, will add at least $800,000 to the taxes that will have to be paid by the people of the state for colleges and normal schools.

The scheme to increase the revenues of the university, the state college and the normal schools 85 per cent over what they are now receiving is brought forward in what is called an "educational survey" of the public school system of Washington. This "survey" was made hastily last year by two "experts" brought out from the east. Their report is filled with admitted errors, and it is conceded that the time taken for the work was insufficient for the making of a balanced and intelligent report.

Increase Is Unwise.

A little thought should convince sensible people that a sudden increase of this extent could not lead to wise spending of the public funds. There would, indeed, be danger that the institutions would be injured more than they could be benefited. Washington has been very liberal with its institutions of higher learning, and they should be given future growth in keeping with the growth of population and taxable wealth. But every one knows that the influx of population has been light since 1910, and that property in general sells for less today than it would bring six or seven years ago.

There is grave danger that unless a sharp protest is heard from the people the forgoing plans will be carried out in whole or in part; that this state will plunge into a reckless expenditure of public funds on the national guard and an unwise doubling of its expenditures for higher learning.

These increases could only be made at the expense of the taxpayers. If made, the farmers of Washington will find that they will have to go down deeper into their pockets when they pay their taxes next year.

Should File Protest.

You can not do your family, your neighbors and your state better service than by writing immediately to your state senator and representatives at Oympia urging them to oppose with all their power any increased outlay at this time on the national guard, and to consent only to such appropriations for the colleges and normal schools as are necessary for their reasonable support.

> In order to defeat this combined deal, an emphatic protest should be made to the senators and representatives at Olympia. For the aid of those who may wish to file such protest, a list of the legislators, by counties, is given herewith.

Adams—Senator, Oliver T. Cornwell; representative, W. M. Anthony.

Asotin—Senator, E. V. Kuykendall; representative, E. E. Halsey.

Benton—Senator, D. V. Mortland; representative, G. C. Moores.

Chelan—Senator, John H. Ferryman; representative, S. O. Pool.

Clallam—Senator, A. A. Smith; representative, A. J. Cosser.

Clarke—Senator, Edward L. French; representatives, George McCoy, C. W. Ryan.

Columbia — Senator, Frank G. Barnes; representative, Dr. L. M. Sims.

Douglas—Senator, J. W. Faulkner; representative, James A. Cross.

Ferry—Senator, J. W. Faulkner; representative, A. L. Bradley.

Franklin—Senator, Oliver T. Cornwell; representative, L. L. Long.

Garfield—Senator, E. V. Kukendall; representative, J. T. Ledgerwood.

Grant—Senator, J. W. Faulkner; representative, John Urquhart.

Grays Harbor—Senator, E. E. Boner; representatives, A. E. Graham, G. W. Gauntlett, C. W. Hodgdon.

Island—Senator, A. A. Smith; representative, W. E. Terry.

Jefferson—Senator, A. A. Smith; representatives, William Bishop, H. B. Gardner.

King—Senators, Howard D. Taylor, Ralph D. Nichols, Dan Landon, William Wray, Dr. J. A. Ghent, Lincoln Davis, G. E. Steiner, E. B. Palmer; representatives, Fred Mess, W. J. Lunn, F. C. Nelson, Paul Houser, A. E. Fuller, Dr. W. T. Christensen, Frank E. Boyle, Victor Zednick, Ralph Knapp, Frank Manogue, Robert Dwyer, Robert Grass, Frank Renick, Fred Hastings, Stephen A. Hull, John R. Wilson, E. H. Guie.

Kitsap—Senator, Peter Iverson; representative, J. H. Shattuck.

Kittitas—Senator, John H. Ferryman; representatives, J. C. Hubbell, Dr. D. Kearby.

Lewis—Senator, A. C. Judd; representatives, J. S. Siler, H. H. Swofford, J. E. Lease.

Lincoln—Senator, Charles E. Myers; representatives, E. L. Farnsworth, J. J. Cameron.

Mason—Senator, Peter Iverson; representative, Mark E. Reed.

Okanogan—Senator, J. W. Faulkner; representative, E. F. Banker.

Pacific—Senator, John W. Kleeb; representative, Fred Hart.

Pend Oreille—Senator, C. R. McMillan; representative, H. H. Murray.

Pierce—Senators, William Karshner, Ralph Mitchell, Walter S. Davis, Wilburn Fairchild, Jesse S. Jones; representatives, E. E. Healey, Abe Morris, Guy E. Kelly, T. Peterson, J. H. Davis, W. C. Elliott, H. E. Washburn, G. W. Thompson, Dr. W. P. Groff, Claude A. Young.

San Juan—Senator, A. A. Smith; representative, N. A. Nash.

Skagit—Senator W. W. Wells; representatives, J. O. Rudené, J. M. Shields, Fred B. Fulton.

Skamania—Senator, J. M. Stevenson; representative, E. E. Shields.

Snohomish—Senators, Joseph H. Smith, James Burton; representatives, Thomas A. Swale, S. F. Spencer, M. G. Thomie, C. W. Gorham.

Spokane—Senators, H. H. Phipps, R. A. Hutchinson, E. Ben Johnson, Guy B. Groff, Frank A. Chase; representatives, I. Honefenger, L. L. Westfall, Albert A. Kelly, D. P. Reid, O. L. Olsen, A. R. Stratton, Maurice Smith, L. Frank Boyd, Fred A. Adams, John Anderson.

Stevens—Senator, C. F. McMillan; representatives, Z. E. Hayden, John Selmer.

Thurston—Senator, P. H. Carlyon; representatives, L. J. Morrison, C. C. Aspinwall.

Wahkiakum—Senator, John W. Kleeb; representative, Joe Girard.

Walla Walla—Senators, Oliver T. Cornwell, D. H. Cox; representatives, A. L. Roy, Dr. J. W. Summers, Dr. R. W. Butler.

Whatcom—Senators, Edward Brown, E. J. Cleary; representatives, Tom Brown, C. H. Hoff, Charles L. Roth, Fred Yale.

Whitman—Senators, Oliver Hall, Dr. W. W. Brand; representatives, C. E. Hoover, Roy Jones, C. W. McCall.

Yakima—Senator, D. V. Morthland; representatives, W. P. Sawyer, Mrs. Ina P. Williams.

WINTER BLUESTEM

Walla Walla County Experiments.

In Walla Walla county County Agent O. V. Patton has made much headway in the introduction of "winter bluestem" wheat, a state college hybrid. The average of the trials Mr. Patton has made with this variety in comparison with the varieties commonly grown shown winter bluestem to be equal in quality and about 4.5 bushels per acre superior in yield with the other wheats. Most of the wheat farms in Walla Walla county average 700 acres.

LIME FOR FARMERS

County Agent F. W. Rader Is Busy.

Efforts to secure lime for the farmers at low prices have been engaging the time of County Agent Rader of King county. Concerning the lime, he says:

"As a result of this work we now are able to have ground limestone laid down at any delivery point in King county, at $4 per ton in bulk; $5 per ton in nonreturnable sacks; or $6 a ton in returnable sacks, with $2 rebate on the return of the sacks. This is a reduction of $3.25 to $4.75 per ton over the best prices available in October, 1914, when the county agent began work.

PACKING APPLES

At a Cost of 14 1-2 Cents a Box.

Satisfaction is expressed among the fruit growers at Entiat, Wash., who belong to the Entiat Growers' league, and enjoy the benefits of the big central packing plant operated here for the first time last season. The cost of handling the fruit, from the time it was received at the doors until the packed boxes were stacked up in the storage rooms was just 14 1-2 cents a box. This cost includes receiving, floor work, sorting, packing, paper, nailing, overhead charges and miscellaneous. Receiving of fruit by weight was tried and the results have been satisfactory.

IRRIGATION OF PRAIRIE

Declared Feasible in Lewis County.

The proposed irrigation of Ford's and Waunch's prairies in Lewis county, Wash., by a system of ditches leading from the Skookumchuck river was pronounced feasible last week by Richard Rea, a consulting engineer of Portland, who was connected with the Ellensburg irrigation project and a similar project in Oregon. He advocated the including of the Grand Mound prarie in the proposed irrigation district, however, asserting that there is sufficient water available for all three prairies.

Harmony in Legislature?

Legislators and Governor More Peaceable

Notwithstanding that the Washington state legislature is largely republican, that Governor Lister is democratic, and that many of the things that one favors is disapproved by the other, there appears to be a greater tendency on the part of both to work in harmony this session than has been the case heretofore.

This is illustrated perhaps best by the action of the leaders in the lower house, who have agreed to have bills prepared in accordance with all the recommendations made by Governor Lister in his message to the legislature, and to have them come before the legislature strictly on their merits. This does not mean that all such recommendations are to receive the approval of the legislature, but that they will not be disregarded or smothered in committees as has been often the case in the past.

Constitutional Convention.

The most vital action of the legislature so far this session is the passing of a resolution by which the voters of the state will vote in 1918 on whether or not a constitutional convention will be called to revise the constitution. The passage of certain measures to carry out the provisions of the resolution will be necessary, but it is believed certain that they will be passed.

Dry Law Moves Slowly.

There seems no hurry on the part of the legislature in deciding on the "bone dry" law. The bill has been introduced, but no action taken yet. One of the dominant questions in this connection is whether the measure shall be passed outright or passed with a clause referring it to the people in 1918 for approval or disapproval. Many oppose the measure unless the people are allowed to vote on it, saying that the prohibition law now on the books should not be changed except by popular vote.

Rural Credits Bill.

Senator Iverson of Kitsap county has introduced into the senate a measure in the nature of a rural credit law. He proposed that the state issue bonds to be sold to provide a fund from which loans may be made to the farmers. Such bonds could not exceed in total amount 2 per cent of the last assessed valuation of all property in the state, which would at this time create a maximum fund of $20,000,000. A farmer could borrow from this fund an amount not to exceed one-half the valuation of his property as determined by a state board of appraisers, such loans to bear 5 per cent interest. Such loans could be expended by the farmer only in paying for his land, buying live stock or equipment or otherwise actually developing his farm.

This measure, which is in the form of a constitutional amendment, has received no action at the hands of the legislature and likely will not be definitely considered until late in the session.

School Controversy.

The controversy between the state college at Pullman and the university at Seattle over the transfer of courses from the former to the latter as recommended by the educational survey board appointed by the last legislature continues to be one of the tinder boxes of the session. Feeling is reported to be growing heated between the friends of the two institutions, and many hearings on the questions involved are being held. One of the features of the educational measures in question is an increase of the taxes for higher education from about $1,000,000 to nearly twice that amount.

ON SUMMER FALLOW

Peas Can Be Grown Profitably.

In Grant county County Agent H. W. Reaugh is giving a large proportion of his time to demonstrations of good summer fallow methods and the growing of crops adapted to dry conditions. He has succeeded in demonstrating that peas can be grown profitably in many districts as a substitute for summerfallow. In quite dry districts, some progress has been made with sweet clover. Among the insect pests of the country, the "coulee cricket" is one of the worst, and much of the county agent's time has been used in devising methods of controlling this insect. Ditching, fencing, grazing hogs and other means have been used to advantage. A beginning in the cooperative marketing of live stock has been made. Several carlots of live stock of 20,000 pounds each were shipped recently, the average increase in profit due to this means being about 50 cents a hundred.

Did you read the first instalment of "When Knighthood Was in Flower?" It appeared in last week's Farmer. The second appears in this issue. This story is too good for you to let go by. It is one of the world's masterpieces of fiction—a perfect story of those two fundamentals, love and adventure. The Farmer "throws it in" for good measure with all its regular news and informative features. If you did not read the first instalment, go back now and begin it before it is too late.

Yakima Birds

Score Higher Than In the Past

By D. G. SUTHERLAND.

About a month ago, at a called meeting of the Yakima Poultry association, it was decided that on account of so many quitting and others greatly decreasing the size of their flocks on account of the high price of feed and boycott on eggs, it was best not to hold their annual show this year.

A week later 18 of the breeders got together and decided a show was necessary if they remained in the business. The former action was reconsidered, the date fixed as January 15-20, inclusive, and everybody got busy. The result was 36 exhibitors with 401 birds, representing 28 different varieties. All the available floor space was filled. Harry H. Collier acted as judge.

Birds Score Well.

The average score of all birds was fully 25 per cent above that of former years. It shows the "boarder" bird is being eliminated the same as the boarder cow. The breeds leading in number were Rhode Islands, 56; Leghorns, 55; Plymouth Rocks, 42; Orpingtons, 35; Wyandottes and Minorcas, 23 each. Other breeds were fairly well represented. There was a goodly display of turkeys, ducks and geese. The song service was conducted by Mrs. White's canary choir. A pen of silver pheasants, exhibited by C. A. Marsh, was quite attractive.

The highest scores were made by Harold Paddock on a S. C. White Leghorn pullet and by J. A. Adams on a S. C. Black Minorca pullet, each scoring 94 1-2. Next came R. D. Walker with a S. C. White Leghorn pullet and Mrs. Fred Peterson with a White Rock cockerel, each making a score of 94. R. D. Walker and J. A. Adams on S. C. White Leghorn pullets and J. P. Thurston on a Buff Leghorn pullet, each making a score of 93 3-4.

USING AUTO TRUCK

More and More for Short Hauls.

By Edward Louis Sachtler.

Another late example of how the automobile truck is fast displacing the railroad and other means of transporting freight on short hauls was demonstrated here some time ago. The truck, owned by Olsen & Littler, liverymen at Ridgefield, was loaded at 10 a. m. with 21 porkers, one of which weighed 650 pounds. The trip was made to market, the Union Meat company's stockyards across the Columbia river from Vancouver, Wash., the hogs delivered and the truck returned to Ridgefield, reaching there about 4 p. m. the same day. The stockyards are located about 20 miles southeast of here. The porkers were taken from the Greely ranch, four miles east of Ridgefield and netted the raiser about $525.

Market Situation

In Meat Industry to Be Probed

The American National Live Stock association and the meat packers and market men have entered into a far-reaching agreement under which the meat and live stock market of the country will experience a government investigation within the near future. This was announced at the association's convention last week at Cheyenne, Wyo.

The meat packers were largely criticized by the stockmen and visiting men of note attending the convention. The association declared its purpose to be to insure for the future "fair and competitive markets," and declarations were made drastically in some instances that the packing concerns had been in control of the market situation and had dealt unfairly with the producers.

Incapacity Charged.

"The most amazing situations to the civilized world is the utter ignorance of the heads by inheritance of five of the nation's greatest packing concerns of the economic principles underlying the industries they direct" said Walter L. Fisher, former secretary of interior, commenting on the report of the market committee.

He added that these concerns were paying out thousands of dollars annually in advertising designed to convince the public that their methods were fair and equitable.

Secretary Houston Present.

Secretary David F. Houston of the U. S. department of agriculture was present attending the meeting, and declared that he saw no occasion for an honest concern to be afraid of the American people.

Next Meeting Place.

Salt Lake City, Utah, was decided upon for the convention next winter. The following officers were elected:

Isaac T. Pryor, San Antonio, president; vice presidents, John B. Kendrick, Sheridan, Wo.; C. M. O'Donnell, Bell Ranch, N. M.; M. K. Parson, Salt Lake City; Wallis Huidekoper, Walls, Mont.; Isaac Baer, Meeker, Col.; W. J. Tod, Maple Hill, Kan.; E. L. Burke, Omaha, John W. Springer, Denver, was elected treasurer and T. W. Tomlinson, Denver, secretary.

Wool Growers

Hold Convention at Salt Lake City

(Continued from page one.)

The resolutions declare for the standardizing of wool and ask the United States department of agriculture, if possible, to creat a standard.

On account of rabies as well as the direct losses an appropriation of $300,000 is asked of congress for the use of the biological survey in ridding the country of predatory animals, and legislatures of western states are also asked to make liberal appropriations; urge the United States bureau of animal industry to conduct experiments to determine the best methods of winter feeding of range sheep; condemn the action of the agricultural committee of the lower house of congress in cutting out an appropriation of $20,000 for an experimental sheep-feeding farm and ask the senate committee to restore the item; to recommend aid to the National Live Stock Shippers' league by the collection by commission agents of 5 cents for each car of sheep sold, the funds to be used toward presenting a case to the interstate commerce commission regarding rates for live stock, including the concentration paint question, and the commission is asked to restore the ten-car rate between ranges; urgently appeal all sheepmen to have wool graded at the shearing sheds; extends thanks to the National Wool Warehouse for its campaign of education; heartily pledge the secretary of the interior our cooperation in laying out trails and maintaining them; again go on record for a fair tariff, which will be needed when the war is over, to be determined by a nonpartizan tariff commission; indorse the United States department of agricultuture and thank Secretary Houston for his fair treatment of the wool industry.

State College Gives Industrial Education

Secretary Redfield, of the Cabinet, Says U. S. Must Have More of That Training After the War

Secretary Redfield of the United States department of commerce warns the American people that unless they provide industrial education the United States will find itself outstripped in the contest for home and world markets after the European war. Addressing the Philadelphia Chamber of Commerce this member of President Wilson's cabinet said:

"We usually ignore science in industry, and are apt to talk about a practical man as better than a scientific one. Meanwhile Germany builds up great industries, wholly based on scientific research, and England organizes a special government committee on industrial research. Industry must be wedded to science in this country if it is to compete with nations where science and industry go hand in hand.

"We have almost wholly lacked industrial education. It is not so in Germany. Make no mistake; it is not the wages of the German workman that make it hard to compete with him. It is his training.

"We are making a beginning in federal aid to industrial education. Sometimes I think we have a gift of ignoring the important and neglecting the obvious."

In Washington federal aid to industrial education is given through the state college at Pullman. That institution is working along the lines that Secretary Redfield says are essential to American progress in industry and commerce.

Men who would tear down the state college to build higher the state university at Seattle are out of touch with modern science, world progress and advanced thought. They know not what they do.

Dairy Business Not Philanthropy

Will Cows Producing 180 Pounds Pay? Idaho Man Can Not Believe It

Our dairy survey has started much interesting and instructive discussion, and in the following letter H. R. Boomer offers valuable thoughts regarding the relative merits of the scrub cow that grazes on the highways and picks up a precarious subsistence, and the highbred dairy cow that is fed and sheltered in a modern dairy.

CALDWELL, Idaho, Jan. 4.—Editor of the Farmer: My attention has been attracted by a letter from Mr. Ainy printed in your January 4 issue. Like Mr. Ainy, I have never posed as a correspondent, and have never written anything for publication unless requested to do so. If Mr. Ainy had not referred to me in somewhat flattering terms and later advised me to turn over my 300-pound cows to the 180-pound man I would allow the letter to go without comment.

In the first place I am sorry he did not go on and explain how he would make the 180-pound cow pay a profit In the first place the man who keeps two or three cows as a side line, letting them feed in the "highways and byways" or in short on other people's grass, can hardly be said to be in the dairy business, so we can leave him out of the argument.

I take it the dairy business is being discussed from a business standpoint and not as a philanthropy. Therefore, I do not see why anybody should keep his unprofitable producers for fear the product would go higher and cost the consumer more. It seems to me if production would be lowered 75 per cent by disposing of the cows under 300 pounds, there would surely be a profit for the cows still remaining. If Mr. Ainy was in the business 45 years I hardly think he was there for the purpose of reducing prices to the consumer by keeping all the poor cows he could. It seems as if this paragraph in his letter has no bearing on the question of the profitableness of the dairy business to those so employed.

Would Not Pay.

Taking the 20-cow dairy, which he mentions with a production of 180 pounds per head, the total would be 3600 pounds. He seems to think the labor of caring for this dairy should be worth more than $730, in which I agree with him. At any rate I am convinced it could earn more at something else; but this 3600 pounds at something over the average price since I have been in Idaho would bring about $1000 gross. The difference between this and the too low value of the labor is only $270. I don't think any dairyman would have to think long to know that other expenses besides labor are way above this sum. The cows have not been fed yet, nor has interest on the investment in cattle and land been paid. Taxes also amount to something and can not very well be dodged, and there is cost of machinery depreciation and interest on cost of machinery. In fact the $270 hardly makes a start toward paying the other expenses besides the labor, and how any business profit can be found in such a bunch of cows I am unable to figure out.

I will have no argument with Mr. Ainy about my management of my own herd. It may be overmanagement, but I am inclined to think it undermanagement. At any rate I can see many mistakes and much room for improvement in the management. I have not reached the point, however, where I will take the 180-pound cow in preference to the 300-pound cow if I can have my choice, and I would prefer the 500-pound cow.

During the past year the poorest producer in my herd has been a 2-year-old with a production of just about 250 pounds of fat, which is considerably above the average of the 20-cow dairy advocated, and the 2-year-olds in such a herd probably would not come up to the 180-pound average. I can not blame the good quality of my cows for the meagre profits. On the contrary it seems to me that the owner of the 180-pound bunch is in a considerably worse position than myself, and I have been observing a good many of them. Unless I am bliad they work unreasonable hours, and work their whole families, live very economically, make no real profit on management, and no interest on their investment. They merely earn low wages for themselves and family, and if they have a mortgage to pay interest on, or rent to pay, have to take these items out of their wages. They don't seem to be wedded to the 180-pound cow from choice, but would be glad to buy some 300-pounds cows if they could scare up the money to do it with. They keep on with the scrubs hoping somehow some day to get enough ahead to buy something better. Many have bettered their heards the past few years through the purchase of purebred sires, which is a slow process, but the only way to do it where capital is short, and many a farmer could have built up a good herd this way while waiting to make a profit out of the 180-pound cows. In short, it seems to me the figures above prove conclusively that the latter can't be done. That Mr. Ainy could show me where my management is faulty I haven't the slightest doubt, but the profit on the 180-pound cows is another story. I shall have to be shown.

Your respectfully,
H. R. Boomer.

Land Classification.

Since the passage in 1912 of the act providing funds for land classification, and as a direct result of the classification work, a total of 13,477,781 acres has been eliminated from the national forests. This includes an elimination of approximately 5,800,000 acres of land from the Chugach national forest in Alaska, which embraced lands of low value for any purpose other than mining.

Silos in Argentina.

Drouth and the ravages of locusts have so reduced pasturage and the available supplies of fodder in Argentina recently that the attention of planters and stockraisers has been focused on the feeding-stuff question and the advantages of silos are being discussed with new vigor.

Loan Bank Organization

Is a Task Requiring Time to Complete

By N. W. DURHAM

Chairman Spokane Committee on Federal Loan Bank.

As this article is written the organization of the Spokane federal farm loan bank, to serve the district embracing Washington, Idaho, Oregon and Montana, is still unannounced from Washington. Some impatience is felt at the delay, but it should be remembered that the national board is charged with the large task of organizing 12 such banks to cover the entire Union. It has the selection of five directors and a registrar for each institution—a total of 65 important appointments — from a field of several hundred applicants. It is vitally important that these places be filled with wise discretion, and the board is exercising necessary caution. It can not afford to endanger the whole broad system by yielding to haste at this juncture.

In the meanwhile farmers who are considering the organization of local national farm loan associations should write to W. W. Flanagan, secretary of the federal farm loan board, Washington, D. C., for free official blanks and instructions.

A Warning Is Issued.

To the Editor of the Farmer: In your issue of January 4 we note that reference is made to certain promoters claiming to be operating under the provisions of the federal farm loan act in Twin Falls county. We wish to say that we have met these gentlemen and that the farmers here have been warned to look out for them.

As the parties referred to seem to be operating over rather extensive territory, we submit a copy of a letter from the federal farm loan board which explains itself and which we trust will interest the farmers.

S. A. DICKEY.

Mr. Dickey encloses the following letter from Secretary W. W. Flanagan of the federal farm loan board, at Washington, D. C.:

Dear Sir: Your letter of December 28 was duly received, in which you enclosed some literature issued by the Inter-Mountain Rural Credit association.

If farmers purchase stock in that concern they do so at their own risk. It is not a government institution, and in all probability will not be chartered by the federal farm loan board.

A large number of letters have reached this bureau relating to this and other similar associations.

W. W. FLANAGAN,
Secretary Farm Loan Board.

Asks Information.

HELENA, Mont., Jan. 8.—Editor Farmer: There has been a great deal of talk of the farm loan proposition, but as yet I do not know of any farmers who have organized for this purpose. Many believe the law is of no benefit to the farmer who is really in need of help, for the reason that it permits a loan of only 50 per cent of the actual land valuation. There are a number who have already put improvements on land, and have loans of half the value of land and improvements together. Such farmers would be greatly benefited if they could shift the loan to the government and pay a smaller rate of interest.

Farmers who only wish a loan which equals half the valuation of the bare land have gilt edge security and can get a good loan without government assistance.

I have a piece of land with house and buildings on. I would like to change a $4000 loan to a less rate of interest if possible. The land alone would hardly be placed at $8000 valuation. Therefore, I can not get the benefit of this law. My understanding may be incorrect, but I am unable to see where a loan can be secured under these circumstances. H. F. ALPS.

We do not know whether Mr. Alps could get the desired loan on his land, as that is a matter that could be determined only by an official appraisal. In general, though, it can be said that the law contemplates the making of loans up to 50 per cent of the "farm value" of the land, and in determining that valuation the appraiser will naturally consider the productive value of the property as it has been improved by the owner. Such improvements as cultivation and fencing would be taken into consideration. In addition the landowner can borrow a sum equal to 20 per cent of the value of such insured improvements as dwellings, barns, etc.

Logged-Off Land Loans.

One of the most difficult problems that will puzzle the managers of the Spokane farm loan bank will be the granting of credit to owners of logged-off lands in the Pacific northwest. These lands are so varied in soil quality, ranging all the way from the highest fertility to practical worthlessness; and the moral risk fluctuates so widely with the industry and intelligence of the owner, that the making of mortgage loans will call for thorough investigation and the exercise of the wisest discretion. On many of these farms loans can be safely made and their owners will be entitled to all the benefits of the new system.

The following interesting letter from a subscriber bears so directly upon this problem that the Farmer is glad to print it in entirety:

To the Editor of The Farmer: I, for one, think the farm loan act is not going to work out as well as a good many think. I base my belief on what I have seen around me and what I have experienced in a residence of 23 years on the stump lands of Clarke county, Wash.

I can show any one within a distance of two miles of my place six or seven abandoned homes—people that had settled on small tracts of land, stayed from one to four or five years, cleared or tried to clear land, built houses, some of them good ones, and then moved away.

One man, J. Bobbins, moved on to 10 acres four years ago last November. He had $400, a wife and one child. His place was covered with stumps and brush. A small cabin, 10x12, was all there was on the place. He and his wife never lost a day the whole winter. He is just finishing up the clearing of the last three acres. He still owes $400, but has live stock enough to pay it off. He has a good barn, a young orchard started, and plenty of tools, team and a stump-puller.

But where you find one Bobbins you will find 10 others that will fail under the same conditions.

Take Mr. C., another neighbor about the same distance away from my place as Bobbins. (He died this fall.) He was an intelligent man. He had been keeping a grocery in Portland before coming upon his land. He went upon 10 acres, built a house, and by the way, his land was situated in an enclosed range of over 200 acres that had been logged off, burnt and seeded, and had in it the finest of feed and running water. Well, Mr. C. tried cows, he tried hogs, he tried goats, he tried sheep, poultry and geese. The place is vacant now, and I doubt very much whether his mother can get half what they paid for it, $150 per acre. There is only a little cleared on it.

We know this, that there are so many people that know nothing about farming or caring for live stock, but think if they can only get onto a piece of land the rest is easy; but they soon find out their mistake. Their money will be gone and the thrifty, hard-working members will have to make good their losses.

I think the government will have to take the risk and not the farmer.

H. S. STOCKFORD.

Vancouver, Wash.

Mr. Stockford has analyzed one phase of the matter with evident knowledge and sound conclusion; but his expectation that the government can take the risk of making hazardous loans on doubtful farms can not be safely adopted.

Once it became known, or even was suspected, that the federal land banks were going into the market in search of doubtful mortgage loans, the system would collapse like a punctured balloon. Farmers with credit would keep out of the farm loan associations, for membership means a personal liability on their part to the extent of 10 per cent of the individual borrowings. A farmer, for example, who borrowed $5000 would be liable to the extent of $500 if bad loans in his association had to be made good.

The success of the system is further dependent on public confidence in the farm loan bonds, sale of which is to provide the needed money to keep the system growing and going. Farm loan mortgages are the security for these bonds, and investors would leave them severely alone if they thought that the management was taking on doubtful mortgage assets.

The public should take a reasonable view of these matters and not demand the impossible. It is a problem of the greatest good to the greatest number, and the greatest good can only be given by building the new system on solid foundations.

BAKER COUNTY

Applications Exceed $150,000.

Permanent organization of the Baker County Farm Loan association has been perfected at Baker Ore., with M. S. Bond, president; J. F. James, vice president, and J. W. Riggins, secretary-treasurer. By the time loans are possible under the rural credits law, the local association will be ready with applications for loans in excess of $150,000 subscribers for stock already asking over $100,000. W. W. Lovelace, F. C. Heard, Archie J. Murray, C. L. Deardorff, J. F. James, Byron Vandecar, Hugh Dougherty, W. W. Willoughby, M. S. Bond, directors of the temporary organization effected some time ago, were made a permanent board. All are substantial representative farmers of various parts of the county.

RURAL CREDITS

Farm Loan Association at Emmett.

At the meeting held at Emmett, Idaho, in the Fruit Growers' Union building, the organization of a national farm loan association, to take advantage of the rural credits act, was completed. The following gentlemen were named as a board of directors: R. A. McCool, L. Dresser, F. W. Reed, R. J. Kraus and Sid Walker. Mr. McCool was also made president of the association and E. W. Brown is acting secretary. There were 23 applications filed for loans, but the amounts were all small.

OUR GUARANTEE TO SUBSCRIBERS.

Any subscriber who does not feel that The Washington Farmer is worth to him all and more than the subscription price may order the paper discontinued and the unusued portion of the amount paid for the subscription will be refunded. You must be satisfied.

Entered as second-class matter January 13, 1916, at the postoffice at Spokane, Washington, under the act of March 3, 1879.

GUARANTEE OF ADVERTISEMENTS.

We guarantee every subscriber against loss through dishonesty or swindle by any advertiser in this publication; we do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Complaints must be sent us within 30 days from the date of the transaction, and the subscriber must have mentioned The Washington Farmer when writing the advertiser. This guarantee applies to live stock, except that we will not be responsible for claims for damages on account of disease in stock sold through these columns.

Crop Yield of Washington.

The government statistics for the state of Washington, while probably not absolutely correct, give a working basis for conclusion, and most of them are encouraging. For example, the high prices paid for wheat cut down the acreage of corn, and yet improved conditions made production of corn greater than in 1915. The wheat crop, on the other hand, although grown on more acres than in 1915, was not so large, due to unfavorable weather conditions, but the price was higher and made the crop as profitable.

The hay crop would seem an especially profitable one. The 1916 crop was larger and the price higher.

The potato crop of last year was larger than that of the previous twelvemonth, and the price was better.

Admitting the Truth.

People do not like to admit it when they are convinced of a new truth against which they have contended, but they usually do admit it by either word or deed.

Experimentation has proved conclusively the benefits to be gained by certain methods of soil treatment which were practically untried a few years ago. Many of us have clung to the old methods to our detriment rather than fall into line behind others and profit from their experiments. But, as a rule, we are getting over that. We are beginning to till our soil the way the man does who raises the best crops. We are beginning to grow fertilizer crops that we ridiculed a decade ago. We are beginning to return fertility to the land by raising live stock that a few years ago we thought we couldn't afford to be bothered with. Possibly we are forced to it, but we are admitting the truth that modern ways are better than the old.

From Range to Farm.

At a recent meeting of the Idaho Wool Growers' association one of the leading topics discussed was the range problem. Members of the association were free to admit that the problem was a serious one. The ranges are being fenced and developed into farms. The enlarged homestead acts, including that permitting the taking up of 640 acres, are reducing the open areas. The government is increasing the fees for grazing permits in the forest reserves. Said President Sproat of the association: "The next three years will determine the fate of the wool-growing industry."

The members did not say it openly—probably they do not believe it to be true—but it is not altogether illogical to draw the conclusion that the sheep must become a farm animal, not a ranger. If the ranges are being turned into farms there is no other place for him to go. This is not only fast becoming the sheep grower's one alternative, but the conditions which bring it about are placing before the small farmer the possibility of raising sheep for profit on the farm. The wool and mutton form a valuable "byproduct" of the farm where the small flock has been tried. The sheep converts weeds and waste into value, and in addition improves the land. The sheepman's dilemma is the farmer's opportunity.

State College Is the People's School

Prof. Suzzalo, the new president of the state university at Seattle, ambitious to build up that institution and make himself famous, wants to undermine the state college at Pullman. To that end hostile interests are conducting an active lobby at Olympia to deprive the state college of certain branches of study.

Friends of the state college are convinced that this scheme is but the entering wedge of a boldly designed plan to strip it down to the narrowed basis of an agricultural school. President Holland warns the people that if these plans are carried out at Olympia the Pullman institution will be reduced to a lower plane than the Oregon agricultural college at Corvallis or the Montana institution at Billings.

For a quarter of a century the state college has been serving well the agricultural, orchard, dairy, live stock and other industrial interests of all parts of Washington. The sacrifice, of course, is not necessary, but if the people of this state had to choose between the loss of one institution or the other they could far better lose the state university at Seattle.

The people will protest vigorously against these political schemes to cripple the splendid college at Pullman. The attack is an undemocratic effort to destroy the state college by setting up conditions that would place the young men and women in the Pullman institution on a lower plane than the students at Seattle.

Leave the state college alone! It is asking nothing from the state university. It only wants to continue on the firm foundations of state and national law. Its course of growth and service was plainly charted by the state law passed in 1891, and it has adhered scrupulously to that statute.

The state college is the people's college, and the people must defend it.

Beauty and Usefulness.

A cattle breeder is credited with the statement that he would rather sell beauty than butter. There is a certain amount of worldly wisdom in this attitude, for the big profits are made off things which are of no real use. However, a good many of us prefer to be of use, even though we make less, and the only difficulty is that sometimes the useful things do not pay any profit at all.

What Is This Time For?

The wise man said there is a time for singing and a time for weeping, and so on, including all that he could think of at the moment. In other words, he saw the importance and desirability of having a certain time to do things, and also that there were seasons when a certain thing might be appropriate and advisable and proper, when another time might not be suited for it.

What is this particular season and time best adapted for? Winter is quieter than other seasons on the general farm. There are no fields to plow or sow or cultivate, no crops to harvest. This period of slackness, if one can call it that, should be studied very carefully for employments so that we may be saved many moments and hours and days of time when other work presses.

Clearing Land.

There is much land in the northwest which is still uncleared. Some of it would produce excellent crops under cultivation. The owners, many of them farmers, do not hasten to its redemption, and once in a while somebody works up quite a little indignation over the fact that there is waste land.

It takes either a tremendous amount of labor or quite a bit of capital to clear land. Some of it is not worth what the clearing costs, figured as land values are now. By what right does anybody demand of farmers the clearing of land at a loss of years of life or hundreds of dollars?

We admit that more food products should be raised, but we insist that they will not be raised until the public generally realizes the fact that farming must be better rewarded, and goes to work to arrange for the reward.

Machinery, wagons and the like are damaged almost as much, if not quite as much, during their winter idleness as during their spring, summer and fall use unless they are kept in out of the rain and snow.

Washington Gleanings

Potatoes in Tacoma have been selling as high as $45 a ton, and dealers predict a yet higher figure.

There are 120 men and women attending the winter short course at the state college at Pullman.

The city of Aberdeen, on Grays Harbor, reports only 116 deaths during the past year, with 256 births.

Frogs are reported to be croaking in the pools of Clarke county, and prophets are predicting an early spring.

A number of real estate transactions are reported from the Cashmere country in which the price has been around $1000 an acre.

The Cowlitz Valley Development club has been formed at Chehalis for the purpose of furthering the development of the district.

The hop lands of the Yakima valley and in other parts of the state where hops have been grown are declared to be ideally fitted for growing sugar beets.

It is reported that Ervin Wickersham of Harwood, in Yakima county, has sold his onion crop at prices ranging from $50 to $75 a ton. He produced at the rate of 20 tons to the acre.

In the biggest coyote drive ever organized in central eastern Washington a large number of residents of the territory around Quincy killed more than 100 of the animals recently.

The Grays Harbor district is greatly pleased by the report that a railroad is to be constructed from Port Angeles to Aberdeen through the Olympic peninsula, thus opening up to markets the great timber and dairying possibilities of an immense undeveloped territory.

The federal government has denied a request that a survey of the Snake river from Asotin to its mouth be made with a view to dredging it to make it more readily navigable. The report of the government is that such dredging would be more expensive than the benefit would justify.

Arrangements have been made by the county commissioners of Franklin county for the building of an arterial highway through the town of Pasco, a portion of the state highway law permitting joint improvement of a highway within a town limits by the county and the town authorities.

Lumber mills in the Grays Harbor district have shipped 28,000 carloads of lumber during the past year, or 7000 more cars than in any other year in the history of the industry. This is specially significant in view of the fact that the lumbermen of western Washington largely closed their mills three years ago owing to lack of market, together with foreign competition. The 1916 business totaled approximately 800,000,000 feet.

What Others Say.

Inland Farmer: Every acre must be farmed enough, but not too much.

Southern Agriculturist: Try your own advice before you pass it on to others.

Hoard's Dairyman: The moment we enter upon a new way of doing things new problems arise.

Better Farming: An extravagant man is always talking to his wife about the necessity of economy.

Western Farm Life: The time has come for farmers to assume collective responsibility for the success of their communities.

Municipal Markets

Must Serve Special Need in Community

Charles J. Brand, chief of the United States office of markets ad rural organizations, discusses with keen insight the pros and cons of public markets. Now that this subject is a live one before the people of Washington, Oregon, Idaho and Montana, Mr. Brand's conclusions will be read with interest. Herewith is a discussion by Mr. Brand:

In order to correct any misconception on the part of those who may read this brief discussion, it is desired to state at the outset that, although the office of markets and rural organization has devoted considerable time to the study of the various types of municipally owned retail public markets, it is not advocating them in an unrestrained way to all cities, nor is it intimating that they are a panacea for the present weaknesses of our retail system. If a public market does not fill a specific need of the community, and if it does not render some definite service better than existing private agencies, then it would seem that a city is not justified in establishing or continuing such an institution.

There are, we believe, certain fundamental deficiencies in our system of retailing which in many cases a well-conducted muncipal public market can help correct. Conditions seem to warrant the general opinion that the customer who is willing to pay cash and possibly carry his goods home is given too scant consideration by the average retail dealer. That such a customer, in the prices he pays, should be made to contribute to cost of service for others seems both uneconomic and unfair. To some extent the cash chain store is remedying this condition, but in most cities such developments have been meager. Also, this type of store, in many instances, does not deal in perishable fruits, vegetables and fresh meats.

All considerations point to the fact that these products especially should be handled with great rapidity and that their distribution should be wide. It is quite evident that low prices, narrow margins of profit, a large volume of trade served at a low cost to the dealer, and specialized selling, all aid in attaining the ideal desired.

It is to furnish a trading center the primary object of which is to sell food products and not service, and to provide facilities and conditions which will allow and encourage dealers to operate under the above methods, that the office of markets and rural organization is suggesting modern city markets when the local situation seems to make such action advisable.

The comparatively small size and the limited trade of the average corner grocery and meat market necessarily restricts the quantity and assortment of perishable products which it can handle. Unless skilled hands are in charge, the meats and green groceries are very apt to be a source of much trouble and no little loss.

The successful public market furnishes a fresh, attractive and generous assortment of products from which the consumer likes to select. The large volume of trade which a good public market draws enables the live stall keeper to make quick turnovers with a minimum of waste and expense. The small size of the stall encourages specialization and proficiency in selling. These factors, together with low rentals, the absence of credit accounts, and a minimum of delivery expense, should combine in any municipal market worthy of the name to bring about lower retail prices.

In addition to the advantages which accrue to the consumer, such a policy should result in profits to the dealer which are as good or better than he receives under the credit-delivery system, and his business should be far more satisfactory in general. In many cities the majority of stalls in the municipal market are branches of established private stores, but they are conducted on the cash, and, in some cases, on the no-delivery, principle. Thus they are made to cater to that portion of the public who desire to save money on their food purchases, and who, in order to do so, are glad to go to market personally, select and inspect their purchases, pay cash, and either carry their goods home or pay for their delivery.

It is fully realized that comparatively few municipal markets are conducted in all respects according to this plan. It is true that many are insanitary, unattractive, poorly managed and of doubtful value to the consumer. The office of markets and rural organization is endeavoring to bring cities to a better realization of the definite service which a municipal market should afford. They must be disabused of the idea that a municipal market will benefit a city because it eliminates the middleman, and be made to understand the true functions which such an institution should perform. It seems evident that these markets will not displace the established trade, but rather supplement the service which is now given.

APPLES IN STORAGE

Decrease of Nearly 30 Per Cent.

Reports from 469 storages show that ther rooms contain 2,386,975 barrels and 3,807,857 boxes of apples. Holdings reported from 364 storages showed 2,204,-833 barrels and 3,542,322 boxes on January 1 as compared with 3,743,055 barrels and 3,209,503 boxes on the same date a year ago, a decrease of 29.7 per cent. The barreled apple holdings show a decrease of 41.1 per cent and the boxed apples an increase of 10.4 per cent as compared with those of last year. Our report of January 1 last year showed the amount stored to be 9.8 per cent greater than on January 1, 1915. The holdings have decreased 10.4 per cent since December 1 as compared with a decrease of 12.0 per cent during December, 1915, and 14.0 per cent during December, 1914.

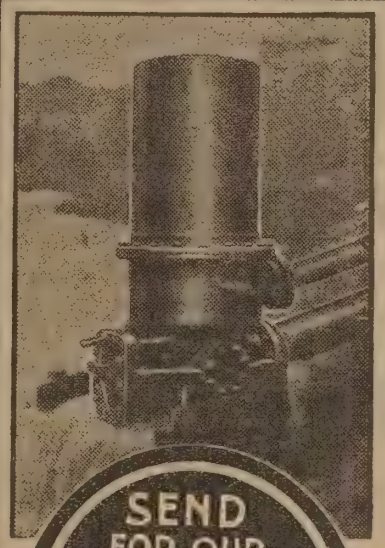
ROADS AND TRIALS.

Pacific Northwest Allottment.

Secretary Houston has announced the amount allotted to each state from the million dollars to be spent during the fiscal year 1918 in constructing roads and trails within or partly within the national forests. This money is part of the $10,000,000 appropriated by the federal aid road act to assist development of the national forests, which becomes available at the rate of a million dollars a year for 10 years.

The amounts allotted to the four states of the Pacific northwest are as follows: Washington, $91,944; Oregon, $128,111; Idaho, $103,730, and Montana, $70,042.

Gets Trap Score.



A black Orpington cockerel, owned by Mrs. H. H. Marshall of Walla Walla, has scored highest in the Walla Walla Poultry show so far. Judge H. H. Collier of Tacoma stated that if is the finest cockerel that he has seen in 10 years.

Grain Bags

Can Be Made From Palm Fiber

C. P. Stewart, speaking before the farmers' union at Walla Walla, Wash., recommended the use of the fiber of the banana palm, thousands of tons of which are wasted annually, as a substitute for jute in making grain bags. Bags from banana fiber would be three times as strong and last four times as long as jute bags, he said. Jute fiber is not as strong as it was 10 years ago and each year the crop is getting poorer, the reason being that natives of India are raising more than they can properly care for, the speaker said. Enough banana fiber is wasted in a day to make grain bags for Walla Walla for one year. Jute is raised in one country and bananas in 12. He predicted farmers will not be able to buy all the jute bags they need this year.

Warden Henry Drum of the Washington States prison recommended that Washington and California cooperate in experiments with the banana fiber. Small quantities of the banana palm fiber experimented with at the prison have been satisfactory. Sacks would be manufactured more cheaply with banana fiber than with jute.

SEND FOR OUR FREE BOOKLETS THEY WILL TELL YOU HOW

MORE DOLLARS PER ACRE WITH A HILL HYDRAULIC RAM

The Hill Hydraulic Ram is the latest achievement in low-cost, individual irrigation systems. It eliminates crop-failure from drouth, will reclaim your waste unwatered land, provide a modern watering system for your home, your barn and all your outhouses. The Hill Ram will simplify your farm labor problems and bring more dollars per acre to your purse than any other piece of farm machinery of recent years.

From 20 to 40% More Efficiency WITH A Hill Ram

Under a given head of water pressure we guarantee that the Hill Hydraulic Ram will deliver from twenty to forty per cent more water than any other ram manufactured regardless of the price. The ultimate cost of a Hill Ram is less than any other ram on the market today. There are other rams that will cost you less to install, but when you add to their initial first cost the continual cost of operation and repairs, the Hill Ram is the most economical.

WE ABSOLUTELY GUARANTEE THE SUCCESSFUL OPERATION OF EVERY RAM WE SELL.

WE PROTECT YOU IN EVERY WAY

12 DIFFERENT SIZES

One of our twelve different sized Rams is sure to fit your requirements. We manufacture them from the small No. 1 Hill Ram, for household watering systems, to the massive No. 24 Ram for large, extensive irrigation projects. All you need is a spring, pond or stream, with the necessary head of water. The Hill Ram does the rest without operating or upkeep cost. One of our guaranteed Rams will prove to be as valuable as any piece of machinery you have on your farm.

FIRST AND ONLY COST, MACHINE

The Hill Ram is an actual "first-and-only-cost" machine. There is nothing to get out of order, no delicate mechanism to succumb to rough usage. Ordinary rams have a fixed operating and upkeep cost, the maintenance cost of the Hill Ram is practically insignificant and this alone constitutes a saving that will pay for the initial cost of a Hill Ram in a short time.

COSTS NOTHING TO INVESTIGATE

Our staff of expert hydraulic engineers will analyze your irrigating problems and suggest the most efficient and economical method of putting water on ten or ten thousand acres. This valuable advice is Free to you whether you buy or not. Just fill out the coupon in the lower right-hand corner, mail it to us and we will write you explaining how a suitable irrigation system can be installed on your farm at the lowest possible cost to you.

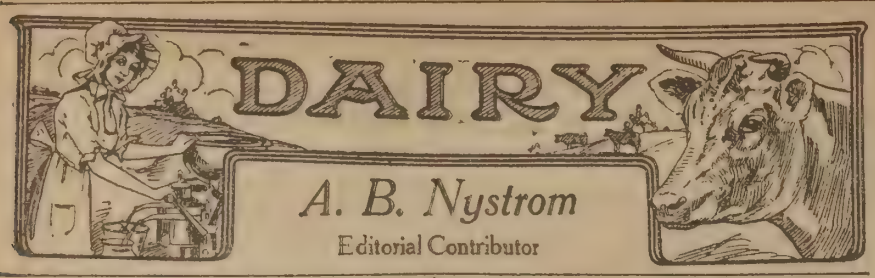
Gentlemen:



Please send without cost to me Bulletins "A" and "B" on the subject of Hill Hydraulic Rams—also cost, estimate and method of irrigating under the conditions specified below. It is understood that I will not be charged one cent for this service and will not be under obligation to buy.

Name.....

Address.....

1. *Supply head—vertical fall in feet*.....
2. *Distance in which this fall can be obtained*.....
3. *Vertical height above ram water is to be raised*.....
4. *Length of delivery pipe required*.....
5. *Available flow of water in cubic feet per sec. or gals. per min.*.....
6. *Quantity of water required to be pumped*.....
7. *If for irrigation purposes, quantity of land to be irrigated*.....
8. *Remarks or additional data, as use for which water is intended, etc.*.....

All estimates are based on the use of new pipe, as it is manifestly impossible to estimate friction in old pipe. If Pipe is already on hand, state size and time it has been in use. We furnish pipe and fittings if desired and prices may be had on application.

Cream

37 1-4 Pounds Bring $16.39

By Edward Louis Sachtler.

What is probably the largest check ever paid for a single can of cream in Clarke county, and perhaps southwest Washington, was received by James N. Hibbard, a dairyman and rancher about two miles east of Ridgefield, when he shipped a 10-gallon can of cream last month and in payment received a check amounting to $16.39. The can and cream together weighed 81 pounds, while the cream itself weighed 37 1-4 pounds, netting the dairyman 44 cents a pound. The cream was shipped to the Vancouver (Wash.) creamery, 17 miles southeast of here. The company claims that it was the biggest check ever issued by it for a single can of cream in all its experience in the creamery business.

Small Herd of Cows.

Mr. Hibbard has a small herd of choice dairy cattle of the celebrated Jersey and Guernsey breed and exercises particular pains in caring for his herd of "bread winners" and "mortgage lifters."

Honor Roll

Bred Up From High Producers

In the report of C. P. Dean, tester for the Jefferson county (Washington) Cow Testing association for December George Hendrick's herd of nine cows shows the highest average, having 49.13 pounds of butter fat as an average for the month.

Princess, a grade Holstein, owned by H. L. Hansen, was high cow in milk and butter fat production. This cow had over a ton of milk (2086 pounds), containing 76.26 pounds of butter fat, to her credit.

Fourteen cows made the "honor list" with a showing of 50 pounds of butter fat or better.

The following owners had cows producing between 40 and 50 pounds of butter fat:

Glendale Creamery Co.	2
Burt McConnoghy	4
H. Nisbet	1
Tony Stine	1
Fred Stutler	2
Miss Mamie Chase	1
H. L. Hansen	2

An inquiry, regarding the ancestry of these high producing cows, show that they have been bred up from "high producing ancestors." These cows also received a balanced ration which contained a variety of feeds, including hay, grain and succulent feed in the form of roots or silage. Every cow on the "roll of honor" received either silage or roots as a part of her ration.

Succulent feeds are one of the most important parts of the winter ration for dairy cows, as is well demonstrated by the results being obtained by the association members.

Cow Testing

Herd Averages 33.54 Pounds

The December record of the Boise Valley Cow Testing association shows that the test was administered to 416 cows, which produced an average of 25.7 pounds of butterfat each.

The report for December on the highest producing cows and the highest producing herds is as follows:

Highest producing cows of their breeds, for the month: Holstein, 54.4 pounds, A. Records; Guernsey, 52 pounds, H. A. Wines; Jersey, 52.8 pounds, S. Lee; Brown Swiss, 37.2 pounds, F. G. Amack; Shorthorn, 39.7 pounds, M. E. Pratt; Red Polled, 27.1 pounds, W. J. Potter.

Highest herds—A. Records, eight Holsteins, average fat 33.54 pounds; David Tate, three Jerseys, average fat 33.5 pounds; F. O. Johnson, 16 Holsteins, average fat, 33.26 pounds; E. G. Amack, 12 mixed, average fat, 32.91 pounds; S. Lee, eight Jerseys, average fat 32.45 pounds; D. W. Gray, four Jerseys, average fat 31.57 pounds; H. A. Wines, 10 Guernseys, average fat 30.85 pounds; W. J. Potter, 16 mixed, average fat, 30.14 pounds.

Questions

Are Answered by A. B. Nystrom

When there is no succulent feed raised on the farm, about how much grain feed can safely be fed to a cow per day? How many kinds of feed and how many pounds of each, and how many times a day, should be fed?

I. E. O., East Stanwood.

When you have no succulent feed I believe that it would be wise for you to get some dried beet pulp and soak it over night in four to five times its weight of water and feed that instead. You can use from five to seven pounds of the dried pulp and it will make from 25 to 35 pounds of the soaked pulp. Of course, a heavy grain ration will keep up the milk flow, but we find that grain is so high priced just now that it is not economical to feed much of it. Our method of feeding is usually that of feeding one pound of grain per day for each pound of fat that the cow produces in a week. It is much better to have a mixture of grain and if you will let me know what you have on hand and the prices for them, I shall be glad to make out a ration for you, or perhaps you will be able to get the information from the bulletin on "Feeding Dairy Cows" put out by the experiment station here at Pullman.

Feeding Before Freshening.

How long should a cow be fed on grain before coming fresh, and would it be advisable to feed as heavy before as after freshening?

I. E. O., East Stanwood.

After a cow is dried up she should be fed liberally for about four weeks and then the feeding should consist largely of laxative feeds, such as bran and oats, and assuming that the cow is dry for six weeks or more, the light ration should be fed the last two weeks. The cow's bowels must be in good condition previous to freshening or she is likely to have difficulty during calving time.

Feeding Wheat Hay.

I am thinking of going into a small dairy and beef cattle business as a side line on a wheat ranch. I have some rough land for pasture. I have a lot of wheat hay which I want to convert into cream, as butter fat is 40 cents per pound. What must I feed for best results with wheat hay? I can get beet pulp for $29, alfalfa meal for $30, and oil meal for $3.25 per cwt.

H. D. E., Columbia River.

I note that you are thinking of going into the dairy business in a small way. I have no doubt that you can make a success in that section, but you will have difficulty in getting the best results from the use of wheat hay. I think that wheat hay makes very good feed for other stock, including horses and beef cattle, but it does not seem to do so well for dairy cows. A small amount can be used as a filler, but as a rule it is not very palatable and does not contain a very high percentage of protein, which is a necessary part of the ration of every dairy. We always get better results from the legume hay, such as alfalfa, sweet clover, etc., but with what you have on hand I think you can get the best results by the following combination: Feed from 10 to 12 pounds of wheat hay per day to each cow, and in addition get some of the beet pulp and soak it over night in four to five times its weight of water. Feed five or six pounds of this dried pulp, which has been soaked over night, to each cow daily. You may get fair results by adding some alfala meal to this beet pulp and soaking it, but perhaps equally good results can be obtained by feeding the alfalfa meal dry. I would suggest that you mix alfalfa meal and oil meal in the proportion of four of the former to one of the latter, feeding this to the cows at the rate of one pound for each three to three and a half pounds of milk the cow produces. I think this is the best combination you can make out of the feed you have mentioned. If you can get some oats at a reasonable rate I would mix in some of this with your grain feed, and use some bran if you can get it. With these extra feeds added your mixture should be about as follows: Three parts of alfalfa meal, three of bran, two of oats and one of oil meal. If you find this to be a little too laxative you may cut down the oil meal to one-half.

SIXTY-FOUR POUNDS

Nine-Year-Old Jersey Makes Record.

James R. Greenlee, official tester, sends The Farmer the list of cows in the Washington county, Ore., Farmers' Cow Testing association, giving 40 or more pounds of milk during the month ending November 30, 1916. The highest producing cow is that of John Vandervelden, a 9-year-old Jersey, with a record of 1344 pounds of milk, 4.8 per cent, and a total of 64.51 pounds of butter fat. This was the only cow giving over 60 pounds of milk. The next highest producer was also one of John Vandervelden's, a 9-year-old Jersey, giving 1034 pounds of milk, 5.6 per cent, and total of 57.96 pounds of butter fat. Mr. Vandervelden had more than five cows producing more than 50 pounds of butter fat during the month. Charles Bamford had a great cow giving 1345 pounds of 4 per cent milk producing 54.60 pounds of butter fat. Fred Wilson's 7-year-old Jersey gave 1110 pounds of 5.1 per cent milk, producing 56.61 pounds of butter fat. A 6-year-old cow of C. J. James gave 901 pounds of 6.2 per cent milk which produced 55.80 pounds of butter fat.

ANKER-HOLTH

Now is the time to trade in that old separator on an Anker-Holth, and have one that will get all the butterfat while it is a good price.

Remember, the Anker-Holth is the latest invention in Cream Separator construction and has many new features that no others possess, and the hundreds of machines that we have placed in the homes of users in the last two years are proof of its superiority.

When you buy an Anker-Holth Cream Separator, get an Anker-Holth Speed Indicator that will insure correct turning and save their price every month.

Perfection Milking Machines do the best of work and guaranteed to do it right.

Sisal Hemp Monopoly

American Bankers Financed Yucatan Growers

All grain growers know that the price of binding twine has gone up outrageously, but possibly not all of them know the reason for the advance.

Sisal hemp, the fiber from which binding twines are largely made, comes to this country almost entirely from the Mexican state of Yucatan. The Yucatan growers have organized a monopoly and a group of American bankers is financing them. Whether they can be reached through the laws of the United States is a question which a special committee of the United States senate confesses itself unable to answer. That question the committee has just referred to the attorney general of the United States.

Sisal consumption has grown to enormous volume in the United States. The senate committee says that in 1914 the International Harvester company alone used 584,000 tons, and other manufacturers imported about 200,000 tons.

The state prisons manufacturing twine, listed in the order of their consumption of sisal are:

Minnesota, 43,400 tons.
Michigan, 25,000 tons.
South Dakota, 11,300 tons.
Wisconsin, 8650 tons.
Indiana, 7500 tons.
North Dakota, 5700 tons.
Missouri, 2000 tons.

In its report the senate committee says:

"The committee feels that the facts set forth herein demonstrate that the American people are being forced to pay for one of the necessities of life many millions more than the fair value thereof, and it therefore refers this report to the state department, with the suggestion that the matter be taken up hrough diplomatic channels to see if some measure of relief can not be obtained.

"The committee urges the farmers of the country to make every effort to find a suitable substitute for sisal which can be grown within the United States at reasonable cost, in order that they may no longer be in the power of a foreign monopoly for so essential a product as binder twine. This report is referred to the department of agriculture with the recommendation that it make special investigations toward this end.

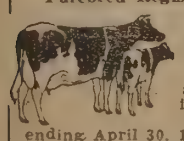
"It seems clear that the Comision Reguladora is an agency of the Yucatan government, and not such a person or corporation as is contemplated in our anti-trust statutes. Moreover, it is an association composed of agriculturalists instituted for mutual help, not having any capital stock and not conducted for corporate profit, its purpose being to enable its members, composed of all the sisal growers of Yucatan, to get better prices for their products.

"Beyond question this association is a monopoly formed for the purpose of controlling the sisal market which it is doing most effectively. But the combination to control the output of sisal, which constitutes the monopoly, was conceived and carried out in Yucatan by the Yucatan government and not in the United States. The offense, if there be one, does not consist in raising the price of sisal to 14 1-2 cents, but in the combination to get control of the sisal market and monopolize it with the resultant power to fix this exorbitant price. As this monopoly is beyond the territory of the United States, it is difficult to see how it can be reached, though possibly the actions of its agents in this country may come within the purview of our anti-trust laws."

The report says: "There was no evidence before the committee to show any combination of monopoly in the handling or manufacturing of sisal or binder twine in the United States during the years 1915 and 1916, except as stated herein. There was active competition both in the purchase of the raw material and in the manufacture and sale of binder twine during those years.

"No complaints were made about alleged monopolies or combinations in Manila hemp, or in regard to the manufactured product made from it. While there has been considerable advance in the price of Manila hemp during the last two years, and for the greater portion of the time it was relatively much higher than sisal, at the present time the two products are about on a parity.

"But whether or not our laws have been violated by the Comision Reguladora or its agents, there can be no question that its conduct is a most oppressive monopoly, which holds in its grasp our importations of sisal and which is costing American farmers many millions annually. The arbitrary power of the commission to fix the price of sisal is most dangerous, and its action in doubling that price since the hearings before this committee closed last April can not be too severely condemned. The committee will make certain recommendations in the hope that some relief may be afforded.



"The position of the Pan-American corporation is altogether different from that of the Comision Reguladora. The former is an American corporation, and amenable to our laws if they have been violated. The evidence shows very conclusively that the Comision Reguladora, which was created in 1912, exercised practically no influence upon the sisal market until the Pan-American corporation agreed to finance it and furnished the money necessary to carry out its operations.

"Almost immediately thereafter the comision assumed active charge and complete control of the sisal business, which it still retains. Without the aid of these American bankers, who keep $10,000,000 constantly at the disposal of the Comision Reguladora, it would have been unable to perfect and carry out its monopolistic combination to control the sisal market and fix the price regardless of the law of supply and demand and entirely at its own option. There can be no doubt that the Pan-American corporation gave real existence to the Comision Reguladora and was essential to its success."

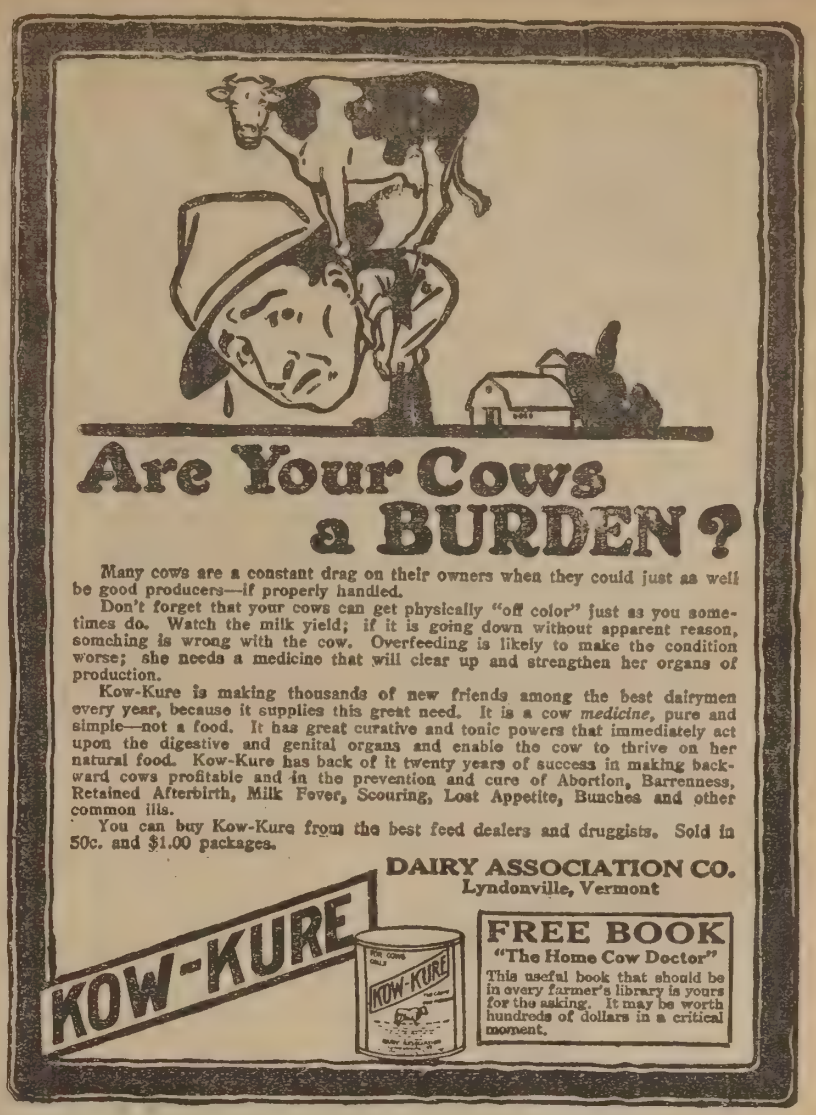
Alfalfa

As to Yellow-Flowered Variety

After eight years of experimentation with the yellow-flowered alfalfa known to botanists as **Medicago falcata**, plant specialists of the United States department of agriculture feel that the plant can not yet be re commended for general cultivation. They believe, however, that because of certain desirable characteristics, some strains of the species will be valuable for use in plant breeding and that from hybrids resulting from crossing this yellow-flowered alfalfa with the common alfalfa hardy types more valuable than any now cultivated should be developed. With this end in view the department specialists will continue their experiments.

The chief defects which make the species undesirable for general cultivation under present conditions are its failure to recover quickly after mowing, and its poor seeding habits. These characteristics, in most cases, make impossible the cutting of more than one crop of hay and make the harvesting of sufficient seed for planting purposes exceedingly difficult and costly.

Standing Merchantable Timber.



Revised estimates place the amount of standing merchantable timber in the United States at approximately 2767 billion board feet. Of this amount 1464 billion board feet, or 53 per cent of the total, is in California, Washington, Oregon, Idaho and Montana.

Marmalade Stock Ample.

Germany's supplies of marmalade are sufficient for the army and civil population until June, the Overseas News Agency says. The marmalade is being distributed to municipal authorities, by whom it will be retailed at 14 or 15 cents a pound.

Insect Trap.

An inventor has bought out an insect trap that can be screwed into the top of a fruit jar.

Where the Cuts of Beef Come From

The accompanying photograph, while that of a famous steer which a few years ago was awarded the grand championship at the Chicago International Live Stock show, is designed to show where the various grades of beef come from in the case of any beef animal. The prices quoted are those compiled by Howard R. Smith of the First National Bank of St. Paul of date September 1, 1916, in his booklet, "Live Stock for the Northwest," from which they are taken.

The variance in price—from 8 cents to 26 cents per pound—indicates to some degree the possibility of developing beef cattle in such a way as to increase the relative weight of the valuable cuts of meat. The prices, together with weights of the various cuts of this grand champion steer, follow:

1. Round, 230 lbs. at.....15c
2. Loin, 170 lbs. at 26c
3. Rib, 90 lbs. at 19c
4. Chuck, 260 lbs. at.....12c
5. Shank, 40 lbs. at 6c
6. Flank, 40 lbs. at 9c
7. Plate, 130 lbs. at 8c

Suet, 40 lbs. at 8c

Hog Raisers

Railroad Transportation Charges

By J. H. BAISLEY, Baker, Ore.

What I consider a very fallacious report is now being heralded throughout the northwest relative to the exact reason why many growers are bidding farewell to the so-called "mortgage lifter," which name, to some hog raisers, may be a misnomer. We are informed by certain person, who are in a position to be in close touch with the situation, that the real cause of some quitting the game is the excessive transportation charges by the various railroads. This contention is no doubt true in some instances, especially where the producer is remotely situated as to the best available market, which, as to the shippers or growers in this immediate section, does not apply. We are but 357 miles from the Portland market, the freight rate being $89 per car of 20,000 pounds, which amounts to about 45 cents per hundred delivered at North Portland, the Union stock yards.

There is absolutely no serious question of doubt involved, under the claim of the long haul, that a very large per cent of the gross proceeds is consumed by the freight charges, but which proves a material factor of profit in favor of growers more proximately situated. This advantageous feature of location for the nearby producers, however, not enjoyed by their distant brothers, is a fixed condition not easily eliminated. The reduction of rates will inevitably inure pro rata to both alike; but, nevertheless, I express an unqualified opinion that rates can be amicably and equitably adjusted so that both railroad and producer will be greatly benefited thereby; as there are no two endeavors more conducive to the upbuilding of a country's internal resources than its railroad facilities and the growing of live stock.

We should, then, encourage the most harmonious cooperation to accomplish the desired results.

The growers, who are turning their faces against the hog industry in this section, are doing so for various expressed reasons. Some will say, "that there is absolutely nothing in the culture of swine; that the first cost of constructing hog-tight fences, necessary buildings and other equipment is prohibitive; that the fluctuating market prices of pork is decidedly discouraging and unprofitable; that the present high priced grain can not be fed without the grower sustains a loss. No one here, so far as my knowledge extends, has ever mentioned transportation rates, as they have never considered this a certain fixed charge.

The raising of swine, under the most favorable apparent condition, is not always profitable. There may be a present congestion created in the market. If hogs are coming in rapidly, finished or unfinished, there may be juggling among the respective buyers, as they usually know when to play their trump card, their one great ambition being to purchase as cheaply as possible. If one's hogs are finished at this particular time, regardless of cost of production, he is obliged to make a sacrifice in favor of the buyers, who will reap a rich harvest, the grower will sustain an irretrievable loss, and the consumer, who is unaware of the transaction, will pay the same old price for the meat he consumes. "Consistency, thou art a jewel," even though the supply of pork be normal. This is certainly a most critical time, if grain reaches a high level, for the grower who is raising hogs for profit, as his brother producer, because of the promising price of grain, immediately sacrifices his own hogs, his brother's hogs and paralyzes the market. This class of spasmodic swine dabblers should forever quit the field, choose a more congenial occupation and not suffer other growers to lose heavily by reason of their injudicious acts.

African Wool

Sale of Fine Clip of Merino

A very fine clip of Merino wool grown in the Somerset East District of South Africa was recently sold on the local market at record prices.

This clip consisted of 19 bales of super hoggets for which 38 cents per pound was paid; eight bales of ewes, six bales of wethers, and two bales of stud, all of which were sold at 37 cents per pound; three bales of 11 months selling for 32 cents, one bale of six months selling at 25 cents, eight bales of backs and bellies at 25 cents, and two bales of locks at 14 cents.

The clip was well prepared for market exhibit, was light in condition, well grown, of good length, and fine in quality. Local experts stated that this wool would compare favorably with the same class of wools grown in any part of the world.

Naturally this is gratifying from the standpoint of the South African wool grower, and shows the beneficial results of the efforts made in recent years to improve the quality of all South African wools.

Skagit County Fair.

During 1916 the Skagit County Fair association spent $5,117.22 for improvement of its grounds and still broke even financially.

Grain Still In Storage.

It is estimated that owing to the shortage of cars two-thirds of the 1916 grain crop in the locality of Albion, Wash., is still in the warehouses. Cars are becoming more plentiful, however.

Veterinary

Dr. S. B. Nelson

Can you recommend anything for removing black warts from a cow's teats? They grow for two or three weeks and then fall off. F. P.
Seattle, Wash.

I would recommend the application once a day or once every other day, of American oil to the type of warts which you describe affecting your cow. If you do not get good results from this treatment, write to Dr. S. B. Nelson, Pullman, Wash., and he will give further advice.

I have a horse that has pin worms. Have tried several remedies but they seemed to do as much harm as the worms and gave him no relief.
Othello, Wash. J. M. D.

I would recommend giving your horse two drams of powdered iron sulphate morning and evening for a week, then giving the following treatment: One quart of raw linseed with one ounce of turpentine well mixed with it. This treatment has given good results in many, many cases of this trouble. It is not a sure cure. It has never hurt a horse to my knowledge.

I have a mare that has enlargements just above the hoofs of her front feet. It does not seem to be sore when you touch it, yet she shows a little lameness when walking. I suppose it is ringbone or sidebone. O. J. C.
Outlook, Wash.

If the swelling that you describe is mostly in front of the hoof above the hoof then the chances are that the trouble may be ringbone. If the swelling, however, is back past the middle of the foot, and one on each side, then it is probably sidebone. For ringbone, the best treatment is to fire with a hot iron and blister with a severe blister. You should have a veterinarian do this work for you. If it is sidebone some good results have been obtained from the following treatment: Begin by placing on each side of the foot just below the side bones on the inside and outside quarters three creases, about one-half to three-quarters on an inch apart, just below the white growing tissue at the top of the hoof. Then follow the grain of the foot down to to the sole, making a crease with a hoof knife straight through the hoof until you get so that you nearly draw blood, cut through the outside of the hoof down in the white, through the soft part until you nearly draw blood. Do that in three creases on each side. Then treat the hoof morning and evening with the following treatment, applying it just at the hair line of the hoof; Lard, one part; pine tar, one part. Heat gently and mix; then let cool. The effect of this treatment is that it first causes the hoof to spread, and enlarging the hoof does away with the pain when the horse steps on the hoof. Secondly, the ointment softens the foot and causes it to grow more rapidly, and grows a larger hoof than the horse formerly had.

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY
Gombault's
Caustic Balsam
IT HAS NO EQUAL
For the Human Body —It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Exterior Cancers, Boils Corns and Bunions, CAUSTIC BALSAM has no equal as a Liniment.
We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.
A Perfectly Safe and Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Strains, Lumbago, Diphtheria, Sore Lungs, Rheumatism and all Stiff Joints

All your calf-feeding problems are solved by LILLY'S Calf Meal. Not only feeds but feeds absolutely right, and cuts the cost one-half. All dealers sell it.
LILLY'S Seattle and Portland

After a hen has been mated with the male she will lay a fertile egg in two days, assuming that the hen is in normal condition and a perfect mating has occurred. However, it will be about a week before all the hens in the flock will show a good state of fertility. One may take a chance on them after the flock has been mated two or three days if for any special reason it is desired to hatch as many of them as possible.

It has been shown by experiment that eggs laid 20 days after a mating may be fertile. In the eggs taken from an entire flock, however, there would be few showing fertility after the male had been removed for 20 days. To insure infertility at least three weeks should elapse after the male has been removed. J. D.

Housing

Successful Methods at Petaluma

By James Dryden.

At the recent farmers' week at the Oregon Agricultural college, Mr. George of Petaluma, Cal., made the interesting statement that many of the colony houses on the successful poultry farms there had been built at a cost of 7 1-2 cents per hen. The house is 8x12 feet, usually, and cost to build $7.50, and in this house 100 hens were housed. The construction necessarily was cheap. There was no floor in it and no dropping boards and the nests were outside in a separate laying house or attached to the outside of the roosting place. In that climate the fowls are outdoors practically all the time, and where they have free range no scratching room is furnished.

Another surprising statement made by Mr. George was that he could clean out 40 such houses in an hour's time or less, with the help of a team of horses. The cleaning was done in the moving. There was no floor in the house, and the droppings were left behind on the ground where they fell to fertilize the ground. The work of cleaning was therefore accomplished by moving the house on to clean ground with a team of horses. If the droppings were to be scattered, that would entail extra time.

After that who will deny that the colony house has certain advantages in the saving of labor over the long stationary house with floors, dropping boards to clean, etc.

These methods, of course, could not be used in cold sections during the winter when snow covers the ground several months of the year.

Some of the poultry farmers at Petaluma, Mr. George stated, are now building large stationary houses. A few years ago on a visit there I discovered that the long stationary house was without friends. The large house was strongly condemned. It will be interesting to see after a few years trial whether the large house gives results as good as have been obtained there with the small colony house. Many changes have taken place in accepted opinions of various poultry keeping practices during the past 10 or 20 years, and the Petaluma poultry raiser will be excused if he too should change his opinions. The present improved condition of commercial poultry keeping has been brought about by changes of viewpoint. Sometimes the change has been for the worse. Let us hope that Petaulma may not be making progress backward if it changes the system of housing that has been one of the features, if not one of the main causes, of its great poultry development.

This Single Comb Rhode Island Red pullet won first place in her class at the 1917 show of the Idaho State association at Boise. She is owned by Mrs. Belle Silversmith of Boise.

State Aid

Is Suggested for Poultry Shows

Though the eighth annual poultry show at Boise, Idaho, under the auspices of the Idaho State Poultry and Pet Stock association, was the most successful ever held in that state from many standpoints, a plan is said to be under way looking toward securing aid from the the state in financing the two annual shows, one of which is to be held in northern Idaho and one in southern. The recent show at Boise was financed by the business interests of that city.

There were more than 500 birds exhibited, most of them by Idaho poultry raisers, but some from Oregon and Utah.

A feature of the show was an auction sale of birds donated by members of the association, the proceeds going into the treasury to help defray expenses. Twelve trios of birds were sold by Auctioneers Marsters and Stanley, bringing an average of $4 a trio.

William M. Coats of Vancouver gave excellent satisfaction as judge of the exhibits. This was his 23d show this season.

The poultry association proved to be live and active, and the following new members were added to the rolls during the show:

F. E. Newell, Caldwell; Eugene McGoldrick, Imbler, Ore.; A. F. Vystroil, Boise; Mrs. R. W. Barder, Boise; Mrs. W. P. Dinsley, Boise; W. D. Stanley, Boise; Mrs. George Gregory, Meridian; John Belcher, Boise; Mrs. Margaret Houck, Boise; Francis N. Nelson, Boise; Ira R. Aldrich, Boise.

In testimonial of their appreciation of her work as secretary of the association the fifty members who gathered about the annual banquet presented Mrs. Belle Silversmith with a beautiful basket bouquet.

Number of Hens to the Male.

The breeding season is now about here, and the question as to how many hens a male can serve is frequently asked. Ten to 15 hens to the male is usually recommended. The ferility of eggs will be as good with this number as with less. It is a question whether the number of hens may not be increased considerably with equally good results. I have mated three males to 75 hens with good results. It is a mistake to use too many males for several reasons. There should be a careful selection of males. The good breeder will limit the number of males as much as possible with the idea of breeding only from the best. It should be his aim to get not so much a high percentage of fertility as to secure high fecundity in the offspring. It he has 25 or 30 hens he wishes to breed from and two males, one of which is from a heavy laying strain and the other not, I would use the one good male and kill the other and take chances on getting lower fertility for the chance if not certainty of getting better laying qualities in the offspring. On the average farm there are more males than are necessary. They should be culled out to one to at least 15 hens. J. D.

Southwest Washington Fair.

The Southwest Fair association met in Chehalis and reelected F. B. Hubbard president, George R. Walker secretary. J. T. Bivin was elected chairman to succeed T. J. Long, the retiring member of the board. Secretary Walker was instructed to advertise for bids for the 1917 premium list.

Prune Outlook

Biggest Crop Moving Right Along

By Mrs. Thomas Carmichael, Gaston, Ore.

The prune situation in this part of the valley (Yamhill and Washington counties) has been very successful this year, all of the growers of the Gales Creek, David's Hill, Dilley, Forest Grove, Gaston and Wapato sections reporting a good full crop. Many small orchards which in former years were left untouched, received full attention this year and made good money for their owners. As prune picking did not begin until after hop picking was over, about September 20, the help question was not a difficult one, and with a ready market and good prices every farmer who had a prune orchard found it worth while to harvest his fruit. Most of the growers sold their dried fruit for from 6 to 7 cents a pounds.

John F. Forbis, the largest prune grower hereabouts, had a prune crop that would he hard to beat. From 50 acres of bearing trees he got 100 tons of dried fruit, for which he received 6 1-2 cents a pound. His drying capacity of three tons a day was not able to handle the crop and he had to build more driers.

Mr. Forbis and W. K. Newell, the well-known fruit grower of Seghers, had made all plans to ship a carload of fresh prunes to the eastern market when the threatened railroad strike made the venture too hazardous and the deal was called off. This would have opened up a new field for the Oregon prune and it is thought there will be no trouble to make it popular. These growers will probably try it again next year with better conditions.

Two small growers, who were well pleased with their prune harvest this fall, and who kept close records of expenditures and receipts, are John Blum of Wapato and Thomas Blum of the Gaston district.

John Blum realized $2000 from his five and a half acres, selling his dried fruit at 7 cents a pound. His harvest was 52 tons of green fruit and he took care of his own crop, his drier having a capacity of two tons a day. His harvest lasted 20 days and he employed three pickers. He also had three men in the drier and he himself put in full time.

Thomas Blum harvested 25 1-2 tons of prunes from his four-acre orchard, hauling the green fruit in bushel boxes by wagon to a drier at Yamhill, his check for the green fruit amounting to $640. The picking was done by small boys, and Mr. Blum figures the cost of harvesting his prunes at $33, not counting his own time and the hauling of 16 loads to Yamhill. His harvest lasted 17 days and he had no trouble to get help. This is a 20-year old orchard on the Newman farm in the Patton valley district weat of Gaston.

Finally, to quote one of the acknowledged authorities on prune growing in Oregon, W. K. Newell, who has kept in touch with the prune situation: "The biggest prune crop the northwest has ever produced is moving right along, and all to be consumed in the United States. One of the largest wholesale distributors in Portland (the Mason-Ehrman Co.) thought that with the European trade cut off prunes would go slowly, but every pound is spoken for and there is room for more."

Insects Not Always Enemies

Speaker before orchardists makes plea for propagation and preservation of certain insects that help the farmer and fruit grower destroy pests that annually do large damage in the northwest.

This is the seventh in a series of articles summarizing the addresses and the discussions of orchard problems at the apple conference held in Spokane in connection with the ninth annual apple show.

Somebody once said something like this: "Common fleas have little fleas upon their backs to bite 'em; these little fleas have smaller fleas, and so ad infinitum."

E. J. Newcomer of the U. S. department of agriculture applied this doctrine to insects found in the orchards and on the farms of the northwest in his address at the apple conference. He discussed three kinds of common insects which, by feeding upon other insects, made themselves one of the farmers' and orchardists' best helpers. They are the common ladybird, the Syrphus fly and the lace-wing fly. In part Mr. Newcomer's treatment of the subject follows:

"It is difficult to estimate the value of these beneficial insects. Their work depends entirely on the abundance of their hosts. If the pest they feed upon is scarce, they are correspondingly scarce, and when perhaps on account of this scarcity of the parasites, the pest begins to increase in numbers, the parasites will also increase. It is almost an axiom among entomologists that when we find a pest becoming alarmingly abundant in one season, we will find its parasites correspondingly abundant the next season, and the pest will practically disappear.

Import Ladybirds.

"In some instances, notably in California, it has been found expedient to rear artificially, or to collect these beneficial insects, and to distribute them to the farmers who need them. The horticultural commission of California annually sends literally tons of ladybirds to the melon growers of the Imperial valley, these ladybirds being collected in certain favored spots in the mountains where they winter in incredible numbers.

"Many of these parasites and predatory insects are of direct value to you who own orchards. The San Jose scale has some very minute parasites that help to control its numbers, and certain predaceous ladybirds feed upon it. The apple worm has an enemy, unfortunately not very common, a trim, black and brown wasp that pierces the cocoon and deposits an egg in the worm, so that in the spring, instead of a codling moth, another slim, black and brown wasp emerges from the cocoon to keep up the good work. The aphids, or plant lice, however, are the most beset with foes. There is a minute parasite wasp that lays its eggs in the green aphids, the larva from which feed upon the aphids and destroy them; there is an almost equally minute fly whose larva goes about sucking the blood from them; and there are long, gray and brown beetles that feed ravenously upon them. But I will limit my detailed account to three of the more important predaceous insects of the northwest. These are the ladybirds, the Syrphus flies, or hover flies, and the lacewing flies. All of these insects feed almost exclusively on the aphids or plant lice.

The Aphis Destroyer.

"Let us take the ladybirds first, since these are without question the most important, and are certainly known to all of you. These are the familiar, small, rounded, shining, red or orange beetles, usually decorated with small black spots. They feed voraciously, picking up aphis after aphis in their jaws, devouring the soft parts, and rejecting only the legs and wings. They deposit their eggs on the leaves or fruits or branches.

"The young larva of the ladybird is usually black, and as it grows older and larger, it becomes grayish, and various yellow or orange spots and markings appear on it. It is elongated, and provided with six very efficient legs, and is always actively searching about for aphids upon which to feed. It grows very rapidly, and in warm weather will become full-grown in two or three weeks.

"A single ladybird, during its life of a month or more, will deposit from 500 to 1500 eggs.

"A larva, when first hatched, will eat only two or three aphids a day, and when full-grown will dispose of from 50 to 100 daily. The average number eaten by a single larva during its two weeks of life is approximately 500 or 600 aphids. An adult beetle, during warm weather, will eat from 60 to 75 aphids daily, and since the beetles live from one to two months, a single beetle will consume during its life no less than 2000 or 3000 aphids.

Fly Less Effective.

"The Syrphus flies or hover flies, are also of great importance in an orchard. The adult flies are usually somewhat larger than the common house-fly, some of them being as large as a honey bee. Their bodies are mostly strikingly cross-striped with black and yellow, and their wings are transparent. They fly swiftly about, and have the characteristic habit of suddenly stopping and hovering motionless in mid air above or near a colony of aphids among which it is their intention to deposit eggs.

"These insects are not nearly as effective in destroying plant lice as are the ladybirds, for the simple reason that the adults do not feed on plant lice, and we have learned that the adult ladybirds consume many more aphids than do the larvae.

The Lace-Wing Fly.

"The lace-wing fly is a delicate insect, half an inch long or less, with large, lace-like wings, and long, slender feelers. Most of these are light green in color, with golden eyes, but some of the smaller species are brown. The eggs of the green species are laid in clusters, each egg upon a splender stalk, nearly half an inch long. This is supposed to be so that the hungry young larvae, upon hatching, will not eat up the unhatched eggs. The yellowish-brown larvae of the lace-wing fly, known as aphis-lions, are ferocious looking bugs, shaped something like the ladybird larvae, but with a pair of long, sickle-shaped jaws protruding in front. They wander about among the plant lice, seizing them with these terrible jaws, and holding them up with an air of great satisfaction, while the juice from the punctured victim runs down little grooves in the jaws into the mouths of the larvae.

Cannibal Insects.

"I have had a full-grown aphis-lion devour 350 aphids in a single day, by actual count, and during its short life of less than two weeks, it made away with 1400 of these pests. Unfortunately, the aphis-lion has a black side to his character that somewhat offsets his usefulness. If he happens across a young ladybird larvae, or even a smaller one of his own kind, he does not hesitate to attack it and destroy it. He makes no distinction between injurious and beneficial insects. The ladybird larvae will also occasionally but rarely devour one of its own kind.

Insects Only Help.

"Before I finish, let me say a word about the relation of this natural control of insect pests to artificial control. You might compare these beneficial insects to the fire extinguish-

Apples, Cherries, Plums, hardy nut trees, Shrubs, roses, garden roots and everything for the fruit grower. Large, well-rooted trees and plants give satisfaction and quick results.

ILLINOIS SEED AND NURSERY CO.

167 Main St., Makanda, Ill.

ers and sprinkler systems that you install in your houses and stores, and your spray outfits to the city fire department. Just because nearly every one in a city owns a fire extinguisher, you would not think of doing away with the fire department. It is necessary to control the fires that are too large or that get too much of a start for the small extinguishers. And so in your orchard. The parasites and other beneficial insects will control the smaller outbreaks of pests, and will do much to lessen the seriousness of the larger ones. But your spray outfit is necessary to combat the outbreaks that get away from the parasites. The parasites might eventually control the outbreak, just as your fire extinguisher might, in the end, control a fire, but in the meantime a great deal of damage is being done.

"The ladybirds and other insects will control your aphids only insofar as their numbers and their appetites allow them to do so. I have seen colonies of aphids completely wiped out by their enemies, but very often the aphids will multiply more rapidly than their foes, and when this occurs, you must step in and take a hand with your artificial means of control. Do not be afraid that the tobacco or other insecticide will destroy your insect friends. It may kill a few, especially the younger ones, but most of the winged adults will be able to fly away, and will doubtless find plenty of food in your neighbor's orchard, or on the wild plants by the roadside, and will return to your orchards if the aphids appear again."

On the Farm

The Men Who Build Them.

It is calculated that there are 700,000 men employed in the automobile industry in this country. The city of Detroit, Mich., is the manufacturing center of the United States so far as automobiles are concerned, there being 29 factories there, including the Ford factory, which alone employes about 25,000.

Want Uniform Auto Law.

The American Automobile association is now working on a measure to present to the legislatures of all the states of the Union with a view of having uniformity all over the United States. The association declares that the laws of some of the states on the regulation of autos are bunglesome and difficult to understand and enforce, and that there are certain points of conflict between the states that should be eliminated.

Stop at the Crossings.

There is a nation-wide movement on foot looking toward the enactment of a law in every state requiring automobiles to come to a dead stop at every railroad crossing. Not only are the railroads working for the passing of such a law, but many of the auto associations and companies are taking part. It is argued that were such law in effect it would prevent a great many accidents on crossings where machines are now driven onto the tracks without proper assurance that there is no train approaching.

Oregon License Fund.

A total of $119,987.45 will be returned to the several counties of Oregon from the motor vehicle fund, according to a statement by E. G. Patterson, manager of the automobile department of the secretary of state's office.

WANT FREE FERRY
Across Columbia River at Entiat.

Petitions are being circulated both in Chelan and Douglas counties, asking the boards of county commissioners to consider the establishing of a free ferry across the Columbia river between Orondo and Entiat, and to make appropriations for the maintenance of the same. Entiat is the shipping point for a considerable portion of Douglas county, and ferry tolls impose a heavy expense on the ranchers, especially during harvest. It is understood that the commissioners of Douglas county favor the idea.

GAME BIRDS.
To Be Fed at White Bluffs.

In order that the quail, pheasants and other game birds in the White Bluffs-Hanford district, Benton county, may not die for lack of something to eat this winter, County Game Warden M. D. O'Connell has authorized Deputy Sheriff James Shepherd to make arrangements at stores at both places for feed, which will be paid for by the game commission.

Write to the Editor

The Washington Farmer will be glad to get a letter from any subscriber at any time.

If we are making a paper that you like, tell us so. If we are making a paper in any respect that you do not like, it is yet more important that you should tell us so.

Having thousands and thousands of subscribers, of course it is out of the question to make the paper just as each subscriber would like to have it in every particular. Folks are different and like different things in their reading. This makes it interesting. We try to have something of special interest to every subscriber before we get through with it. Sometimes it takes longer, sometimes shorter to get around to the particular thing you like. It may happen that many readers enjoy one kind of reading matter and only a few another kind, so we can not be expected to give as much space to the desires of the few as to the desires of the many.

You see that it is no simple problem to get up a farm paper for a large number of people.

Then write us about any question that interests you, or any question that troubles you. We may be able to help you. Remember, that the chief difficulty in answering any question is in having the question itself plainly and correctly stated. For instance, a general question regarding the law of boundary fences can be answered easily, while the question regarding your own line fence when there is a dispute between you and your adjoining neighbor may be so intricate and have so many things connected with it which only a trained attorney could answer, after a personal interview with you.

Write us any inquiry you desire to make and we will be glad to give you the best answer possible, whether it is a simple matter of statistics or a matter requiring the advice of experts.

We want your letter, for that is the only practicable way we can talk with most of our readers. Write us anything and everything you wish, and be sure that you will get a reply containing all the information that we have at hand or that we can obtain from people who do know with respect to the particular thing about which you want information.

Vaughan's Portable Drag Saw

WILL CUT 15 TO 20 CORDS OF WOOD IN 10 HOURS

Can be operated by one man. Two men can carry complete machine. 3½ H. P. gasoline motor mounted on frame. One gallon gasoline required to cut 8 to 12 cords of wood. Engine can be used for other work without removing from frame. No gears, cogs, belts or pulleys. Friction clutch prevents breakage if saw pinches. Saw makes about 125 strokes per minute. Will cut any size log up to 6 feet. Sprockets and cranks, etc., made of cast steel. All working parts guaranteed against defects in material and workmanship.

Net cash price for complete machine as shown in cut $154 f. o. b. Spokane.

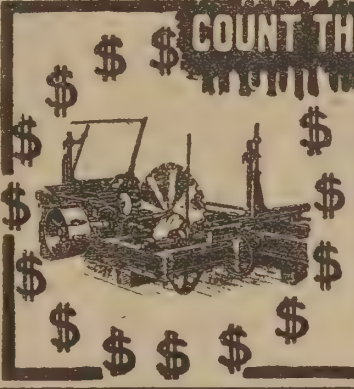
REDUCE YOUR HAULING COST WITH A FOWLER'S AUTO TRAILER

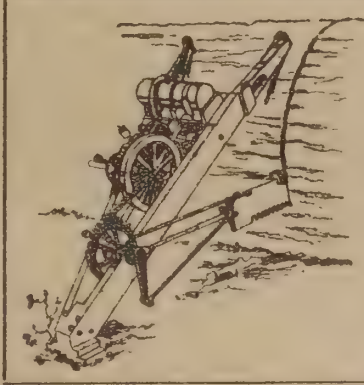
Farmers, Dairymen, Fruit Growers and Garden Truck Men are finding that the Auto Trailer solves the hauling problem on the farm.



You want a dependable, economical, and efficient trailer, one that will always oprate, and costs you little. SELLS FOR $75. Write today for free catalog, will tell you all about this wonderful trailer.

Manufactured at

Fowler's Garage & Machine Works, Inc.



Address Dept F. 1414 Broadway, Seattle, Wash.

COUNT THE DOLLARS IN YOUR TREES

Go over to the wood lot and size up your trees. Every 16-foot log averaging 14 inches thick will make 100 feet of good lumber. Ten such logs make 1000 feet of lumber worth from $25 to $40 (our book tells). An "American" Saw Mill will saw them at a cost of $4 to $5 per 1000 feet. You have the teams, the time and the engine. It will pay to get the dollars out of those trees. You can do it for your neighbors, too—more profit for you. All you need is an "American" Mill—so simple any one can run it, so strong it lasts for years. An 8 H. P. engine will cut up to 2500 feet per day. Farm lumbering is explained in our new book No. 7.

HIGGINS MACHINERY CO.
315 1st Ave. South, Seattle, Wash.

The Vaughan Portable Drag Saw

This is the original machine. They have been in use over three years and are past the experimental stage.

Simplest, Strongest, Lightest and Fastest Drag Saw Built

Chain drive; can be used in any position. Bad weather does not hinder operation; one man operates it and moves it on the log; two men can carry it anywhere.

ONE WEEK'S FREE TRIAL BEFORE ENROLMENT IF DESIRED.

Farmers Must Pay Tax

Wheat Prices Increase the Incomes

The high prices paid for wheat this season is putting many farmers into the class that pay income taxes. A force of special deputy tax collectors are working with a view to ferreting out the farmers whose incomes are large enough to make them subject to the law.

The law provides that every person whose "net annual income" is $3000, if he is a single man, or $4000 if head of a family, must voluntarily file a statement of such income with the federal authorities and pay a tax of one per cent on it. Thus, if a farmer's net income is $3000, he will be subject to a tax of $30. Next year, according to official announcement, this tax will be double, or two per cent. The law requires that persons subject to the law apply to the federal marshal, James McGovern, for income tax statement blanks to be filled out. Owing to the failure of many to do this, a force of collectors is constantly in the field checking up on the "prosperity" of the people.

Buy Munitions Abroad.

Secretary Daniels of the U. S. navy recently placed an order for a large number of shells for the navy, running up into hundreds of thousands of dollars, to a manufacturing concern in England. The English firm's bid for making the shells was about $200 per shell lower than that of the lowest American bid. Charges have been made that the contract was the result of political operations either in the United States or England, but Secretary Daniels denies the charges. It was said that the British firm was induced to place their bid low so as to throw a scare into the steel industry in America, and thereby reduce the price of steel so that the English allies might hereafter secure their munitions from this country more cheaply. This is emphatically denied.

German Raider Busy.

Twelve or more merchant ships belonging to England or her allies are lying in the ooze of the South Atlantic bottom as a result of the work of a German vessel operating as an open sea raider. The identity of the marauder has not been positively established. It appears that the crews operating the ships that have been sunk were saved, carried some time aboard the raider, and then transferred to a neutral ship met on the waters. The neutral ship has landed nearly 250 such persons, and others are reported to be safe. The activity of this German vessel almost equals that of the Emden, which, early in the war, wrought such havoc to allied shipping until destroyed by a British man of war.

Militiamen Come Back.

The federal government has ordered the return to their home states of a large part of the militia guard that has been on the Mexican border for the past several months. Over 25,000 have been ordered to return home. It is generally understood that the department of war plans also that General Pershing and his soldiers shall withdraw from Mexico, into which country they were sent nearly a year ago with instructions to capture Villa, the bandit marauder, "dead or alive." Out of this order and the operations of the Pershing forces arose the spirited controversy between the Carranza government and that of the United States that still threatens a complete break between the two governments.

Peace Goes Glimmering.

The German foreign minister has announced officially that the terms of England and her allies as outlined in their note to President Wilson makes it impossible for Germany to make any further moves toward peace at the present time, but that the war must be prosecuted by that country relentlessly.

Admiral Dewey Dies.

Admiral George Dewey, who won lasting fame when he destroyed the Spanish fleet in Manila bay early in the Spanish-American war, died at Washington, D. C., January 16, at the age of 80 years. He was the ranking officer of the U. S. navy, and will be succeeded to this position, it is unofficially stated, by Admiral W. S. Benson.

Danish West Indies.

All the formalities have been closed whereby the United States becomes the owner of the Danish West Indies. The purchase price was $25,000,000, and in addition the U. S. government relinquished whatever title it possessed in greenland, which title depended on discovery rights alone.

Yakima Valley

Production in 1916 of $16,000,000

By D. G. SUTHERLAND.

Total production in all lines for the year 1916 is $16,000,000, being an increase of $6,000,000 over the year 1915.

Estimated fruit yield 1916, 11,000 cars; on hand January 1, 1917, 2000 cars. Expressed in single shipments to relations and friends for Christmas presents, 3000 boxes.

As shown by the late U. S. census returns on the Sunnyside project, hogs have decreased in number from 32,656 in 1915 to 19,364 in 1916, over 40 per cent; cattle have increased in number 350, but decreased in value $48,000 from 1915; sheep have decreased in number 538; fowls have decreased in number 4000; there has been a total decrease in value of live stock and fowls of $84,772 from that of 1915. Increase in equipment, new silos built, $15,267, an increase of 46 2-3 per cent in value; other farm equipments $7000, a little less than 2 per cent increase in value; automobiles increased in number from 75 in 1915 to 485 in 1916, value $29,268, increase in numbers 546 2-3 per cent; Yakima county has one automobile for every 17 persons in the county.

The farmers' union, granges, beekeepers' association and farmers attending farmers' short course institute, representing in all over 100 of the leading farmers, have each passed resolutions asking the county commissioners to employ a county agriculturist for Yakima county. In the discussion of the subject it was shown that a man who now pays $100 per year taxes, by the employment of an agriculturist, would have to pay $100.03. But as the average rural taxpayer pays less than $50 per year tax the average increase would be less than 2 cents for each taxpayer.

It was shown that in counties where an agriculturist had been employed he saved the county each year, in increase of production and better prices, more than would be required to pay his salary for the next 10 years to come.

A $15,000 warehouse addition is being built by the Washington Fruit and Produce company in North Yakima. It will be of modern concrete and brick construction, two stories and basement; the cold storage temperature will be governed by an electrically operated refrigerating machine. The addition, together with their present building, will be 45 feet by 180 feet, with a capacity for storing 120 cars.

Yakima county has funds on hand showing balances aggregating $180,000, of which amount $93,000 is current expense fund, the balance road and bridge funds.

State fair will be held in North Yakima September 17 to 22.

W. W. Palmer, Bossburg, Wash.—Every man I have spoken to says The Washington Farmer is the best farm paper in the United States.

We Will Pay Salary

To Farmer With Rig or Saddle Horse

The publisher of The Washington Farmer wants men to secure and renew subscriptions to this paper in various farming districts throughout the state during the winter months. We are going to pay good salaries to those who can do the work.

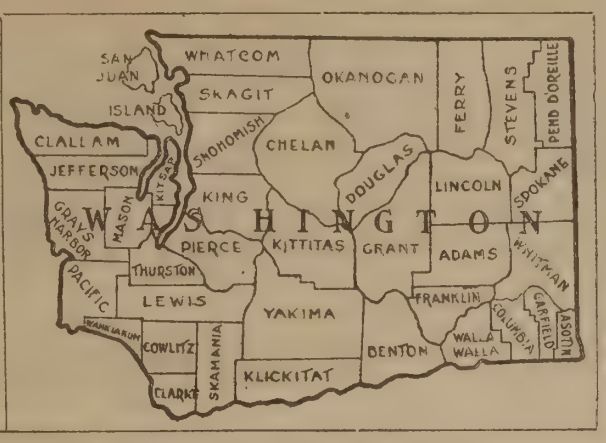
We have decided to offer these positions only to farm owners or renters.

We feel sure there are many of our readers who would like to earn some extra cash during the winter months when work around the place is slack.

We want to hear only from those who will be willing to give our proposition a fair trial for at least a month and who will put in good hard licks for good pay. For men or women with these qualifications the opportunity is a splendid one. This work isn't easy; but you can do it and earn a good salary during the winter months, without neglecting your farm chores—without being away from home more than a few hours each day. We give you full instructions and the right kind of help.

You will be able to earn a salary of from $25 to $150 per month or even more, dependent upon the amount of time and effort you can give to the work. Salary check will be sent promptly at the end of each month.

We will not consider an applicant who does not live on a farm and who does not have a rig, saddle horse or automobile. In writing us tell whether married or single, whether you own or rent your place and give the names of two merchants with whom you trade. There isn't any red tape about our proposition, but we must know something about those workers we put on our payroll to receive a monthly salary check.



Give full details in your first letter. If we get two or more applications from one neighborhood, the first will be given the preference in making our appointment. If you want a good salary proposition for the rest of the winter, don't wait till tomorrow to write us, but send your application today.

If not interested personally in the above proposition, why not get some neighbor or friend in touch with us at once who you think will appreciate an opportunity to make several hundred dollars during the winter months. You will be doing both him and us a favor.

Address your letter to Publisher The Washington Farmer, Review Building, Spokane, Wash.

Farmers in "Grain Rut"?

Adams County Man Deplores Lack of More Variation in Farm Methods in His Locality; Wants an Agriculturist Employed.

Adams County, Wash.—"The farmers are in the grain rut. The commissioners dismissed the county agent and are expecting the farmers to cooperate with the experiment farm near Lind for advanced ideas and methods."

Whatcom County, Wash.—Employment of a county agriculturist is being considered by the commissioners of Whatcom county.

In Grain Rut.

OTHELLO, Adams County, Wash., Jan. 12.—Our community is not increasing its production in grain only, but in all lines in general, and the farmers are getting better results. I would like to see more diversification in farming, but the farmers are in the grain rut, and our commissioners dismissed our county agent and are expecting the farmers to cooperate with the experiment farm near Lind for advanced ideas and methods. Not much building is going on. No fall grain has been seeded. A. O. LEE.

Want Agriculturist.

FERNDALE, Whatcom County, Wash., Jan. 15.—We have had but one short cold spell and snowfall this winter and are now having fine weather. Cattle are doing better this winter than ever before on account of the mild winter and the large hay crop of last season, and because of smaller number of stock—just enough to conveniently take care of. The price for good dairy cows is increasing, which is shown by the prices paid at local auctions. Some of the farmers are finishing out their feed on cow-kale. Farmers sold most of their old hens last fall when wheat got so high, as wheat is not raised here. There is a good market for potatoes, but farmers are not yet eager to sell. On account of the high price of powder, not much land clearing is being done this winter. The farmers are in favor of a powder plant owned by the state, or some arrangement that will provide cheap powder for land clearing. As a majority of the farmers are in favor of an expert agriculturist, the county commissioners have made known their intention of employing one. The granges and Parent-Teachers' associations are the only organizations that keep up the social life in this community. CARL J. MENZE.

Dairying Increases.

MONTBORNE, Skagit County, Wash., Dec. 27.—The dairy industry is increasing and a large number of silos have been built the past year. A large number of settlers have been buying small homes during the last two years. Very little fall grain is planted here.

JOHN B. PETERSON.

Community Was Prepared.

TWISP, Okanogan County, Wash., Jan. 8.—This community got the spirit of preparedness early and neither people nor stock suffered much from the cold. Wood is one of our natural resources, and most of the farmers do their own cutting and hauling. Most of the farmers have some stock to feed and the majority are milking a few dairy cows. Some of the farmers are after the coyotes this winter and when successful enough to capture three or four they are well rewarded for the trouble by the high prices received for the fur. Both fall and spring pigs are raised, but the spring pigs seem to be the most profitable. Some dress their hogs, but in my experience I think more money is realized by selling on foot.

GEORGE LA RUE.

Good Year in Prospect.

CENTERVILLE, Pacific County, Wash., Jan. 13.—Winter wheat has come up since the snow has melted and is looking fine, as most of it has sprouted well. A good deal of hay has been changing hands recently, selling at $18 per ton and alfalfa for $15 per ton. The ground is in fine shape to plow when not frozen, as we are having warm weather at present. It is too warm in the Columbia river district for the fruit business, although the recent cold chilled the swelling buds. Very few hogs are ready for market and the cattle are in poor shape for butchering unless fed especially for market. Not much stock is in demand on account of the high price of hay. Business in general is looking toward a good year with very few idle at present.

C. A. LESTER.

Considerable Building.

RITZVILLE, Adams County, Wash., Jan. 10.—When the weather is suitable considerable building is going on both in the country and the town. I know of only one silo in the county. We had practically no fall rains and as a consequence there was no fall seeding, and the prospect for the next season's crop is not overly bright and will depend upon the coming season. There is nothing being done here toward organizing a farm loan association.

D. A. SCOTT.

Are Interested in Roads.

BOSSBURG, Stevens County, Wash., Jan. 12.—There is quite a lot of hauling being done this winter on account of the good sleighing. Farmers are delivering hay and grain and hauling wood. The cold weather has done no damage here except to freeze some apples that were left unpicked in November. There is plenty of feed in the county and all the stock is doing well. There was but little fall plowing done and very little fall seeding, as the weather was dry. There are fewer hogs this year than usual on account of the high price of grain. Most of the farmers only raise enough for home consumption and what they do sell are dressed on the farm and shipped to Colville, Northport, and Spokane. All farmers raising pigs claim there is more profit in spring pigs, but we think there is more profit in cattle and sheep than in hogs here. We have no grange here, so the only social life is in the church and school entertainments. We are all interested in good roads more than anything at present. A number from this locality attended the road meeting held at Northport recently.

W. W. PALMER.

Fear Grain Damage.

CAMAS, Sanders County, Mont., Jan. 13.—This vicinity will increase its spring grain acreage this year. Because of the exceedingly dry fall of last year, there was not as much fall grain sown as usual. On account of the sudden cold spell after a week of warm weather, we fear the grain has been damaged. There are many new buildings going up here. We would like to see a national farm loan association in this vicinity, but on account of being under the reclamation project I am afraid we can not get in on it.

W. W. PERKINS.

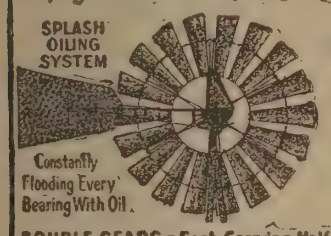
Marquis Wheat Favored.

MANHATTAN, Gallatin County, Mont., Jan. 14.—Our community is rapidly increasing its holdings of sheep, mostly pure bred. These have earned, in many instances, as high as $25 per head net, for their owner. We will have a county agent in this county, which will prove a great help to the valley. Fall grain is wintering fine. There has been a great change here in the past two year, as we used to raise 80 per cent of the fall grain, mostly Turkeys. There will be 70 per cent Marquis put in for wheat this spring.

G. M. LEWIS.

Build Pit Silos.

MILES CITY, Custer County, Mont., Jan. 16.—There are quite a large number of immigrants coming to Custer county, due to the fact that there is quite a lot of homestead land to be taken up. Last fall lots of the farmers put down pit silos and from what I hear they are well pleased with the time and money expended. It would be hard to state now the condition the fall grain is in, for the ground is covered with four or five inches of snow. All indications are that the fall grain so far is in ideal condition. Custer county will put out a larger acreage of corn next year than usual, also the interest in alfalfa seed production will be increased. C. M. YERRINGTON.



Churches Are Social.

BAKER, Baker County, Ore., Jan. 15.—The farmers' unions and churches furnish about all the social life in our community. The Pocahontas union is a very active little organization, meeting often, and having very entertaining times. We once organized a union at Wingville, a small hamlet, about one mile from my home, but it did not survive long. J. H. BAISLEY.

Wants Cooperation.

DUFUR, Wasco County, Ore., Jan. 12.—I think dairy products are the only thing on the increase unless it is fruit. Cherries and peaches are being raised a little more extensively each year. Better fences, barns, and hog houses are being built each year. What I would like to see most in this community is cooperation in shipping live stock and grain. It is hard to tell just how much damage is being done by the cold weather, but there seems to be plenty of moisture. J. A. TIDYMAN.

P&O

LIGHT DRAFT PLOWS

Built for the Field Test.

Three-Quarters of a Century of "Knowing How" Hammered Into Every One of Them.

The product of the Parlin & Orendorff Co. has always been noted for simplicity of construction, great strength and ease of operation. It was upon such a basis that the founders of this business made their implements, established their reputation, and built their factory. It is upon the same foundation that the business has been carried on to this day, and in 1917 we celebrate our Diamond Jubilee; 75 years of practical experience gained through constantly striving to provide for the exacting requirements of three generations of American farmers.

For an even three-quarters of a century we have met the demand, and today we operate the largest and oldest permanently established plow factory in the whole world. "It's the way we build them."

P&O

Light Draft Plows, Harrows, Planters and Cultivators are made in all types and sizes, to meet the conditions in all sections, and are Backed by an Unqualified Guarantee.

We also make the most complete line of Traction Engine Plows produced, and we have a special catalog devoted to these famous plows.

The P&O Little Genius Engine Gang Plow

was the most popular plow shown at all points on the 1916 National Tractor Demonstration.

We will send P & O Catalogs to any address. While P & O Implements are sold only through established implement dealers, we welcome correspondence from farmers in all sections.

War Puts Farming to the Front

"Full Use of Soil Must Be Had at All Costs, Equally With Supply of Men and Material to Army"

(From the Experiment Station Record.)

Nothing in recent years has so emphasized and impressed the real importance of agriculture and agricultural institutions as the war in Europe. It has demonstrated dependence upon this art and has raised it to a preeminent position in the welfare of the country.

Ordinarily accepted without much thought or realization by the great body of people, it has suddenly sprung into an importance second only to that of the military activities. It has become, indeed, a recognized field of war service and one of the chief elements in the national defense. Its response and the resourcefulness and practical value which its institutions have shown have brought the present position of agriculture close home to the people as never before on so broad a scale.

The problem of maintaining, and in some cases increasing, the production of food for man and beast has been one of the large and difficult ones in the countries at war. It has taxed their skill and organization, and their ability to cooperate in the common good.

The way in which this extraordinary demand has been met has furnished a new realization of the great advances in every branch of farming. It has entitled agriculture to a regard and consideration which it has not always enjoyed before. If it has not actually raised it to a new position in the lives of nations, intelligent understanding of its position has greatly broadened.

And along with the rest this supreme test has furnished an impressive illustration of the great share which agricultural investiation, education and various forms of instruction have had in placing agriculture on a higher plane of efficiency and in making it more resourceful and adequate.

The response of agriculture is in no small measure a reflection of the steady work of various classes of agricultural institutions and organizations, which has been going on quietly and often with meager support or understanding. The measure of strength of these agencies, and the extent to which there has been some form of agricultural organization to assist, has been a large factor in meeting the unusual situation.

The first efforts in the various countries centered largely on providing the machinery for gathering in and saving the crops, and in this the assistance of the military was furnished to a limited degree. But as time went on the necessity became apparent of providing for the continuance of agriculture on the highest possible plane, of keeping up the fertility of the land, of preventing the depletion of live stock, of avoiding waste of all kinds, and often of discovering and utilizing new sources of supplies. Organized effort was therefore enlarged and increasing latitude extended in the temporary use of soldiers.

The attitude of cooperation between the military and civil authorities is well illustrated by the instructions of the French minister of agriculture in transferring to district commanders the assignment of soldiers to agricultural duties. He said:

"The regular, prompt, and (as far as possible) complete execution of agricultural work constitutes one of the essential elements of national resistance and consequently one of the principal forces of success. The full use of the soil must be obtained at all costs, equally with the supply of men and material to the army, or the supply of labor to factories engaged in national defense."

Soldiers were classified on the basis of farm experience, and opportunity given them to offer themselves for temporary work in the fields. In order to avoid unfavorable reflection upon such, the idea was widely disseminated that soldiers thus volunteering to assist in farm work were not to be regarded as "shirkers," but on the contrary as men doing a double patriotic duty by fighting and by keeping their brother fighters alive.

In Great Britain the measures and appeals of the government have shown no less appreciation of the importance of agricultural work. In directing public attention to the need of special efforts the president of the board of agriculture expressed the conviction that "if agriculture had made no more progress in Germany than it has in the United Kingdom during the period 1895-1915, the Germany Empire would have been at the end of its food resources long before the second year of the war;" and he explained further that the war was being fought by that country quite as much on an agricultural as on a military organization of the nation.

In an appeal to farmers for an increase in the food production of England Lord Selborne said: "You have something more on your shoulders than your own business today. You are no longer individual farmers making your own fortunes or losing them. You are trustees on your own land to do your best for England. You have your duty quite as clear and as definite as the captain of a cruiser or the colonel of a battalion. England has a claim on you farmers, men and women of every class, as clear as she has on our sons and husbands to go and serve in the trenches."

The force of the situation in Great Britain is illustrated by the fact that of the total area of cultivated land, two-thirds is in permanent grass and only one-third in cultivated crops, whereas in Germany the proportion is exactly reverse; and, furthermore, by the fact that even in 1915, when the wheat crop was the largest for many years, three-fourths of the wheat supply of Great Britain had to be imported. In 1915 the United Kingdom imported agricultural products valued at 276,803,000 pounds, whereas in the year before the war France spent only 60,000,000 pounds for imported food products.

Similarly, in Germany the need for the greatest possible production of food has been impressed upon the people. The thorough cultivation has been urged of every available piece of land on farms and in towns, and societies have been formed to take the work in hand. Efforts have been made, for example, by the Moor Culture Union to increase vegetable growing on moor land, the society announcing allowances to disabled soldiers settling on such lands.

The measures adopted by the various nations are of much interest. The French government early applied organization to the resumption of farming in affected areas and its continuance on an efficient basis elsewhere. To save the crops the small holdings were "pooled," the inhabitants of the villages who remained being grouped together for that purpose and the assistance of the military given when circumstances allowed. The government also took measures to prevent the wholesale slaughter of live stock, first suppressing the customs duty on practically all foodstuffs, including frozen meat, and then excluding from requisition for army purposes cows in milk or in calf, brood mare, premium sires, pedigreed stock, heifers and plow oxen. Similar measures were taken in Great Britain and Germany. In the districts of France that had been invaded, the peasants were in need of horses, implements, seeds, fertilizers, forage, etc. To provide these the government made advances to the peasants, and to prevent the credit banks from breaking down from demands upon them it loaned money to the Caisses Regionales de Credit Agricole, which in turn advanced money to the cooperative societies. Steps were taken to increase the amount of gardening carried on by putting the opportunity for cultivating gardens within reach of even the humblest.

The services of school masters were enlisted to instruct children in gardening and to carry on model gardens.

In Great Britain the organization for agriculture has been greatly extended and strengthened. War agricultural committees and borough war food societies have been organized extensively for the assistance of farmers and to secure further allotments of land for cultivation.

Attention has been turned to the utilization of land not ordinarily employed in agriculture, such as private parks, golf links, pleasure grounds, etc., as well as bringing more land into cultivated crops, employment of waste woodland for raising pigs, etc.

The farmers have been urged to plow up the poorer of the permanent pastures, shorten the period of grass and clover rotations, bring the remaining grass into the highest stage of production to enable it to carry more stock, reduce the acreage of bare fallow, and to cultivate more extensively crops for food and for animals.

The labor problem has been a difficult one in all the countries. In Great Britain persons employed in certain agricultural occupations have been exempted from military duty, but despite this, it is estimated that up to the middle of 1916, 320,000 men had been taken from the land. Special efforts have been made to secure labor at critical times, as during harvest, by a national volunteer movement, and women have been drawn into agricultural occupations as never before. In this they have shown marked adaptability and brought much favorable commendation on their services.

The various measures in aid of agriculture have presented fine examples of cooperation between national, state and local agencies. There has been cooperation between the civil and military branches, supported by a realization of the necessities of each, and between governmental and private organizations, often formed voluntarily for the purpose. The strength which this union of effort has given has enabled agriculture to maintain itself under most trying conditions.

But the measures for maintaining the food supply and other necessities have not stopped with the physical means of production. They have extended to advice and direction on the side of better farming, the conservation of supplies, and the utilization of new sources. The effort has tested ingenuity and resourcefulness to an unusual degree, and in this direction has led to new demands upon the various classes of agricultural institutions.

The war has gone a long way to impress upon governments and the public generally the vital position which production occupies and the advantages of the new agriculture. The supreme importance of scientific research in all branches has been impressed upon the countries of Europe by the most remarkable demonstrations ever furnished. In these demonstrations and convictions the indispensableness of science to an adequate agriculture has been given a new understanding, and in the general results the institutions and working forces charged with the prosecution of science and education in agriculture have richly shared.

Sidelights

Continuous Mortgage.

A motorist says: "I mortgaged my house to buy my automobile. Then I mortgaged my automobile to build a garage. Now I have mortgaged my garage to buy gasoline."

The Hired Man.

"Si Hubbard told me that he got a heap of work out of you when you was workin' fer him," said the farmer.

"Well, I allow he did," said the hired man.

"Yas. Fact is, I guess he jist about got it all."—Boston Transcript.

A Large Bedroom.

Easterner (after first day's work on a big western ranch)—Will you please show me where I can sleep tonight?

Rancher—Where you can sleep? Great Scott, man, here are 10,000 acres; jest pick out any blame spot that suits you and go to it.—New York Times.

A Parting Shot.

"But couldn't you learn to love me, Stella?" he pleaded.

"I don't think I could, Frank," she replied.

He stood erect, then quickly reached for his hat. "It is as I feared—you are too old to learn."—Everybody's Magazine.

Danger in Sight.

The cat settled himself luxuriously in front of the kitchen range and began to purr. Little Dolly, who was strange to the ways of cats, regarded her with horror.

"O gran'ma, gran'ma!" she cried. "Come here quick. The cat's begun to boil."—Christian Register.

Definite.

Stranger—How many machines pass here a day?

Farmer—I couldn't tell ye, exactly, sir!

Tourist——Oh, about how many?

Farmer—It all depends.

Tourist—Well, on the average?

Farmer—Wal, stranger, the average varies.

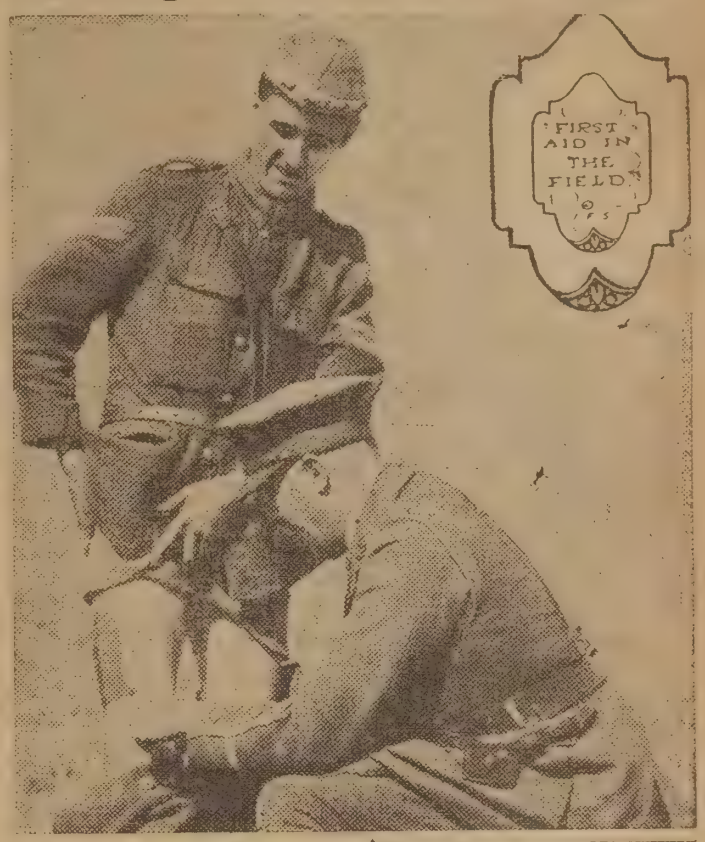
For the Needy.

The pastor announced that the collection of the day would be for the poor. The plate was passed to a man known to have plenty, but known also to be inclined to keep it. He did not contribute. The collector came around to him again. Again he did not contribute. Again, after a little, the plate was brought back. The rich man looked up at the collector and said: "Pass it on; I can't afford to give anything today."

"That's all right," replied the collector, still holding the plate before him. "Take out some. Didn't you hear the pastor say it was for the poor?"

All the World's a Stage, and All the Men and Women Merely Players

First Woman Dog Catcher



Milwaukee's latest municipal "wrinkle" is a woman dog catcher. Miss Ella Cawker has received official appointment to the position. She is the only woman dog catcher in the United States, it is said.

Late Admiral Dewey.

Admiral George Dewey, the nation's Spanish war hero, and by priority of grade the ranking naval officer of the world, died at his home in Washington, D. C., January 16, in his 80th year. A general breakdown was the cause of death.

Dressing a Wound in the Trenches

Unless an opportunity presents itself, the slightly wounded are not attended to at all while an engagement is taking place. The soldier shown in the picture, however, has been injured in a mild skirmish and is having his hurts cared for right on the scene.

Russia's New Premier.

Prince Golitzine, a member of the extremely conservative group in Russian politics, has succeeded General Trepoff as premier of Russia.

Niece of Carranza.

"The situation in Mexico is similar to that in Poland just before its fall—nobles and peans, with no backbone in the middle to hold them together."

This is the statement of Miss Oralia Carranza, a niece of General Venustiano Carranza, provisional president of Mexico. Miss Carranza thinks that what Mexico needs most just now is an extensive public school system which will produce a middle class, thus furnishing the backbone to hold the peons and nobles in contact. Miss Carranza is very anxious that Americans shall not believe all of her countrymen are bandits, and points out that Mexico City, Vera Cruz and other cities of her country have very much the same sort of social life that we have in any of our cities and towns. Miss Carranza has completed her education here and soon will return to Mexico.

Making Ready for an Offensive

Copyrighted by International Film Service.

Preparing artillery, even though it be of light caliber, for an extensive attack is no small job. Here artillerymen are seen preparing the position for an artillery offensive against the German forces on the western front.

Belgian Infantry Taking a Hike

Copyrighted by International Film Service.

The opening of dikes and the flooding of the lowlands made it impossible for the Germans to move their lines close to the Belgians and the only actions in which the Belgians now take part are artillery bombardments, long marches and frequent maneuvering to keep in training. This picture shows a detachment of Belgian infantry on a hike.

On His Way, Where?

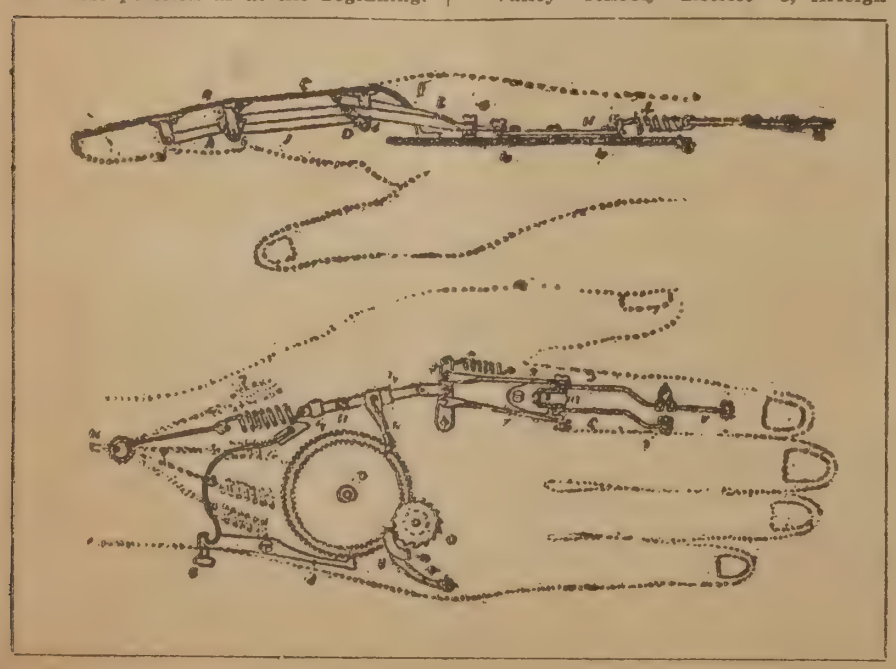
Invents Artificial Hand

Performs Many Functions of a Real, Live Member

An artificial hand that may be a formidable competitor for the large prize offered by the French government—unless the fact that its inventor was financed by the German museum at Zurich, Switzerland, makes it ineligible—has just been invented. It was made by a M. Will, who has succeeded in producing a substitute that will perform a really remarkable number of the actions of a real living hand.



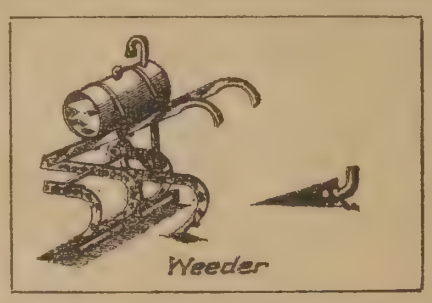
The chief duty of a hand is to grasp, This artificial hand grasps, and does it with the arm in any position. To make it ungrasp, open, let go, the wearer has only to press it upon a table or to press his upper arm against his body.

Each finger is composed of three joints, like the natural hand. The joints are connected with each other and to the palm of the hand by hinges. In the nail joint a lever (A) moves about a point of rotation (a). This lever terminates in the second joint in an angular piece (B), which turns on the point of rotation (b) and is operated by the lever (C), which in turn is extended into the third joint as far as the angular piece (D), moving around (d) by means of the levers (E), (F) and (G) and the guide (H). The guide (H) is placed in the bearings (h1) and (h2), attached to the back of the hand. This arrangement allows of the movement of the first joint. Arranged parallel to this transmission there is a second transmission which operates the middle joint. At the lower end of this and moving around the pivot (i) is attached the movable lever (J), which, like the lever (C), terminates in the angular piece (D). The lever (K) affects the movement of the third joint. This lever is joined to the guide (H) by means of the levers (F) and (C). By applying the arms of the levers of various lengths to the angular pieces (B) and (D), the closing of the hand is effected gradually, as in the case of the natural hand.

There is one of these arrangements for each finger. In order to simplify the diagrams the apparatus of only one finger is here shown.

On the guide (H) there is a spring (L) which is attached to a wire (M). The wire is connected by means of a little bracelet to the upper arm, just a little above the elbow. The guide (H) carries a click (N), which engages in a movable ratchet (O). A detent (P) holds the ratchet meshes with a lever wheel (Q) engaging with lever (R). When the wire (M) is pulled the movement is communicated to the spring (L) and then to the system of levers about the object to be grasped, while the click (N) passes over the ratchet (O) and when the pull ceases it engages in one of the teeth of the ratchet. The detent (P) ensures the maintenance of the [illegible] and at the same time releases the spring (L) from all draft or pressure. Upon pressing the button (S) the detent (P) is disengaged from the ratchet, which is then set free and can yield to the force exercised by the spring (T) on the lever (F). In this way the system of levers returns to the same position as at the beginning. In other words, the finger stretches out and the lever stop (R) prevents the finger from opening quickly, causing a gradual motion like that of the natural hand.

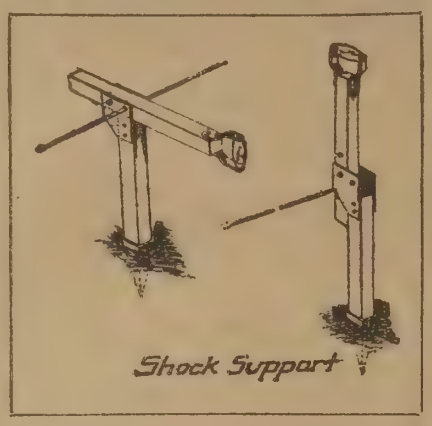
The number of movements may be extended considerably by varying the form of the teeth in the ratchet. The hand may be closed entirely, permitting the carrying of anything, the thumb pressing against the index finger. The interior surfaces of the fingers in the hand are provided with an elastic padding, allowing objects to be grasped gently.



Inventions

By C. J. LYNDE, Macdonald College, Quebec.

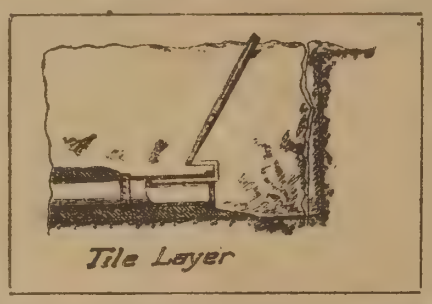
Weed Cutter and Sprayer.



The new feature of this weeder is that the surface blade has a sprayer

attachment which discharges liquid beneath the surface of the ground to kill objectionable plants and larvae. The device can be attached to an ordinary cultivator.

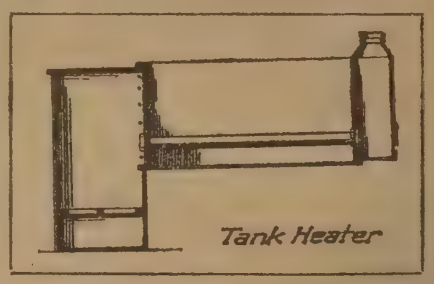
Shock Support.



The support is set up where a shock is to be formed The corn is piled around

it and bound, then the rod is pulled out and the support is removed to the position for the next shock.

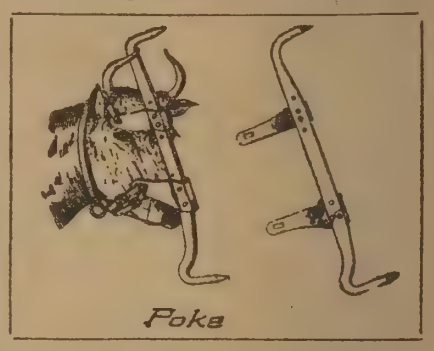
Tile Layer.



The title hook shown here is fastened

adjustably to the long handle by means of a bolt and thumb nut. It enables a man to lay drain tile without getting into the trench.

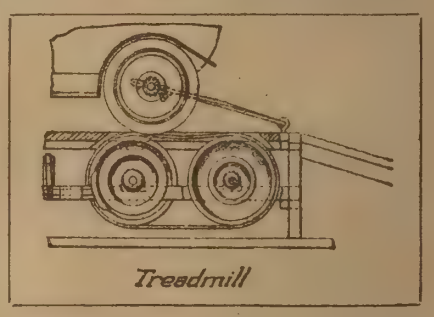
Tank Heater.



The water in this tank is heated by means of flues which pass through the tank from the furnace, on the left, to

the smoke box, on the right. The idea is to prevent the water from freezing in very cold weather.

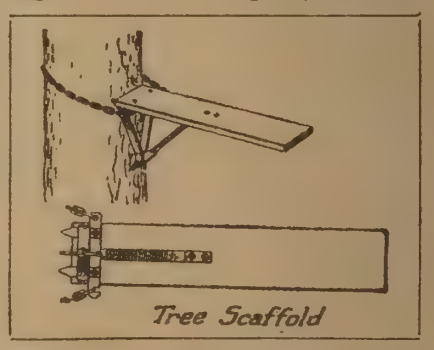
Animal Poke.



The advantages claimed for this poke are that it prevents a cow from going through, over or under a fence, and from eating stacked fodder, also that

it prevents a calf from sucking its mother. It consists of two hooked bars pivoted in front of the nose and attached by straps.

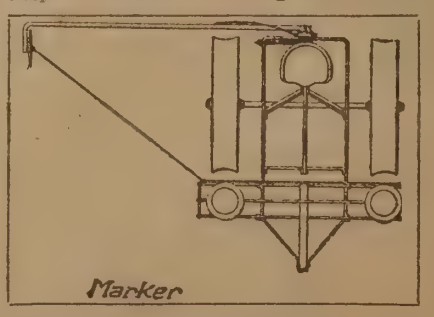
Automobile Tread Mill.



Each rear wheel of the car here rests on a belt just behind the forward pulley, and the power, used to drive other

machines, is taken from the axle of one pair of pulleys. The car is held stationary by a brace in the rear.

Tree Scaffold.



The object of this invention is to provide a scaffold to be used in felling trees. The chopper drives the spurs into the tree, with the board at an angle of about 45 degrees, and then

fastens the chains about the tree. His weight on the board drives the spurs farther into the tree and thus makes the scaffold secure.

Marker for Planters.

The special feature of this invention is a spring mechanism which helps the driver to swing the marker

from one side to the other. It is placed at the rear of the planter frame above the marker pivot.

The schools of Stevens county, Wash., are beginning to recognize the value of our free school library offer. Much of this interest is due to the indorsement of the plan by the County School Superintendent Elizabeth Stannard, who is untiring in her efforts to secure for each school in the county additional advantages.

Six more schools in this county have organized Red and Blue library teams for the purpose of obtaining books through our offer:

Union Flat school, district 40, Hazel A. Durham, teacher, 31 pupils.

Old Dominion school, district 137, Myrtle Donley, teacher, 37 pupils.

Lake school, district 4, Sudie L. Lee, teacher, 22 pupils.

Chewelah grade, district 22, A. D. Plum, principal, 35 pupils.

Chewelah grade, district 22, Muriel E. Sherwood, teacher, 38 pupils.

Valley school, district 3, Arleigh Hough, superintendent, 30 pupils.

Narcisse school, district 58, Daisy Lorenz, teacher, has been working for some time with a royal good will and have their library partially secured. But a little more help from friends and neighbors will be needed to complete their campaign. With the spirit they are working in they will get this, we are sure.

V. I. Tucker, Principal, Bossburg school, district 52, tells us that his pupils are enjoying their library of 25 books very much since they were obtained through our plan. Other teachers in that vicinity are interested and have made inquiries of him concerning our offer.

White Swan school, district88, Yakima county, C. A. Payne, principal, 45 pupils, organizes for a contest. Other schools already working in this county are reporting fine success.

Parents in each district of the state should take a keen interest in aiding their schools to obtain some of these books. Our offer includes a list of 540 books, suitable for the needs of lower, intermediate and higher grades, from which to make selections. All books are neatly bound in cloth, printed in clear type on a fine quality of paper. These books are not only of benefit to the pupils, but to the home folks as well, as they have the advantage of reading them when brought into the home by their children. If your school has not already taken advantage of our offer, an inquiry from yourself or the teacher of your district will afford us an opportunity to forward you full information as to our free school library plan.

Honor List.

Marguerite Wall, Hazel Taylor, May Greiner (6), George Cox, Perry Tripp, Dorothy Browne (2), Sidney Bernier, Elsie Johnson, Elizabeth Fogelquist, Laurel Miller and Lucile Howard of Selah school, Selah, Wash., R. D. No. 2; Willie Hall, Narcisse school, Colville, Wash., and Wayne Lewis and Howard Garber of River school, Almira, Wash.

WHEN KNIGHTHOOD WAS IN FLOWER

or, the Love Story of Charles Brandon and Mary Tudor, the King's Sister, and Happening in the Reign of His August Majesty, King Henry the Eighth.

BY EDWIN CASKODEN

Copyright, 1898, The Bobbs-Merrill Co.

SYNOPSIS.

Charles Brandon, who has neither wealth nor title, wins distinction for having defeated the heretofore unconquerable duelist, Judson. Brandon is installed as one of the captains of the guard of King Henry VIII. Edwin Caskoden (who tells the story) is Master of the Dance at London Court. The two young men become fast friends. Edwin tells Brandon of the willful, but adorable Mary Tudor, who had coaxed her royal brother Henry out of many proposed marriages which had been arranged for Henry's advantage. Edwin confesses that he, like scores of other men, had fallen in love with Mary, but upon Mary's refusal to marry him, he immediately became attracted to the good and beautiful Lady Jane Bolingbroke. He predicts that Brandon will soon fall a victim to Mary's charms.

CHAPTER III.—(Continued.)

Now, when Mary returned the whole court rejoiced, and I was anixious for Brandon to meet her and that they should become friends. There would be no trouble in bringing this meeting about, since, as you know, I was upon terms of intimate friendship with Mary and was the avowed, and, as I thought, at least hoped, all but accepted lover of her first lady in waiting and dearest friend, Lady Jane Bolingbroke. Brandon, it is true, was not noble; not even an English knight, while I was both knighted and noble; but he was of as old a family as England boasted, and near of kin to some of the best blood of the land. The meeting came about sooner than I expected, and was very near a failure. It was on the second morning after Mary's arrival at Greenwich. Brandon and I were walking in the palace park when we met Jane, and I took the opportunity to make these, my two best-loved friends, acquainted.

"How do you do, Master Brandon?" said Lady Jane, holding out her plump little hand, so white and soft, and dear to me. "I have heard something of you the last day or so from Sir Edwin, but had begun to fear he was not going to give me the pleasure of knowing you. I hope I may see you often now, and that I may present you to my mistress."

With this, her eyes, bright as overgrown dewdrops, twinkled with a mischievous little smile, as if to say: "Ah, another large, handsome fellow to make a fool of himself."

Brandon acquiesced in the wish she had made, and, after the interchange of a few words, Jane said her mistress was waiting at the other side of the grounds, and that she must go. She then ran off with a laugh and a courtesy, and was soon lost to sight behind the shrubbery at the turning of the walk.

In a short time we came to a summer house near the marble boat-landing, where he found the queen and some of her ladies awaiting the rest of their party for a trip down the river, which had been planned the day before. Brandon was known to the queen and several of the ladies, although he had not been formally presented at an audience. Many of the king's friends enjoyed a considerable intimacy with the whole court without ever receiving the public stamp of recognition socially, which goes with a formal presentation.

The queen, seeing us, sent me off to bring the king. After I had gone, she asked if any one had seen the Princess Mary, and Brandon told her Lady Jane had said she was at the other side of the grounds. Thereupon her majesty asked Brandon to find the princess and to say that she was wanted.

Brandon started off and soon found a bevy of girls sitting on some benches under a spreading oak, weaving spring flowers. He had never seen the princess, so could not positively know her. As a matter of fact, he did know her, as soon as his eyes rested on her, for she could not be mistaken among a thousand—there was no one like her or anything near it. Some stubborn spirit of opposition, however, prompted him to pretend ignorance. All that he had heard of her wonderful power over men, and the servile manner in which they fell before her, had aroused in him a spirit of antagonism, and had begotten a kind of distaste beforehand. He was wrong in this, because Mary was not a coquette in any sense of the word, and did absolutely nothing to attract men, except to be so beautiful, sweet and winning that they could not let her alone; for all of which surely the prince of fault-finders himself could in no way blame her.

She could not help it that God had seen fit to make her the fairest being on earth, and the responsibility would have to lie where it belonged—with God; Mary would have none of it. Her attractiveness was not a matter of volition or intention on her part. She was too young for deliberate snare-setting—though it often begins very early in life—and made no effort to attract men. Man's love was too cheap a thing for her to strive for, and I am sure, in her heart, she would infinitely have prefered to live without it—that is, until the right one should come. The right one is always on his way, and, first or last, is sure to come to every woman—sometimes, alas! too late—and when he comes, be it late or early, she crowns him, even though he be a long-eared ass. Blessed crown! and thrice-blessed blindness—else there were fewer coronations.

So Brandon stirred this antagonism and determined not to see her manifold perfections, which he felt sure were exaggerated; but to treat her as he would treat the queen—who was black and leathery enough to frighten a satyr—with all respect due to her rank, but with his own opinion of her, nevertheless, safely stored away in the back of his head.

Coming up to the group, Brandon took off his hat, and, with a graceful little bow that let the curls fall around his face, asked: "Have I the honor to find the Princess Mary among these ladies?"

Mary, whom I know you will at once say was thoroughly spoiled, without turning her face toward him, replied: "Is the Princess Mary a person of so little consequence about the court that she is not known to a mighty captain of the guard?"

He wore his guardsman's doublet, and she knew his rank by his uniform. She had not noticed his face.

Quick as a flash came the answer: "I can not say of what consequence the Princess Mary is about the court; it is not my place to determine such matters. I am sure, however, she is not here, for I doubt not she would have given a gentle answer to a message from the queen. I will continue my search." With this, he turned to leave, and the ladies, including Jane, who was there and saw it all and told me of it, awaited the bolt they knew would come, for they saw the lightning gathering in Mary's eyes.

Mary sprang to her feet with an angry flush in her face, exclaiming, "Insolent fellow, I am Princess Mary; if you have a message, deliver it and be gone." You may be sure this sort of treatment was such as the cool-headed, daring Brandon would repay with usury; so, turning upon his heel, and almost presenting his back to Mary, he spoke to Lady Jane:

"Will your ladyship say to her highness that her majesty, the queen, awaits her coming at the marble landing?"

"No need to repeat the message, Jane," cried Mary; "I have ears and can hear for myself." Then turning to Brandon: "If your insolence will permit you to receive a message from so insignificant a person as the king's sister, I beg you to say to the queen that I will be with her presently."

He did not turn his face toward Mary, but bowed again to Jane.

"May I ask your ladyship further to say for me that if I have been guilty of any discourtesy I greatly regret it. My failure to recognize the Princess Mary grew out of my misfortune in never having been allowed to bask in the light of her countenance. I can not believe the fault lies at my door, and hope for her own sake that her highness, upon second thought, will realize how ungentle and unkind some one has been." And with a sweeping courtesy he walked quickly down the path.

"The insolent wretch!" cried one.

"He ought to hold papers on the pillory," said another.

"Nothing of the sort,' broke in sensible, fearless little Jane; "I think the Lady Mary was wrong. He could not have known her by inspiration."

"Jane is right," exclaimed Mary, whose temper, if short, was also short-lived, and whose kindly heart always set her right if she but gave it a little time. Her faults were rather those of education than of nature. "Jane is right; it was what I deserved. I did not think when I spoke, and did not really mean it as it sounded. He acted like a man, and looked like one, too, when he defended himself. I warrant the pope at Rome could not run over him with impunity. For once I have found a real live man, full of manliness. I saw him in the lists at the Windsor a week ago, but the king said his name was a secret, and I could not learn it. He seemed to know you, Jane. Who is he? Now tell us all you know. The queen can wait."

And her majesty waited on a girls' curiosity.

I had told Jane all I knew about Brandon, so she was prepared, with full information, and gave it. She told the princess who he was; of his terrible duel with Judson; his bravery and adventures in the wars; his generous gift to his brother and sisters, and lastly, "Sir Edwin says he is the best-read man in the court, and the bravest, truest heart in Christendom."

After Jane's account of Brandon, they all started by a roundabout way for the marble landing. In a few moments whom did they see, coming toward them down the path, but Brandon, who had delivered his message and continued his walk. When he saw whom he was about to meet, he quietly turned in another direction. The Lady Mary had seen him, however, and told Jane to run forward and bring him to her. She soon overtook him and said:

"Master Brandon, the princess wishes to see you." Then, maliciously, "You will suffer this time. I assure you she is not used to such treatment. It was glorious, though, to see you resent such an affront. Men usually smirk and smile foolishly and thank her when she smites them."

Brandon was disinclined to return.

"I am not in her highness' command," he answered, "and do not care to go back for a reprimand when I am in no way to blame."

"Oh, but you must come; perhaps she will not scold this time," and she put her hand upon his arm, and laughingly drew him along. Brandon, of course, had to submit when led by so sweet a captor—anybody would. So fresh and fair, and lovable was Jane, that I am sure anything masculine must have given way.

Coming up to the princess and her ladies, who were waiting, Jane said, "Lady Mary, let me present Master Brandon, who, if he has offended in any way, humbly sues for pardon." That was the one thing Brandon had no notion on earth of doing, but he let it go as Jane had put it, and this was his reward:

"It is not Master Brandon who should sue for pardon," responded the princess, "it is I who was wrong. I blush for what I did and said. Forgive me, sir, and let us start anew." At this she stepped up to Brandon and offered him her hand, which he, dropping to his knee, kissed most gallantly.

"Your highness, you can well afford to offend when you have so sweet and gracious a talent for making amends; 'A wrong acknowledged,' as some one has said, becomes an obligation.'" He looked straight into the girl's eyes as he said this, and his gaze was altogether too strong for her, so the lashes fell. She flushed and said with a smile that brought the dimples:

"I thank you; that is a real compliment." Then laughingly: "Much better than extravagant comments on one's skin, and eyes, and hair. We are going to the queen at the marble landing; will you walk with us, sir?" And they strolled away together, while the other girls followed in a whispering, laughing group.

Was there ever so glorious a calm after such a storm?

"Then those mythological compliments," continued Mary, "don't you dislike them?"

"I cant' say that I have ever received many—none that I recall," replied Brandon, with a perfectly straight face, but with a smile trying its best to break out.

"Oh! you have not? Well! how would you like to have somebody always telling you that Apollo was humpbacked and misshapen compared with you; that Endymion would have covered his face had he but seen yours, and so on?"

"I don't know, but I think I should like it—from some persons," he replied, looking ever so innocent.

This savored of familiarity after so brief an acquanintance, and caused the princess to glance up in slight surprise; but only for the instant, for his innocent look disarmed her.

"I have a mind to see," she returned, laughing and throwing her head back, as she looked up at him out of the corner of her lustrous eyes. But I will pay you a better compliment. I positively thank you for the rebuke. I do many things like that, for which I am always sorry. Oh! you don't know how difficult it is to be a good princess." And she shook her head, with a gathering of little trouble-wrinkles in her forehead, as much as to say, "There is no getting away from it, though." Then she breathed a soft little sigh of tribulation as they walked on.

"I know it must be a task to be good when everybody flatters even one's shortcomings," said Brandon, and then continued in a way that, I am free to confess, was something priggish. "It is almost impossible for us to see our own faults, even when others are kind enough to point them out, for they are right ugly things and unpleasant to look upon. But lacking those outside monitors, one must all the more cultivate the habit of constant inlooking and self-examination. If we are only brave enough to confront our faults and look them in the face, ugly as they are, we shall be sure to overcome the worst of them. A striving toward good will achieve at least a part of it."

"Oh!" returned the princess, "but what is good and what is wrong? So often we can not tell them apart until we look back at what we have done, and then it is all too late. I truly wish to be good more than I desire anything else in the world. I am so ignorant and helpless, and have such strong inclinations to do wrong that sometimes I seem to be almost all wrong. The priests say so much, but tell us so little. They talk about St. Peter and St. Paul, and a host of other saints and holy fathers and what nots, but fail to tell us what we need every moment of our lives; that is, how to know the right when we see it, and how to do it; and how to know the wrong and how avoid it. They ask us to believe so much, and insist that faith is the sum of virtue, and the lack of it the sum of sin; that to faith all things are added; but we might believe every syllable of their whole disturbing creed, and then spoil it, all through blind ignorance of what is right and what is wrong.

"'As to knowing right and wrong," replied Brandon, "I think I can give you a rule which, although it may not cover the whole ground, is excellent for everyday use. It is this: Whatever makes others unhappy is wrong; whatever makes the world happier is good. As to how we are always to do this, I can not tell you. One has to learn that by trying. We can but try, and if we fail altogether, there is still virtue in even futile effort along the right."

Mary bent her head as she walked along in thought.

"What you have said is the only approach to a rule for knowing and doing the right, I have ever heard. (Now what do you think of me as a flatterer?) But it will do no good; the bad is in me too strong; it always does itself before I can apply any rule, or even realize what is coming." And again she shook her head with a bewitching little look of trouble.

"Pardon me, your highness; but there is no bad in you. It has been put on you by others, and is all on the outside; there is none of it in your heart at all. That evil which you think comes out of you, simply falls off you; your heart is all right, or I have greatly misjudged you." He was treating her almost as if she were a child.

"I fear, Master Brandon, you are the most adroit flatterer of all," said Mary, shaking her head and looking up at him with a side glance, "people have deluged me with all kinds of flattery—I have the different sorts listed and labeled—but no one has ever gone to the extravagant length of calling me good. Perhaps they think I do not care for that; but I like it best. I don't like the others at all. If I am beautiful or not, it is as God made me, and I have nothing to do with it, and desire no credit, but if I could only be good it might be my own doing, perhaps, and I ought to have praise. I wonder if there is really and truly any good in me, and if you have

(Continued on following page.)

When Knighthood Was in Flower

BY EDWIN CASKODEN

(Continued from preceding page.)

read me aright." Then looking up at him with a touch of consternation: "Or are you laughing at me?"

Brandon wisely let the last suggestion pass unnoticed.

"I am sure that I am right; you have glorious capacities for good, but alas! corresponding possibilities for evil. It will eventually depend upon the man you marry. He can make out of you a perfect woman, or the reverse." Again there was the surprised expression in Mary's face, but Brandon's serious look disarmed her.

"I fear you are right, as to the reverse, at any rate; and the worst of it is, I shall never be able to choose a man to help me, but shall sooner or later be compelled to marry the creature who will pay the greatest price."

"God forbid!" said Brandon reverently.

They were growing rather serious, so Mary turned the conversation again into the laughing mood, and said, with a half sigh: "Oh! I hope you are right about the possibilities for good, but you do not know. Wait until you have seen more of me."

"I certainly hope I shall not have long to wait."

The surprised eyes again glanced quickly up to the serious face, but the answer came: "That you shall not;—but here is the queen, and I suppose we must have the benediction." Brandon understood her hint—that the preaching was over—and taking it for his dismissal, playfully lifted his hands in imitation of the old bishop of Canterbury and murmured the first line of the Latin benediction. Then they both laughed and courtesied, and Brandon walked away.

CHAPTER IV.

I laughed heartily when Jane told me of the tilt between Brandon and Princess Mary, the latter of whom was in the habit of saying unkind things and being thanked for them.

Brandon was the wrong man to say them to, as Mary learned. He was not hot-tempered; in fact, just the reverse, but he was the last man to brook an affront, and the quickest to resent, in a cool-headed, dangerous way, an intentional offense.

He respected himself and made others do the same, or seem to do so, at least. He had no vanity—which is but an inordinate desire for those qualities that bring self-respect, and often the result of conscious demerit—but he knew himself, and knew that he was entitled to his own good opinion. He was every inch a man, strong, intelligent and brave to temerity, with a reckless disregard of consequences, which might have been dangerous had it not been tempered by a dash of prudence and caution that gave him ballast.

I was not surprised when I heard of the encounter: for I knew enough of him to be sure that Mary's high-handedness would meet its counterpart in my cool friend Brandon. It was, however, an unfortunate victory, and what all Mary's beauty and brightness would have failed to do, her honest, open acknowledgment of wrong, following so quickly upon the heels of her fault, accomplished easily. It drew him within the circle of her fatal attractions, and when Jane told me of it, I knew his fate was sealed, and that, sooner or later, his untouched heart and cool head would fall victim to the shafts that so surely winged all others.

It might, and probably would be, "later," since, as Brandon had said, he was not one of those who wore his heart upon his sleeve. Then he had that strong vein of prudence and caution, which, in view of Mary's unattainableness, would probably come to his help. But never was man's heart strong enough to resist Mary Tudor's smile for long.

There was this difference between Brandon and most others; he would be slow to love, but when love should once fairly take root in his intense nature, he would not do to trifle with.

That night after the meeting Mary cuddled up to Jane, who slept with her, and whispered, half bashfully:

"Tell me all about Brandon; I am interested in him. I believe if I knew more persons like him I should be a better girl, notwithstanding he is one of the boldest men I ever knew. He says anything he wishes and, with all his modest manner, is as cool with me as if I were a burgher's daughter. His modesty is all on the outside, but it is pretty, and pretty things must be on the outside to be useful. I wonder if Judson thought him modest?"

Jane talked of Brandon to Mary, who was in an excellent humor, until the girls fell asleep.

When Jane told me of this I became frightened; for the surest way to any woman's heart is to convince her that you make her better, and arouse in her breast purer impulses and higher aspirations. It would be bad enough should Brandon fall in love with the princess, which was almost sure to happen, but for them to fall in love with each other meant Brandon's head upon the block, and Mary's heart ruined, broken and empty for life. Her strong nature, filled to the brim with latent passion, was the stuff of which love makes a conflagration that burns to destruction; and should she learn to love Brandon, she would move heaven and earth to possess him.

She whose every desire from childhood up had been gratified, whose every whim seemed to her a paramount necessity, would stop at nothing when the dearest wish a woman's heart can coin was to be gained or lost. Brandon's element of prudence might help him, and might forestall any effort on his part to win her, but Mary had never heard of prudence, and man's caution avails but little when set against woman's daring. In case they both should love, they were sure to try for each other, and in trying were equally sure to find ruin and desolation.

A few evenings after this I met the princess in the queen's drawing room. She beckoned me to her and, resting her elbows on the top of a cabinet, her chin in her hands, said: "I met your friend, Captain Brandon, a day or two ago. Did he tell you?"

'No," I answered; "Jane told me, but he has not mentioned it."

It was true Brandon had not said a word of the matter, and I had not spoken of it, either. I wanted to see how long he would remain silent concerning an adventure that would have set most men of the court boasting away at a great rate. To have a tilt with the ever-victorious Mary, and to come off victor, was enough, I think, to loosen any tongue less given to bragging than Brandon's.

"So," continued Mary, evidently somewhat piqued, "he did not think his presentation to me a thing worth mentioning? We had a little passage-at-arms, and, to tell you the truth, I came off second best, and had to acknowledge it, too. Now what do you think of this new friend of yours? And he did not boast about having the better of me? After all there is more virtue in his silence than I at first thought." And she drew back her head, and clapped her hands and laughed with the most contagious little ripple you ever heard. She seemed not to grieve over her defeat, but dimpled as though it were a huge joke, the thought of which rather pleased her than otherwise. Victory had grown stale for her, although so young.

"What do I think of my new friend?" I repeated after her, and that gave me a theme upon which I could enlarge eloquently. I told her of his learning, nothwithstanding the fact that he had been in the continental wars ever since he was a boy. I repeated to her stories of his daring and bravery, that had been told to me by his uncle, the master of the horse, and others, and then I added what I knew Lady Jane had already said. I had expected to be brief, but to my surprise found a close and interested listener, even to the twice-told parts, and drew my story out a little, to the liking of us both.

"Your friend has an earnest advocate in you, Sir Edwin," said the princess.

"That he has," I replied. "There is nothing too good to say of him."

I knew that Mary, with her better, clearer brain, held the king almost in the palm of her hand, so I thought to advance Brandon's fortune by a timely word.

"I trust the king will see fit to favor him, and hope that you will speak a word in his behalf should the opportunity occur."

"What in the name of heaven have we to give him?" cried Mary, impatiently, for she kept an eye on things political, even if she were only a girl—"the king has given away everything that can be given, already, and now that the war is over and men are coming home there are hundreds waiting for more. My father's great treasure is squandered, to say nothing of the money collected from Empson, Dudley and the other commissioners. There is nothing to give unless it be the titles and estate of the late duke of Suffolk. Perhaps the king will give these to your paragon if you will paint him in as fair a light as you have drawn him for me." Then throwing back her head with a laugh, "Ask him."

"It would be none too much for his deserts," I replied, falling in with her humor.

"We will so arrange it then," went on Mary banteringly; "Captain Brandon no longer, but Charles Brandon, duke of Suffolk. How sounds it Master Caskoden?"

"Sweet in my ears," I replied.

"I really believe you would have the king's crown for him, you absurd man, if you could get it. We must have so interesting a person at court; I shall at least see that he is presented to the queen at once. I wonder if he dances. I suppose not. He has probably been too busy cutting and thrusting." And she laughed again at her own pleasantry.

When the mirth began to gather in her face and the dimples came responsive to her smiles; when she threw back her perfectly poised head, stretching her soft, white throat, so full and round and beautiful, half closing her big brown eyes till they shone again from beneath the shade of those long, black sweeping lashes; when her red lips parted, showing her teeth of pearl, and she gave the little clap of her hands—a sort of climax to the soft, low, rippling laugh—she made a picture of such exquisite loveliness that it is no wonder men were fools about her, and caught love as one catches a contagion. I had it once, as you already know, and had recovered. All that prevented a daily relapse was my fair sweet antidote, Jane, whose image rested in my heart, a lasting safeguard.

"I wonder if your prodigy plays cards; that is, such as we ladies play?" asked Mary. "You say he has lived much in France, where the game was invented, but I have no doubt he would scorn to waste his time at so frivolous a pursuit, when he might be slaughtering armies single-handed and alone."

"I do not know as to his dancing and card playing, but I dare venture a wager he does both," I replied, not liking her tone of sarcasm. She had yet to learn who Brandon was.

"I will hazard 10 crowns," said Mary quickly, for she loved a wager and was a born gambler.

"Taken," said I.

"We will try him on both tomorrow night in my drawing room," she continued. "You bring him up, but tell no one. I will have Jane there with her lute, which will not frighten you away I know, and we will try his step. I will have cards, too, and we shall see what he can do at triumph. Just we four—no one else at all. You and Jane, the new duke of Suffolk and I. Oh! I can hardly wait," and she fairly danced with joyous anticipation.

The thing had enough irregularity to give it zest, for while Mary often had a few young people in her drawing room the companies were never so small as two couples only, and the king and queen, to make up for greater faults, were wonderful sticklers in the matter of little proprieties.

The ten-crown wager, too, gave spice to it, but to do her justice she cared very little for that. The princess loved gambling purely for gambling's sake, and with her, the next best thing to winning was losing.

When I went to my room last night, I awakened Brandon and told him of the distinguished honor that waited him.

"Well! I'll be"— but he did not say what he would "be." He always halted before an oath, unless angry, which was seldom, but then beware!—he had learned to swear in Flanders. "How she did fly at me the other morning; I never was more surprised in all my life. For once I was almost caught with my guard down, and did not know how to parry the thrust. I mumbled over some sort of a lame retaliation and beat a retreat. It was so unjust and uncalled for that it made me angry; but she was so gracious in her amends that I was almost glad it happened. I like a woman who can be as savage as the very devil when it pleases her; she usually has in store an assortment of possibilities for the other extreme."

"She told me of your encounter," I returned, "but said she had come off second best, and seemed to think her overthrow a huge joke."

"The man who learns to know what a woman thinks and feels will have a great deal of valuable information," he replied; and then turned over for sleep, greatly pleased that one woman thought as she did.

I was not sure he would be so highly flattered if he knew that he had been invited to settle a wager, and to help Mary to a little sport.

As to the former, I had an interest there myself, although I dared not settle the question by asking Brandon if he played cards and danced; and, as to the matter of Mary's sport, I felt there was but little, if any, danger of her having too much of it at his expense, Brandon being well able to care for himself in that respect.

The next evening, at the appointed time, we wended our way, by an unfrequented route, and presented ourselves, as secretly as possible, at the drawing-room of the princess.

The door was opened by Lady Jane, and we met the two girls almost at the threshold. I had told Brandon of the bantering conversation about the title and estates of the late Duke of Suffolk, and he had laughed over it in the best of humor. If quick to retaliate for an intentional offense, he was not thin-skinned at a piece of pleasantry, and had none of that stiff, sensitive dignity, so troublesome to one's self and friends.

Now, Jane and Mary were always bantering me because I was short, and inclined to be—in fact—round, but I did not care. It made them laugh, and their laughing was so contagious, it made me laugh too, and we all enjoyed it. I would give a pound sterling any time for a good laugh: and that, I think, is why I have always been—round.

So, upon entering, I said:

"His Grace, the Duke of Suffolk, ladies."

They each made a sweeping courtesy, with hand on breast, and gravely saluted him:

"Your Grace, good even'."

Brandon's bow was as deep and graceful, if that were possible, as theirs, and when he moved on into the room it was with a little halt in his step, and a big blowing out of the cheeks, in ludicrous imitation of his late lamented predecessor, that sent

Acclimated Seed Wanted

Demand Can Be Reached Through Want Ads

Turn over to the "want" ad page of this issue and notice the seed classification.

Space in this department may be secured at a reasonable rate by those who are able to offer good, clean, acclimated seed.

These "want" ads will take your offer into more than 50,000 farm homes in the Pacific northwest. In a large proportion of these homes there is undoubtedly a demand for seed that has been tested out under the conditions and climate peculiar to this section.

We believe our seed classification will prove of real service both to those who have acclimated seed to sell and to those who want to buy and plant it.

If you have something in this line that you've tried out on your own place and know is good, let us hear from you.

Unlimited Value

Every One Should Have a Purpose

By ALICE W. BARLAND.

I would like to emphasize what I have before expressed, the almost unlimited value of a purpose in life and a definite plan for working it out. Every community has people who make a fairly good start in life, but some way fall short of making a success of their undertakings.

In nine times out of ten, if one could arrive at the cause of their failure it would be lack of purpose, the absence of a definite plan of action. Some men and women, too, seem satisfied to live along from week to week, from month to month, and year to year with no definite plan to follow.

The kind of people of whom I am speaking never own a home, or if they do they usually acquire it some way other than earning it.

These purposeless people sometimes start out to buy a home and pay along for a time, then lose sight of the purpose and allow their payments and ambition both to lapse. By and by old age comes upon them; they have not saved anything against the time when they are past the earning period and everywhere we see them, in the county poor houses, unwelcome members in the families of relatives or wandering about looking for odd jobs.

They have all had youth, most of them health, every one opportunity, but lacking a steadfast purpose and definite plan of action they have failed to "get there."

Perhaps these words will come under the attentions of some young people—I hope so—and if they have not already formed the habit of finishing up what they begin let me urge them to form such a habit. Let me urge you young folks if you start to read a book, really start, read it through; if you start to build a hen coop finish it down to the last slat, if you start to embroider a pair of pillow slips finish them.

Now don't misunderstand me, please, I do not wish to convey the idea that having commenced come piece of work one should let every other duty wait till such piece is finished. One should mix common sense very liberally into his daily routine. The thought I would leave with you is this: Decide what you want to do, or if you do not want to do it what, in the line of your duty, you should do, and then do it, cheerfully and contendedly, if possible, but do it, finish it.

Tea Basque.

Of Hague blue crepe meteor is this very graceful and practical addition to the feminine wardrobe. The sleeves are of black satin and all round the edges are hand-stitched patterns in black, lemon, yellow and blue wool. Indeed, its charm lies in the dainty hand work and in the border of acorn tassels, yellow and black. Yet other tea basques are of Persian satin, also black sleeved and of heavy white Chinese crepe, the wrinkles of which almost amount to a twill. This basque is delicately embroidered on its edges with spider web filaments of tarnished gold and pale green picked out with an occasional crystal drop.—Kansas City Star.

Lumber Consumption.

St. Louis has one factory which will this year consume 100,000,000 feet of lumber.

The Fatal Admission.

"He's a failure!" said his neighbor,
But he wasn't one, you bet!
For he started out to labor
As he'd never labored yet;
And he did his daily duty with a grim, determined smile—
For a fellow's not a failure who keeps busy all the while.

He's a failure!" said his fellows,
But he wasn't—not just yet—
Though he had a leaky bellows
And a staggering load of debt.
"He's a failure!" said his father.
"He's an ornery, yellow pup!"
But a fellow's not a failure if he hasn't given up!

"He's a failure!" sighed his mother,
"He's a failure!" sobbed his wife;
There was never friend or brother
Who could help him back to life.
Then he murmured "I'm a failure!"
But he wasn't—not a bit.
Till that fatal moment came when he himself acknowledged it!

—Cleveland Plain Dealer.

Hospitality

Old-time Family Life Passing

In our day we seem to see the passing of that delightful phase of the old-time family life called hospitality. Many of us, perhaps, have been all unmindful of its departure, but some familiar, clusive flavor of life seems lacking. Something wholesome and satisfying is gone, says a writer in the Women's Institute Quarterly of the British Columbia department of agriculture.

One cause of the decline of hospitality arises from the efforts of many misguided folk to transplant it from its natural place to the unfriendly soil of a club. They do not have company at their houses any more. "We invite them to a club instead," they say; "it is so much less bother." It may be less bother; the club may possess a score of advantages in appointments and service; but it must always come far short in one particular, which to right-minded people outweighs them all—it is not a home.

Where true hospitality exists, every one is at ease and therefore at his best. The timid find they can talk. Under the genial atmosphere they can even venture to be witty. In the practice of successful hospitality people are let alone. Most women fuss over their guests too much. If they choose to talk, very well; if they prefer to be silent, pray do not force them to talk. If they want to depart, allow them to go without those insistent efforts to detain which many think a manifestation of hospitality, but which are really a great bore.

A Formidable Obstacle.

One formidable obstacle in the way of exercising hospitality arises from a false notion that things are necessary; things to eat, things to look at—carpets, furniture, silver, glass. "I can't invite any one until I get a new dining-room rug." "Our parlor chairs are too shabby to have any company." "I should like to ask them, but am not strong enough to get up a big dinner." Hospitality not only does not depend upon these things, but it is something far removed from them. Indeed, its finest flavor is often found amid the plainest surroundings.

If one desires to make hospitality famous, it is not necessary to plan elaborate meals or conjure up novel dishes. When people are away where they dare to be honest and naturel, the majority will confess a fondness for plain, hearty food. If you have a longing to make your home a popular place and not knowing quite how to do it, can you not, by patience and intelligent effort, learn to make some one thing so well as to create a reputation for it? It does not matter in the least what it is—chicken pie, or salad, or baked beans, or lemon pie. Any woman can absolutely master one thing. This phase of the matter has been dwelt upon not because the pleasures of the table form the chief element of successful hospitality, but because, though a woman may put forth many other objections, her reluctance to establish a gracious open-door policy arises mainly from wrong notions and absurd standards as to what she shall give her friends to eat.

Family Skeletons' Nasty Habits.

Another necessity for true hospitality is a happy home. Family skeletons have such an unpleasant habit of not staying decently shut up in their closets. They will peer out through a crack in the door, or will boldly come forth and stalk through the rooms. Guests are not deceived by mere pretense of happiness. The most stupid can tell whether love reigns in the home or not. Husbands and wives at variance with each other, or coolly indifferent, may entertain elaborately and successfully, but true hospitality is found only in a happy home.

Hospitality does not weigh its guests by the world's faulty scales, but asserts its right to enjoy friends for their worth, or congeniality of taste, or learning, or wit, quite apart from any consideration of their garments or gold or luck.

It would be well if young people who are just establishing a home would consider seriously what kind it shall be. If it be their good fortune to be of one mind in longing to exercise hospitality of the highest type, let them study the homes that most closely approach their ideals—they may catch the secret.

Household Hints.

I saw such a convenient thing recently to hold the ball of string for use in the kitchen. It was a small tin funnel. One can hang it on a hook from the wall by the tin ring and place the ball of string inside with the end drawn through the small end. It can be painted white or any color and even if not painted, but left in its natural state it would be much less annoying than to hunt for string.

When the birthday cake is finished and frosted ready for the tiny candles, arrange marshmallows on the top while the frosting is still soft, as many as the candles you wish to use, and insert a candle into each marshmallow. They hold the candles better than any way I know of.

If you spill grease on the stove or into the oven, put salt over it, the more grease you have burning the more salt you should use. I saved my house from taking fire once when a tin of melted butter was burning at such a rate that the flames were reaching the ceiling and a table next the stove was blazing. I threw a gallon of salt on the grease and it subsided instantly.

Take my advice dear women and don't keep house without three or four asbestos mats. They are such a help and make one feel so safe to leave food cooking on the stove when called to some distant part of the house. The kind with wire on one side last the longest, but if water is never spilled on them any kind will last for years. Some ovens are so hot on the bottom that everything burns, and sometimes just one place is hot. I have found a piece of plain asbestos, without the wire or tin binding, very useful to slip under anything baking too hard on the bottom. A. W. B.

Buttermilk Bran Muffins.

Three-quarters pint buttermilk, two cups bran, one cup white flour, one teaspoonful salt, one teaspoonful soda, one quarter cup molasses, one-half cup of dates. Stir the bran and white flour into the buttermilk, add salt, soda, molasses and finely chopped dates, which have been thoroughly dredged with flour. Bake 45 minutes in greased muffin rings or gem pans. Dissolve soda in a tablespoonful of hot water. Time in preparation, 25 minutes. Number of persons served, six.

Concrete Widely Used.

Concrete is being used almost exclusively for the gate structures of irrigation canals in this country, displacing wood for the purpose, despite the greater cost of concrete.

Patterns

1470—Girls' Dresses: Cut in four sizes, 6, 8, 10 and 12 years. It requires three and three-fourths yards of 36-inch material for an 8-year size. Price, 10 cents.

1925—Girls' Slip: Cut in five sizes, 2, 4, 6, 8 and 10 years. It requires for size 6, two yards of 36-inch material. Price, 10 cents.

1928—Ladies' Skirt: Cut in seven sizes, 22, 24, 26, 28, 30, 32 and 34 inches waist measure. It requires five and

three-eighths yards of 27-inch material for a 24-inch size. The skirt measures about three and a quarter yards at its lower edge. Price, 10 cents.

1919—Ladies' Waist: Cut in seven sizes, 34, 36, 38, 40, 42, 44 and 46 inches bust measure. It requires two and three-fourths yards of 36-inch material for a 36-inch size. Price, 10 cents.

1923—Coat Dress for Misses and Small Women: Cut in four sizes, 14, 16, 18 and 20 years. It requires five and a half yards of 44-inch material for a 16-year size. The skirt measures about three yards at the lower edge. Price, 10 cents.

1937—Junior Dress: Cut in three sizes, 12, 14 and 16 years. It requires three and a quarter yards for the dress, and three yards for the over blouse, for a 14-year size, in 27-inch material. Price, 10 cents.

Nutritious Potato Bread

Palatable Food Product of Cull Potatoes

Excellent bread can be made by using 3 pounds of boiled and mashed potatoes and 2 1-4 pounds of good bread flour, according to the baking specialists of the U. S. department of agriculture. The bread so compounded has a rich, brown crust and tender and elastic crumb. It has an appetizing odor and a very agreeable taste, which is preferred by many to that of bread made wholly from flour. When made according to the directions given below, potato bread contains more mineral matter, fiber and moisture, but otherwise in composition and nutritive value is practically the same as ordinary bread. Its higher moisture content helps to keep it fresh several days longer than ordinary bread. In localities where there is a surplus of potatoes or where they are very cheap, potato bread costs less to make than all-flour bread, and, in general, is a good way in which to utilize cull potatoes in a palatable food product. Even, however, where the relative market prices of potatoes and flour are such that there is no economy in substituting potato for flour, the individual flavor and keeping quality of potato bread make it desirable as a variant in the family diet.

The following methods for making potato bread, worked out in the baking laboratory, are recommended:

Potato Bread—Straight Dough Method.

For four 1-pound loaves, the following ingredients are required:

3 pounds of boiled and peeled potatoes.
2¼ pounds of good bread flour.
3 level tablespoonfuls of sugar.
1½ level tablespoonfuls of salt.
2 cakes of compressed yeast.
4 tablespoonfuls of lukewarm water.

Wash thoroughly and boil in their skins about 12 potatoes of medium size. Cook them until they are very tender. Drain, peel, and mash them while hot, being careful to leave no lumps. Allow the mashed potato to cool in 86 degrees Fahreinheit, or until lukewarm. To 3 pounds (5 solidly packed 1-2-pint cupfuls) of the mashed potato, add the yeast, which has been rubbed smooth in a cup with 3 tablespoonfuls of lukewarm water. To get all the yeast, rinse the cup with the remaining tablespoonful of water and add this also to the potato. Next add the salt, the sugar, and about 4 ounces of the flour (1 scant half-pint of sifted flour. Mix thoroughly with the hand, but do not add any more water at this stage.

Cover the mixing bowl to avoid the formation of a crust on top and place out of the way of drafts to rise, where the temperature can not fall below 80 degrees Fahrenheit, or be much higher than 88 degrees Fahrenheit. Where the housewife has no thermometer, she should see that the dough in all the risings is kept moderately warm, but not up to blood heat. Any water used in mixing the dough should be moderately warm, but by no means hot. This sponge, if kept at the proper temperature, should, after two hours, become quite light.

To this well-risen sponge, which now will be found to be quite soft, add the remainder of the flour, kneading thoroughly until a smooth and elastic dough has been formed. The dough must be very stiff, since the boiled potato contains a large amount of water, which causes the dough to soften as it rises. Do not add water to the dough unless it is absolutely necessary to work in the flour. Set the dough back to rise again (temperature as about 86 degrees Fahrenheit) until it has trebled in volume, which will require another hour or two. Then divide the dough into four approximately equal parts, reserving a tiny lump weighing 2 or 3 ounces for an "indicator." Shape the sample into a ball and press it into the bottom of a tumbler with straight sides. The glass should be slightly warmed. Note the volume of the ball of dough in the tumbler and mark the glass at twice this volume.

Mold the four portions into loaves and place in greased pans which have been slightly warmed. Place the glass containing the "indicator" beside the pans and let all rise, under proper temperature, until the "indicator" shows that it has doubled in volume, then place the loaves in the oven and bake in a good, steady heat (400 degrees to 425 degrees Fahrenheit) for 45 minutes.

To Test Oven.

When no oven thermometer is at hand, a convenient test will be to put a teaspoonful of flour in an earthen dish in the oven. If this flour becomes light brown evenly throughout in 5 minutes' time, the oven is right for break baking. If the flour scorces in that time, the oven is too hot.

Potato Bread—Sponge Method.

For four 1-pound loaves are required:

3 pounds of boiled and peeled potatoes.
2¼ pounds of good bread flour.
3 level tablespoonfuls of sugar.
1½ level tablespoonfuls of salt.
1 cake of compressed yeast.
4 tablespoonfuls of water.

Boil, peel and mash the potatoes as directed in the straight dough method. In the evening take 1 1-2 pounds, or 2 1-2 solidly packed half-pint cupfuls, of the cool mashed potato, add to it the salt, 4 ounces of flour (1 scant half-oint cupful), and the yeast rubbed smooth with the water, reserving one spoonful to rinse the cup.

In the morning add the remainder of the potato, the sugar, and the rest of the flour, Knead thoroughly until a smooth, and very stiff dough is formed. After working the dough, set it to rise according to the directions given for the second rising under the straight dough method. Thereafter handle the dough exactly in the same way as is given under the straight dough method.

Instead of Baby Basket.

A sanitary substitute for the beribboned basket is a white enabeled oblong pan, which may be purchased anywhere at small cost. Have it large enough to hold all of the baby's toilet articles. It may be kept immaculate very easily, and, matching the tub, is very attractive.—Mother's Magazine.

Aluminum Nickel-Plated.

By a new French process aluminum can be so substantially nickel-plated that the metal can be hammered and bent without cracking.

If All Who Hate.

If all who hate would love us,
And all our loves were true,
The stars that swing above us
Would brighten in the blue;
If cruel words were kisses,
And every scowl a smile,
A better world than this is
Would hardly be worth while;
If purses would not tighten
To meet a brother's need,
The load we bear would lighten
Above the grave of greed.

If those who whine would whistle,
And those who languish laugh,
The rose would rout the thistle,
The grain outrun the chaff;
If hearts were only jolly,
If grieving were forgot
And tears of melancholy
Were things that now are not,
Then love would kneel to duty,
Then all the world would seem
A bridal bower of beauty,
A dream within a dream.

If men would cease to worry,
And women cease to sigh,
And all be glad to bury
Whatever has to die;
If neighbor spake to neighbor,
As love demands of all,
The rust would eat the saber,
The spear stay on the wall;
Then every way would glisten,
And every eye would shine,
And God would pause and listen,
And life would be divine.

—Washington Star.

Foods That Go Together.

To make a balanced meal the correct combinations of food must be used. With veal roast may be used tomato sause, peas, rice balls, asparagus, spinash, white or sweet potatoes.

With stewed veal dumplings, baked potatoes or tomatoes.

With veal loaf rice, peas, asparagus, scalloped or sweet potatoes.

With pork serve apple sauce, sour jelly, sweet potatoes, squash, kale, spinach, corn, beets. Fresh pork, apple sauce, boiled potatoes, squash, kale, spinach.

With leg of mutton serve caper or mint sauce, cabbage, creamed turnips, boiled rice. Mutton chops, creamed potatoes, peas, tomato sauce. Lamb, mint sauce, cucumbers, white or sweet potatoes, squash, parsnips, egg plant, peas or asparagus tips.

Popular Crochet Designs

By WINIFRED WORTH

Cross Bar Edging.

Is very durable and makes an ideal edging for towels made from No. 20 mercerized crochet cotton. Try it.

Chain 20.

1st Row—1t. in 5th st. from hook, ch. 2, skip 2 st. in ch., 1 t. in 3rd st., repeat twice; skip 2 st., 2 t. ch. 3, 2 t. in same st., forming shell, ch. 2, 1 t. in last st. of ch., turn.

2nd Row—Chain 4, 1 t. in last st. of shell, ch. 2, shell into shell, 1 t. in top of t. before shell, 1 space, 4 t. in next sp., 2 sp., turn.

3rd Row—Chain 4, 4 sp., shell into shell, ch. 2, 1 t. in last st. of 2nd shell, ch. 2, 1 t., repeat to end, making 3 sp. from shell, turn.

4th Row—Ch. 4, 4 sps., shell into shell, 1 sp., ch. 2, 4 t. in 2nd space, ch. 2, 1 t., repeat to end, turn.

5th Row—Chain 4, 4 sps., to shell, shell into shell, ch. 2, 4 sps., to end, turn.

6th Row—Chain 4, 6 spaces to shell, shell into shell, proceed as in 4th row, turn.

7th Row—Make same as 5th row to shell, shell in shell, 3 dc., into each sp. to point, 6 dc. in sp. at point, 3 dc., in remaining sps. to beginning ch., turn.

8th Row—Chain 4, 1 t. in 3rd st. of dc., ch. 2, 1 t. in next 3rd, repeat to shell, shell into shell, repeat 6th row, turn.

9th Row—Same as 7th row to end of shell, 1 t. in top of last t. before shell on 8th row, ch. 5, 1 dc. in center of 1st sp., repeat around whole point, turn.

10th Row—Chain 6, 1 picot, ch. 2, 1 dc. in center of last 5 ch., repeat to shell, shell into shell and repeat 8th row. This completes one point; proceed as in 1st row.

Cloverleaf Edging.

By following the instructions you can duplicate this dainty pattern which is favored by all crochet workers.

Chain 24.

1st Row—1 t. in 4th st. from hook 1 t. in next 2 sts., ch. 2, skip 2 sts., 1 t., ch. 2, skip 2 sts. 3 t. in next st., ch. 2, 3 t. in same st., forming shell, ch. 2, 1 t., ch. 2, 1 t., ch. 9, 1 t. in end of ch. 24, ch. 2, 1 t. in same place, repeat twice, turn.

2nd Row—Ch. 1, 1 dc. in first ch. of 2, 3 t. in same ch., 1 dc. in same, ch. repeat in the other 2 chs., ch. 9, 1 t. in 2nd st. of 1st ch. of ch. 2, shell into shell, ch. 2, 1 t., ch. 2, 3 t., turn.

Rows 3, 4, 5 and 6—Same as 2nd and 3rd, increasing spaces 1 each time.

Buying

Economy in Large Quantities

By ALVARA P. WILLIAMS, Shelton, Wash.

There is great temptation in these days of sky prices to buy groceries and meat in small quantities; even some retail grocers are advising it, due to their difficulty in securing full shipments of their orders. Yet with the certainity that it will be some time before prices will be normal again, the housewife who has to economize to the last inch will make every effort toward wholesale buying where she can.

Few women realize what a saving there is in the differences between the wholesale and retail prices of staple groceries. If they were told that they could earn from 10 per cent to 20 per cent on their money, if they had some to invest, would they hesitate, if it were a safe investment? Why should they hesitate to save this 10 per cent or more, when applied to the money they spend?

The arguments put forth for buying in small quantities should apply only to the city housekeeper with lack of storage space. The country housekeeper, unless within easy reach of free delivery groceries, is more apt to buy in larger quantities, but even then she seldom realizes what is the actual result of even larger quantities. The best training for this system of economy is to live, as I do, where supplies must be ordered for a month or two in advance, to avoid being in a constant state of upheaval because of mistakes on the part of the grocery clerk, the transportation, delay due to returning goods, etc. After a year of this it dawned on me that I could do even better by buying staple groceries and package goods by the dozen, instead of merely at jobbers' prices for single packages. A neighbor or two help fill out a respectably large order, with the additional saving of free freight.

Here are some of the items in average grocer lists, with retail and average jobbing prices in western Washington, with approximately percentages saved. Are they worth considering in your family?

Baking soda, usually 8 or 10 cents a package, 70 cents a dozen, 25 per cent.

Breakfast cereals selling at 25 cents a package, $2.50 a dozen, saving nearly 20 per cent.

Beans, 3 pounds for 25 cents, average 14 pounds for $1, about 15 per cent.

Gelatine, 15 cents a package, $1.35 a dozen, saving 25 per cent.

Soap, 5 cents a cake, from $4 to $4.50 a box, saving 25 per cent.

Cornstarch, 10 cents a package, $1 a dozen, 20 per cent.

Old Dutch Cleanser, 10 cents a package, 95 cents a dozen, 20 per cent.

Matches, 5 cents a package, 50 cents a dozen, 20 per cent.

Even those housewives who live beyond the reach of jobbing houses will find that the average retail grocer, for the sake of turning over his stock quickly, will be glad to quote wholesale prices nearly as low as these.

Some Don't.

An American just returned from Europe tells this story:

While riding from London to Liverpool in a railway coach it happened that he was alone in the compartment with an Englishman, who appeared to be deeply engrossed in the war news of one of the papers.

Thinking to start conversation, he said in good, old American slang, "Some fight, eh?"

"Yes, and some don't!" was the reply.—Exerbody's magazine.

Kept Their Word.

Mother—Children, I'm shocked! You each promised me you wouldn't eat your oranges till after dinner. You have deceived me.

Willie—No, mamma, we didn't eat our own oranges. Tommy ate mine and I ate his.—Boston Transcript.

Cross-Stitch Gathering.

The very full sleeves of a child's frock may be confined at the wrist by a double row of gathering over which is worked a band of cross-stitching in natural flower colors. When the canvas threads are pulled out the effect will be seen to be even prettier than smocking.

When Knighthood Was in Flower

BY EDWIN CASKODEN

(Continued from page twenty.)

the girls into peals of soft laughter and put us all at our ease immediately.

Ah! what a thing it is to look back upon; that time of life when one finds his heaven in a ready laugh!

"Be seated all," said the princess. "This is to be without ceremony, and only we four. No one knows a word of it. Did you tell anyone, Sir Edwin?"

"Perish the thought," I exclaimed.

She turned her face toward Brandon, "—but I know you did not. I've heard how discreet you were about another matter. Well, no one knows it then, and we can have a famous evening. You did not expect this, Master Brandon, after my reception of you the other morning? Were you not surprised when Sir Edwin told you?"

"I think I can safetly say that I was prepared not to be surprised at anything your highness might graciously conclude to do—after my first experience," he answered, smiling.

"Indeed?" returned Mary with elevated eyebrows, and a rising inflection on the last syllable of the word. It was now her turn for a little surprise. "Well, we'll try to find some way to surprise you one of these days;" and the time came when she was full of surprises for him. Mary continued: "But let us not talk about the other day. Of what use are 'other days' anyway? Before the evening is over Master Brandon, we want you to give us another sermon," and she laughed, setting off three other laughs as hearty and sincere as if she had uttered the rarest witticism on earth.

The princess had told Jane and Jane had told me of the "Sermon in the Park," as Mary called it.

"Jane needs it as much as I," said the princess.

"I can't believe that," responded Brandon, lookjng at Jane with a softening glance quite too admiring and commendatory to suit me; for I was a jealous little devil.

The eyebrows went up again.

"Oh! you think she doesn't? Well! in truth, Master Brandon, there is one failing that can not be laid at your door; you are no flatterer." For answer Brandon laughed and that gave us the cue, and away we went in a ripping chorus, all about nothing. Some persons may call our laughter foolish, but there are others who consider it the height of all wisdom. St. George! I'd give my garter for just one other hour of youth's dancing blood and glowing soul-warmth; of sweet, unconscious, happy heart-beat and paradise-creating joy in everything.

After a few minutes of gay conversation, in which we all joined, Mary asked: "What shall we do? Will one of you suggest something?"

Jane sat there looking so demure you would have thought mischief could not live within a league of her, but those very demure girls are nearly always dangerous. She said, oh! so innocently: "Would you like to dance? If so, I will play." And she reached for her lute which was by her side.

"Yes, that will be delightful. Master Brandon, will you dance with me?" asked the princess, with a saucy little laugh, her invitation meaning so much more to three of us than to Brandon. Jane and I joined in the laugh, and when Mary clapped her hands that set Brandon off too, for he thought it the quaintest, prettiest little gesture in the world, and was all unconscious that our laugh was at his expense.

Brandon did not answer Mary's invitation—the fit of laughter had probably put it out of his mind—so she, evidently anxious to win or lose her wager at once, again asked him if he danced.

"Oh, pardon me. Of course. Thank you." And he was on his feet beside her chair in an instant ready for the dance. This time the girl's laugh, though equally merry, had another tone, for she knew she had lost.

On they stepped upon the polished floor, he holding her hand in his, awaiting the pause in the music to take the step. I shall never forget the sight of those two standing there together—Mary, dark-eyed and glowing; Brandon, almost rosy, with eyes that held the color of a deep spring sky, and a wealth of flowing curls crowning his six feet of perfect manhood, strong and vigorous as a young lion. Mary, full of beauty-curves and graces, a veritable Venus in her teens, and Brandon, an Apollo, with a touch of Hercules, were a complement each to the other that would surely make a perfect one.

When the music started, off they went, heel and toe, bow and courtesy, a step forward and a step back, in perfect time and rhythm—a poem of human motion. Could Brandon dance? The princess had her answer in the first ten steps. Nothing could be more graceful than Brandon's dancing, unless it were Mary's. Her slightest movement was grace itself. When she would throw herself backward in thrusting out her toe, and then swing forward with her head a little to one side, her uplifted arm undulating like the white neck of a swan—for her sleeve, which was slit to the shoulder, fell back and left it bare—she was a sight worth a long journey to see. And when she looked up to Brandon with a laugh in her brown eyes, and a curving smile just parting her full, red lips, that a man would give his very luck to—but I had better stop.

"Was there ever a goodlier couple?" I asked of Jane, by whose side I sat.

"Never," she responded as she played, and, strange to say, I was jealous because she agreed with me. I was jealous because I feared it was Brandon's beauty to which she referred. That I thought would naturally appeal to her. Had he been less handsome I should perhaps have thought nothing of it, but I knew what my feelings were toward Mary, and I judged, or rather misjudged, Jane by myself. I supposed she would think of Brandon as I could not help thinking of Mary. Was anything in heaven or earth ever so beautiful as that royal creature, dancing there, daintily holding up her skirts with thumb and first finger just far enough to show a distracting little foot and ankle, and make one wish he had been born a sheep rather than a sentient man who had to live without Mary Tudor? Yet, strange as it may seem, I was really and wholly in love with Jane; in fact, I loved no one but Jane, and my feeling of intense admiration for Mary was but a part of man's composite inconstancy.

A woman—God bless her—if she really loves a man, has no thought of any other; one at a time is all-sufficient; but a man may love one woman with all the warmth of a simoon, and at the same time feel like a good healthy south wind toward a dozen others. That is the difference between a man and a woman—the difference between the good and the bad. One average woman has enough goodness in her to supply an army of men.

Mary and Brandon went on dancing long after Jane was tired of playing. It was plain to see that the firl was thoroughly enjoying it. They kept up a running fire of small talk, and laughed, and smiled, and bowed, and coutesied, all in perfect time and grace.

It is more difficult than you may think, if you have never tried, to keep up a conversation and dance La Galliard, at the same time—one is apt to balk the other—but Brandon's dancing was as easy to him as walking, and, although so small a matter, I could see it raised him vastly in the estimation of both girls.

"Do you play triumph?" I heard Mary ask in the midst of the dancing.

"Oh! yes," replied Brandon, much to my delight, as the princess threw a mischievous, knowing glance over her shoulder to see if I had heard. She at once saw I had, and this, of course, settled the wager.

"And," continued Brandon, "I also play the new game, 'honor and ruff,' which is more interesting than triumph."

"Oh! do you?" cried Mary. "That will more than compensate for the loss of my ten crowns. Let us sit down at once; I have been wishing to learn, but no one here seems to know it. In France, they say, it is the only game. I suppose there is where you learned it? Perhaps you know their new dances too! I have heard they are delightful."

"Yes, I know them," replied Brandon.

"Why, you are a perfect treasure; teach me at once. How now, Master of the Dance? Here is your friend outdoing you in your own line."

"I am glad to hear it," I returned.

"If Lady Jane will kindly play some lively air, written in the time of 'The Sailor Lass,' I will teach the Lady Mary the new dance," said Brandon.

Jane threw one plump little knee over the other and struck up "The Sailor Lass." After she had adjusted the playing to Brandon's suggestion, he stepped deliberately in front of Mary, and, taking her right hand in his left, encircled her waist with his right arm. The girl was startled at first and drew away. This nettled Brandon a little and he showed it plainly.

"I thought you wished me to teach you the new dance?" he said.

"I do, but—but I did not know it was danced that way," she replied with a fluttering little laugh, looking up into his face with a half shy, half apologetic manner, and then dropping her lashes before his gaze.

"Oh, well!" said Brandon, with a Frenchman's shrug of the shoulders, and then moved off as if about to leave the floor.

"But is that really the way you—they dance it? With your—their arm around my—a lady's waist?"

"I should not have dared venture upon such a familiarity otherwise," answered Brandon, with a glimmer of a smile playing around his lips and hiding in his eyes.

Mary saw this shadowy smile, and said: "Oh! I fear your modesty will cause you hurt; I am beginning to believe you would dare do anything you wish. I more than half suspect you are a very bold man, notwithstanding your smooth, modest manner."

"You do me foul wrong, I assure you. I am the soul of modesty, and grieve that you should think me bold," said Brandon, with a broadening smile.

Mary interrupted him. "Now, I do believe you are laughing at me—at my prudery, I suppose you think it."

Mary would rather have been called a fool than a prude, and I think she was right. Prudery is no more a sign of virtue than a wig is of hair. It is usually put on to hide a bald place.

(To be continued in the next issue.)

Jimmy's Descent.

Deacon Dryden was a bitter foe of the demon rum. His clerk, Jimmy Jetro, was, in secret, quite friendly with the horrid monster.

Jimmy roomed above a store. One Sunday morning, after a session at poker, Jimmy started to descend the stairs, which abutted on the street. An overload of whisky caused him to fall down the steps and roll to the middle of the sidewalk, just as the deason passed on his way home from church.

"Why, James!" exclaimed the startled deacon. "What is the matter?"

"N—othing—nothing at all," stammered Jimmy. "That's the w—way I always come down stairs." St. Louis Globe-Democrat.

Economy.

"What is this?" exclaimed the young husband, referring to the memorandum she had given him. "One dozen eggs, a pound of raisins, bottle of lemon extract, a tin of ground cinnamon and a half pound of sugar. What on earth do you want with all these things, Elsie?"

"I've got a stale loaf," replied the young wife, "that I am going to save by working up into a bread pudding. I never let anything go to waste, Henry—especially in war times!"—London Answers.

The Safety Kero Lamp

The Safety Kero Lamp makes its own gas from either common coal oil or gasoline. Turns night into day. Gives better light than gas, electricity of 18 ordinary lamps at one-tenth the cost. For Homes, Stores, Halls, Churches. Can be used for a hanging lamp or reading lamp. Absolutely safe.

Simply send us Money Order for $7.50; receive this lamp; use it for 15 days; if not satisfied in every way return it to us, and we will refund your money, less postage.

"—and he is making good!"

THESE FIVE WORDS

finished a sentence in a letter sent from this office recently to the father of a farmer boy. The young man was then—and is now—following our Money Making Plan for boys on the Farm. His father was curious to know what we thought of his work, and we told him.

What a satisfaction to both father and son to have it said "—and he is making good!"

This case has many parallels—young men who know the real value of spare time and, with our Money-Making Plan, have been able to fight their way out of the jungles of uncertainty and make straight for the Highway of Success.

You can do it, too.

If you want to give all or a part of your time to this work, send us a postal card and we will send you complete information immediately. Do it today.

My Dear Children: I am so pleased to get so many letters from my little nephews and nieces. I wish you could see the stack of them on my desk, just waiting to be published. If you have written a letter to Aunt Nellie and have not yet seen it in print, don't get discouraged—it is only waiting its turn. I am publishing them in the order they are received. Would you like to read the names of the little boys and girls who have sent in letters which we have as yet not had room to print? Here they are; maybe your name is here, or perhaps you will know some one mentioned in the following list, and the letters will be printed in the Children's Corner later on. AUNT NELLIE.

Emma Short, Lowden, Wash.; Mable Schlef, Oroville, Wash.; Grace Humbly, Friday Harbor, Wash.; Charles Lee, Othello, Wash.; Irene M. M. Glissler, Odessa, Wash.; Margaret Cox, Leahy, Wash.; Frank Clinton Saeger, Shelton, Wash.; Ruth Wagner, Gilmer, Wash.; Ethel Greely, Riverside, Wash.; Lucile Peterson, Foster, Wash.; Myrtle Sodorff, Johnson, Wash.; Flora Lamurs, Johnson, Wash.; Vera V. Gensel, Aeneas, Wash.; Maude Bailey, Malo, Wash.

MARY GOT A BABY BROTHER FOR A CHRISTMAS GIFT

Dear Aunt Nellie: My Christmas gift was a baby brother born December 23. He has dark hair, blue eyes, and weighed 10 pounds. I just love him. We now have six in our family I have one sister and two brothers. I am the first girl. I am the oldest in our family. Leonard comes next, he is nine years, Margaret next. She is 7 and next comes my new brother. His name is William McDole Allen, but we call him Allen. I would not part with him for all the world. I also got a kewpie handkerchief and a fancy one, a doll and some hand crocheted caps, one red trimmed in white, one pink and one white trimmed in blue. I also got a clown and a crocheted collar and a doll bonnet. There was a little pink jacket too and it had fancy stitching on it. I got a candy rooster and candy, cookies, oranges, apples, nuts and fruit, and so may more things that I can not waste time to tell.—Mary Symington, Kangley, Wash.

WILL BE GLAD WHEN IN THE EIGHTH GRADE AT SCHOOL

Dear Aunt Nellie: I enjoy reading the letters of the other children and I thought they would enjoy reading a letter of mine. I am 9 years old. My birthday is July 24. We live on a ranch of 120 acres. We have one cow, one dog, four little kittens and one old one. I am the youngest one in the family. I have two sisters and two brothers. My brothers' names are Oades and Bruce. My sisters' names are Vonda and Orphia. We live about two miles from school. I walk to school with my sisters and brothers. I like my teacher very much. Her name is Miss Diskerll. We have a very nice schoolhouse. It is a large brick building. There are from the first to the 12th grades in the one building. The girls in the sixth and seventh grades take sewing and all the boys take manual training. The girls in the eighth grade take cooking. I am only in the fourth grade now but I will be glad when I get in the eighth grade so I can take cooking, for I enjoy it very much. I have one old black hen. I named her Fannie because by Aunt Fannie gave her to me for my birthday. Ruby Warren, a girl who wrote to the Corner some time ago, is one of my nearest neighbors.—Dora Boulden, R. F. D. 1, Box 2, Elma, Wash.

WHEN SUMMER COMES ALICE ALWAYS MISSES THE FARM

Dear Aunt Nellie: I am 12 years of age, and in the seventh grade. My teacher's name is Miss Tobie. I lived on the farm about nine years, when we moved to the town of Latah. I enjoy living in town, especially in the winter, but when summer comes I always miss the farm, because I often climbed the mountains and picked the lovely flowers. I have six sisters. One is married and has one of the sweetest babies I ever saw. She was one year old on Christmas day. We all think very much of her. Another one of my sisters is going to the Cheney normal. My birthday is August 15. I have two pet rabbits.—Alice Michel, box 46, Latah, Wash.

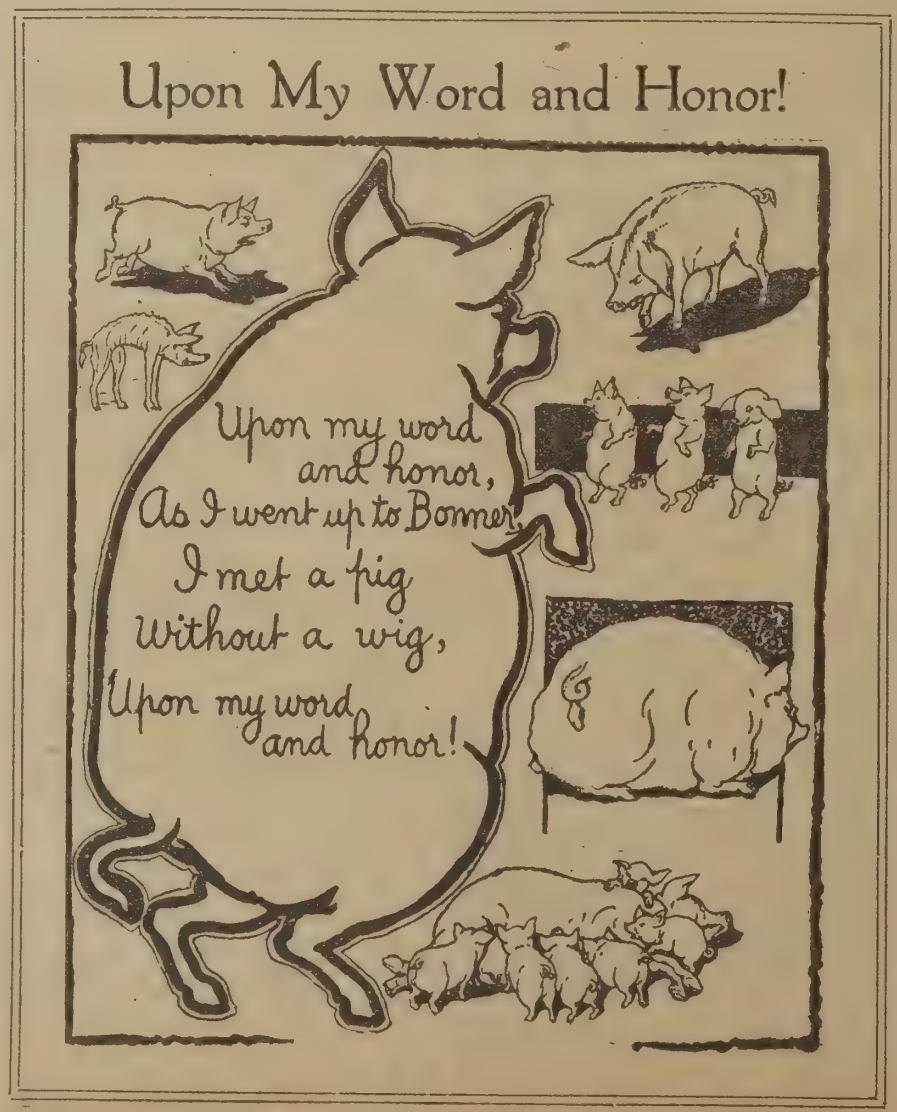
MELBA HAS A PONY AND RIDES HER A MILE TO SCHOOL

Dear Aunt Nellie: I am 8 years old and in the third grade. I will be 9 June 25. My teacher's name is Mrs. Alice Riplinger. She is a splendid teacher. There are only five scholars in our school. I have one brother and his name is Clifford. In the line of pets I have three dogs, one cat and lots of rabbits. We live on a farm and have pigs, cows, chickens, ducks and horses, as farmers usually do. I perfer the country life to the city. I used to live in Mount. Vernon. I have a pony and can ride her. I sometimes ride her to school. School is one mile from home.—Melba E. Adams, Cunningham, Wash.

LILLY HAD THE GRIPPE, BUT ONLY MISSED ONE DAY OF SCHOOL

Dear Aunt Nellie: We have about six or seven inches of snow here. I have a flexible flyer and will soon be coasting on it when a track is made. We had an entertainment at our school house December 3. Every one that was there got a sack of candy and an orange. I had the grippe about three weeks ago, but only missed one day of school. Last year I missed nine days of school with the grippe. I think I will tell you about my school house now. It is a small one; it is painted white on the outside and green on the inside. In it there are 15 seats, the teacher's desk and organ, a bookcase full of books, eight blackboards, a stove, two dictionaries, a globe, some pictures and maps on the wall. There are 14 pupils in our school now. We get pretty cold sometimes in winter when we go to school. We had a week's vacation at Thanksgiving and Christmas.—Lily Campbell, Wilbur, Wash.

MARIE AND BROTHERS RIDE FIVE MILES IN CART TO SCHOOL



Dear Aunt Nellie: I was 11 years old January 8. I live on a 640-acre farm with papa, mama and my three brothers. My smallest brother is five years old and his name is Kenneth. He does not go to school yet. My brother Stanley is six years old and is in the first grade. My brother Melvin is nine years old and in the fifth grade. We ride five miles in a cart and drive a horse named Babe. My teacher's name is Miss Philips. She is a nice teacher. There are 12 pupils in the whole school, four are in my grade. I'm the only girl in the school. We are the only children that ride to school and have so far to go. The schoolhouse is at Bolles Junction. We have a hot dish to eat with our lunch. It is a nice schoolhouse. We have one cat named Bluebell and a cow named Bessie and nice flock of purebred chickens.—Marie Stewart, R. F. D. 3, Waitsburg, Wash.

LIKES THE SUMMER WHEN CHERRIES AND PEACHES ARE RIPE

Dear Aunt Nellie: I'm writing my first letter to the Children's Corner. I am 11 years old December 29. I'm in the fifth grade. My subject is "likes." I like everything the whole year through. I like spring when little birds build their nests and their sweet songs fill the air. I like the summer when the cherries are ripe and the peaches are so sweet and juicy and I like autumn when the trees lose their leaves. And I like winter best of all, when children coast down hill. I have a mile to go to school. My teacher's name is Mrs. Schold.—Hazel Saltmarsh, Coulee City, Wash.

HAVE TEN NEW SEATS IN SCHOOL BUT ARE ALL TOO SMALL

Dear Aunt Nellie: I am going to tell you about my school. There are 14 children. My teacher's name is Ina Barnard. We got 10 new seats and they are so small any body can hardly sit in them. One day some visitors came and they had to lift their feet up to get out of them. In the schoolhouse there is a stove in one corner and a library in another corner. I build the fires in the morning. I get $1.50 a month for it.—Herbert Cone, R. R. 1, Reardan, Wash.

IN THE SUMMER ELEANOR GOES BOATING AND WADING

Dear Aunt Nellie: I am going to start writing and I hope I never will quit. I have only read the Children's Corner twice and I enjoyed the letters of other children very much. I am nine years old and I am in the fourth grade. My birthday is July 9. I live on a farm of 21 acres. We have two calves, three horses, two cows, two cats, one dog, and quite a number of chickens. I have two sisters and two brothers. I have a brother and two sisters married. My brother that is married has three children. I go to school every day. I like to go to school and I like my teacher and playmates. There are 23 pupils in our room. Some of the children's paintings are up in front of the room. I like to live on a farm in the summer. I can go in bathing and pick pretty flowers. In the winter I can go skating on the ponds, and when it snows I can make snow men. That is my greatest pleasure. In the winter I just eat apples. I take music lessons on the piano. I like to take lessons. Santa Claus brought me a doll and a new ribbon, a new handkerchief, a new dress and coat and shoes.—Eleanor Dobers, Anacortes, Wash.

ALICE IS TEN YEARS OLD AND IS A GOOD COOK

Dear Aunt Nellie: I have been reading other little girls' letters that you have been printing. I am a little girl 10 years old. I have five sisters and one brother. I am in the fourth grade. I used to live on the farm and moved to town a few weeks ago. I will tell you what I did on the farm. In the summer we milked five cows and had the headers about the middle of the summer. I know how to bake cakes, pies, and wash dishes, and many other things. I get the cows in the summer.—Alice Reinbold, Star Route, Davenport, Wash.

NELLIE WISHES TO CORRESPOND WITH SOME OF HER COUSINS

Dear Aunt Nellie: I am 14 years old, and my birthday was January 7. Sallie Garry is a little older than I, but I am sure I would like to hear from her. I think she has done real well in the cattle business. I am attending school at Providenec academy in Vancouver, Wash., but was home for vacation. We live on a farm of 600 acres in eastern Washington. I have two horses of my own. Their names are Midget and John. I would like very much to correspond with some of my new friends in the Corner who are about my age.—Nellie McGrail, Sixprong, Wash.

MAY HAD HER TOOTH PULLED THE OTHER DAY AND IT HURT

Dear Aunt Nellie: We have 15 cows. I like to go to school. My teacher's name is Miss Knapp. I have three brothers, Basil, Bruce and Charles, who is the baby of the family. He is only 6 months old. My papa pulled my tooth the other day and it did hurt. We have lots of fun in summer at harvest time. I am 8 years old. My birthday is June 26.—May Millan, Menlo, Wash.

HENRY HAS A SHETLAND PONY AND TWO GEESE FOR PETS

Dear Aunt Nellie: I am going to tell you about our farm. I am 12 years old and I have a Shetland pony, and two geese. I have four brothers. We have four horses and four cows, and three calves. We have two dogs and we have about 50 chickens. I ride my pony to school. It is a mile and a half to our schoolhouse. I am in the third grade. My teacher's name is Mrs. Calley.—Henry Merrick, Fishtrap, Wash.

BASIL HAS A GUN AND GOES HUNTING DURING VACATION

Dear Aunt Nellie: I have a gun and went hunting during vacation. I am 11 years old. I am in the sixth grade. I would like to see Clayton Beason. He used to live in Menlo. We have 27 head of cattle, 15 cows and four yearlings, five little calves and three horses. We have a dog and her name is Dot and a cat.—Basil Millan, Menlo, Wash.

DOROTHY TOOMBS IS SEVEN AND IN THE FOURTH GRADE

Dear Aunt Nellie: I have been reading the letters in the Children's Corner and I am going to try to write a letter. I am going to tell you about the fun we have at school. I am seven years old and in the fourth grade. I have two sisters and three brothers. We have a little dog and his name is Happy. We have five cats. I live on a farm of 160 acres. We play all kinds of games at school. I hope to see my letter in print.—Dorothy Toombs, Wren, Ore.

Grain and Produce Markets

Chicago Grain.

CHICAGO, Jan. 20.—Fear of German sea rovers put a stop to export of wheat today and caused a material sag in prices. The result was an unsettled close, 5-8c to 1 7-8c net lower, with May at $1.86 1-8 to $1.86 3-8 and July $1.51 1-2 to $1.51 5-8. Corn finished 5-8c to 7-8@1c down and oats off 3-8c to 1-2c. Provisions showed losses varying from 2 1-2c to 12 1-2c.

Depression ruled in the wheat pit right from the outset and there was at no time any important rally.

Canadian shipments of much low grade wheat to Minneapolis formed an additional element against the bulls. Other dispatches from the northwest said wheat in cars that could not go east was almost unsalable, even at discounts of 5 cents a bushel.

Corn fell with wheat. Oats had no independence and merely followed the descent of other cereals.

Weakness of hogs and grain eased down the provision market. Besides abnormal freight rates on the ocean were expected to curtail the outgo to Europe.

Pacific Northwest Grain.

PORTLAND, Ore., Jan. 20.—Grain: January delivery: Wheat—Bluestem, $1.67; fortyfold, $1.63; club, $1.62; red Russian, $1.58.

Oats—No. 1 white feed, $36.75.

Barley—No. 1 feed, $40.

Futures: February-March bluestem, $1.68; fortyfold, $1.63; club, $1.62; Russian, $1.58. Oats, $37.

Barley — February, $40; March, $40.50.

SEATTLE, Wash., Jan. 20.—Wheat—Bluestem, $1.66; Turkey red, $1.66; fortyfold, $1.63; club, $1.63; fife, $1.63; red Russian, $1.61.

Barley—$39 per ton.

TACOMA, Wash., Jan. 20.—Wheat—Bluestem, $1.70; fortyfold, club and red fife, $1.66; red Russian, $1.64.

WILBUR, Wash., Jan. 20:—Bluestem, $1.55; club, $1.50. Oats, $36. Barley, $36. The farmers of this vicinity sold 63,000 bushels of wheat here during the last week. The price ranged from $1.50 to $1.57.

Spokane Market.

The wholesale prices quoted in the list below are not the prices paid to producers or shippers; they are those charged by the Spokane commission houses to the retail trade for standard produce. The prices quoted for live stock, however, are the prices given to the producer.

Potatoes—Potatoes, $2@2.25 cwt; new potatoes, 15c lb; sweet potatoes, $6.

Apples—Washington apples, cooking, 60c@$5c; eating, $1@1.25; Wageners, 85c@$1.35 box; Jonathans, $1.25@1.35 box; Winter Bananas, 80c box; Kings, $1 box; Spitzenburgs, $2 box; Baldwins, 90c box; Delicious, large, $1.75@2.25 box; Rome Beauties, $1.25 box; Winesaps, $1.75@2 box; Y. N. Pippins, $1.75@2 box.

Butter—Blanchard cartons, 40c lb; Medo-Maid, 40c lb; Cascade, 40c lb; Gold Coin, 38c lb; Gold Leaf, 40c lb; Better butter, 40c lb; Hazelwood, 40c lb; Peerless, 38c lb; Jersey Belle, 39c lb; Attalia, 40c lb; Diadem, 40c lb; Jersey, 38c lb.

Cheese—Wisconsin full cream, twins, 28c; triplets, 28½c; Wisconsin limburger, 28c lb; brick cheese, 28c lb; domestic Swiss, 35c lb; western cream, Idaho or Oregon twin or triplets, 24c lb; Young Americas, 26c lb.

Eggs—Fresh local ranch eggs, $13@14; fresh eastern eggs, $13 case; eastern storage eggs $10 case.

Cattle—Prime steers, $5@6.50 cwt; heifers, $5@5.50; cows, $4@5.

Sheep—Wethers, $6@7 cwt; ewes, $5.50@6 cwt; lambs, $9 cwt.

Hogs—Heavy hogs, $9 cwt.

Live Poultry—Springs, 14c lb; hens, 13@14c lb; old roosters,6@7c lb; young ducks, 11@13c lb; geese, 10c lb; tom turkeys, 16c lb; hens, 17c lb; dressed tom turkeys, 28c lb.

Hide Quotations.

Green cows and steers—25 lbs. and up, 16½c; salted cured, 19c; green bulls and stags, 13c; salted cured, 15c; kip, 15 lbs. to 25 lbs., 21c; calf skins up to 15 lbs., 30c; dry flint hides, 32c; dry salted, 27c; dry calf skins, under seven lbs., 38c; dry sheep pelts, full wooled, 20-23c; dry shearlings, 10-75c each; green horse hides, $3 to $5 each; dry horse hides, $1 to $2 each.

Oregon Fruits.

PORTLAND, Ore., Jan. 19.—Controlling interest in the Oregon Fruit company which operated 11 packing plants in Oregon, passed today to the Pacific Fruit and Produce company, for $50,000, it was announced. The Pacific company owns plants in Oregon, Washington and California.

Western Potatoes.

MINNEAPOLIS, Jan. 19.—What is said to be the highest price paid for potatoes in the Minneapolis or St. Paul markets in the last 30 years was reached here today. Western potatoes sold at $2.10 a bushel in carload lots, while Minnesota grown potatoes were quoted at $1.85.

Seattle Market.

SEATTLE, Jan. 20.—Casting of accounts for the week-end shows the potato market at $60, abnormally light sales in Seattle, and eastern buyers, who have caused the high prices, backing away to bids of $35. Futures are mere guess work, but few wholesalers on Western avenue are willing to say that prices will not go higher. One fact glimmers through the trade this winter, and that is that the Seattle market can do without Yakima gems when prices are high. Sales of gems here for the last month for local consumption will not average a car a day.

All who are interested in the trade are endeavoring to get at an accurate estimate of the holdings in the Yakima valley. Brokers here place them at 1200 cars. Growers insist that there are not more than 500 cars.

Yakima onions, due to their superior quality and ideal weather conditions last season, are in better demand than Oregons, and the price differential for the first time has been wiped out. Both are selling at 6c per pound.

The fresh ranch egg market has collapsed for the week-end. The sudden softening of the weather has done more for the bears than all other elements and influences combined, and while jobbers are quoting 43c@44c they are doing it in whispers, leaving the prospective buyer at liberty to offer a cent less, with fair prospect of a trade.

The butter make is right up to the churns, as creamerymen say when using up all the cream that is offered, with no surplus. The market is exceedingly stiff.

Holders of cheese are making no special effort to market their stock. Prices are none too firm, and February is the month of greatest demand. No new cheese can be secured, and jobbers believe that high beef and pork prices will cause a cleanup at safe margins of profits.

BUYING PRICES.

Unless otherwise stated the following prices are fixed upon a jobbing basis and are average prices obtained in reports of transactions by jobbers.

The following prices are offered to the producer by the local dealers for delivery in round lots f. o. b. Seattle:

Eggs—Local, 36@39c per dozen.

Poultry—Live hens, fat, over 4 lbs., 18c per lb.; do, 3 lbs. and under, 15c; old roosters, 10c per lb.; springs, 18c per lb.; ducks, 19c per lb.; squabs, large, $3.50 per dozen; geese, fat, 12c per lb.; turkeys, live, 24c.

Butterfat—42c lb.; dairy butter, 28c per lb.

Beef—Buying price: Prime beef steers, 8c per lb.; cows, fat, 5@6c per lb.

Hogs—Light, 11 1-2@12c per lb.; do, heavy, 10@11c per lb.

Veal—Fancy light, 12 1-2@13c per lb.; do, heavy, 9@10c per lb.

Hides—Salted, 19c per lb.; salt kip, 22c per lb.; salted calf, 32@35c per lb.; green hides, 16c per lb.; salted bulls, 15c per lb.; dry hides (short trim), 32@33c per lb., dry calf, 12c; (under six lbs.), 36c per lb.; bull and dry salts, 4c per lb. less; green bulls, 18c per lb.; dry butcher full wool sheep pelts, 20@23c per lb.

Seattle Wheat.

SEATTLE, Jan. 20.—It is admitted by farmers and buyers alike that the volume of wheat that has changed hands this week has been unusually heavy, bids having reached an altitude that appeals to all holders, and unless there are serious breaks the present movement is likely to continue to a cleanup. Bids of $1.55 and $1.57 for bluestem, $1.57 for turkey red and $1.52 for club have had their effect.

There has been considerable conjecture as to how much of the 1916 wheat and carry over still remains unsold in Washington. Millers and exporters here are positive that there is less than 10 per cent, but how much less is controversial. Some heavily producing localities are cleaned up entirely. Others have 10 per cent, a few hold more. Reports of 5 per cent of wheat are frequent. Millers have made a rather exhaustive survey of the country and none will claim that horizontally Washington farmers hold more than 10 per cent. Many believe it will not reach that amount.

Portland Wheat.

PORTLAND, Ore., Jan. 20.—The wheat market eased off at the close of the week in response to the declines at Chicago, but before the drop came there was fairly liberal buying for account of eastern millers and also some purchasing in exporters. The present depression is regarded as merely temporary, and buyers would take on more wheat if they could get it at consessions, but farmers are not of this mind. Closing January wheat bids at the exchange were: Bluestem, $1.67; forty fold, $1.63; club, $1.62; red Russian, $1.58.

Oats and barley were firm and quiet at the end of the week.

Live Stock Quotations.

At Chicago.

CHICAGO, Jan. 20.—Receipts, 21,000, estimated Monday, 65,000; weak at yesterday's average to 5c lower. Bulk, $10.80@11.05; light, $10.50@11.05; mixed, $10.65@11.15; heavy, $10.70@11.15; heavy, $10.70@10.85; pigs, $8.25@10.15.

Cattle — Receipts, 500; estimated Monday, 25,000; steady. Native beef cattle, $7.60@11.75; western steers, $7.70@10; stockers and feeders, $5.75@8.75; cows and heffers, $4.70@10.10; calves, $10@14.75.

Sheep — Receipts, 7000; steady. Wethers, $9.85@11; lambs, $11.85@14.40.

At Omaha.

OMAHA, Neb., Jan. 20. Hogs—Receipts, 12,300. Heavy $10.75@11.10; light, $10.40@10.85; pigs, $8.50@9.75; bulk, $10.60@10.90.

Cattle—Receipts, 500; steady. Native steers, $7.50@11; cows and heifers, $6.50@8.50; western steers, $6.50@9.50; Texas steers, $6@7.75; stockers and feeders, $6.25@9.25.

Sheep—Receipts, 800; steady. Yearlings, $10.25@12.25; lambs, $13@14.05; wethers, $9.50@10.50.

At St. Paul.

SOUTH ST. PAUL, Minn., Jan. 20.—Estimated receipts at the Union stock yards today: Cattle, 400; calves, 50; hogs, 1400; sheep, 10.

Cattle—Quality cattle were more in evidence for Saturday than usual with steers selling up to $9.25 and the she stock at $7@8.50. The half thousand supply was taken over by packers at unchanged rates. The week closes with prices on most killing cattle 15c to 25c higher.

Hogs—A run of 1400 hogs here today cleared on a steady market, notwithstanding the fact that at outside points lower levels were reached. The range today was from $10.60 to $10.80 and bulk was between $10.65@10.70.

Sheep—With only a handful of sheep offered them today packers turned to a feed lot for killing material. They bought about 300 78-pound yearling lambs at $11.90. The week has brought out moderate supplies again, though one string of Montana ewes helped the market materially.

At Portland.

PORTLAND, Ore., Jan. 20.—Hogs steady. Receipts, 262. Bulk of packing grades, $10.50@10.60; heavy packing, 215-250 pounds, $10.55@10.65; heavy butchers, $10.50@10.60; light packing, 170-170, $10.40@10.50; rough heavies, $9.25@10; pigs and skips, $9@9.25; stock hogs, $8.25@9; cripples, $8@9.

Cattle steady. Receipts, six steers; prime light, $8.35@8.50; prime heavy, $8@8.35; good, $7.75@8; cows, choice, $7.35@7.50; medium to good, $6.25@7; ordinary to fair, $5.75@6.25; heifers, $4@7.50; bulls, $3.50@5.50; calves, $6@10.

Sheep steady; receipts, 617; lambs, east of mountains, $11@11.50; lambs, valley, $10.75@11; lambs, good, $9.75@10.25; choice yearling wethers, $9.75@10; good yearlings, $9.50@9.75; choice ewes, $8@8.25; heavy ewes, $6.75@7.50.

At Seattle.

SEATTLE, Jan. 20.—Receipts, 1071; hogs, 112.

Hogs—Prime light hogs, $10.60@10.70; medium to choice, $10.25@10.40; smooth heavy, $9.75@10.25; rough heavy, $9.15@9.75; pigs, under 150 pounds, $8.50@9.75.

Cattle—Prime light steers, $8.60@8.75; medium to choice, $8.25@8.50; common to good, $6.50@7.75; medium to choice, $7@7.25; common to good, $5@6.50; best bulls, $5@5.75; common bulls, $3.50@4.50; calves, $7@9.

Sheep—Prime lambs, $10.25@10.50; good lambs, $9.75@10; wethers, $8.50@9; ewes, $6.50@8.

Spokane Stock Yards Saturday.

Hogs—Receipts, 9; market strong. Prime heavy, $10.50@10.65; prime light, $10.30@10.50; prime mixed, $9.75@10; rough heavy, $9.25@9.75; pigs, $9.25@9.50; stockers, $6@8.50.

Cattle and calves—Receipts, 92; market strong.

Prime heavy steers, $8.25@8.50; prime light steers, $7.85@8.10; good steers, $7.50@7.75; stockers and feeders, $5.50@6.25; prime cows, $6.75@7.25; good cows, $6@6.50; best heifers, $6.50@7.50; bulls, $3.50@5.25; calves, $6.50@9.

Sheep—Receipts, none; market strong. Prime lambs, $11@11.50; common lambs, $10@10.50; best yearlings, $9.50@10; good yearlings, $8@8.50; best mutton ewes, $7.75@8; common ewes, $6@7.50.

Butter and Eggs.

CHICAGO, Jan. 20.—Butter, unchanged.

Eggs—Lower; receipts, 2173 cases. Firsts, 36@37c; ordinary firsts, 33@35c; at mark, cases included, 33@36½c.

SAN FRANCISCO, Jan. 20.—Eggs—Fresh extras, 37½c; pullets, 35½c.

Cheese, new, 17½c.

ELGIN, Ill., Jan. 20.—Butter—One hundred tubs at 36½c; 25 tubs at 37c.

PORTLAND, Jan. 20.—Butter—Higher; city creamery prints, 39c; country prints, 38c.

Portland Market.

PORTLAND, Ore., Jan. 20.—Continued efforts have been made to contract for 1917 wool in Oregon. It was rumored that fine wools in the Bend section were secured at 30 cents and one grower reported he was offered 32 cents, but in general the attempts of buyers to get wool on the sheeps' back met with failure.

The egg market, after touching the high point of 41 cents during the cold spell, slid back at the close of the week. Buyers, anticipating a farther drop, bought only what they had to have and as a result nearly all dealers carried stock over until Monday.

The butter market has been gaining in strength with a broader demand. Cubes are 2 cents higher than a week ago, and prints were raised 1 cent. No change was made in the buying price of butter fat. Cheese continues firm with demand from the east.

Potato buyers are offering $2@2.25 at country points, but there is hardly any selling by farmers who are excited by the reports of extreme prices being paid for potatoes in Washington. Dealers think present prices are partly the result of manipulation, and they look for a break when Idaho and Colorado resume shipping. The jobbing price on the street is now $2.25 to $2.50

In the following list of quotations the grain, hay, millfeed, hop, wool and hide prices are those paid to producers. The other quotations are prices from jobbers to retailers:

Oats—No. 1, $36.75 per ton.

Corn—Whole, $46; cracked, $47 per ton.

Millstuffs—Bran, $26.50 per ton; shorts, $30.50.

Barley—No. 1 feed. $40; brewing, nominal; rolled, $41@42.

Hay—Buying prices. Timothy, eastern Oregon, $18@21; alfalfa, $17@18; clover, $12.50; grain, $13@15.

Eggs—Oregon ranch, case count, 37@37c per dozen; candled, 40@42c.

Poultry—Hens, 14@17c; ducks, 16@18c; turkeys, live, 20@22c; dressed, 25@26c; geese, 12@14c.

Butter—City creamery, prints, 39@40c per pound; cubes, extras, 37c.

Cheese—Oregon triplets, 20c; Young Americas, not quoted.

Dressed meats—Veal, 15c; pork, 13c.

Hops—1916 crop, 5@9c.

Potatoes—Oregon, joobing price, $2.25@2.50 per cwt.

Onions—Buying price, $5 for country points.

Wool—Eastern Oregon, fine, 24@30c; coarse, 33@36c; valley, 33@35c.

Beans—Small white, 11 1-4c; large white, $11.10 per 100 pounds.

Hides—Salted hides (25c lbs. and up), 19c; salted stags (50 lbs. and up), 15c; green and salted kip (15 lbs. to 25 lbs.), 18c; green and salted calfskins (up to 15 lbs.), 27@28c; green hides (25 lbs. and up), 17c; green stags (50 lbs. and up), 13c; dry hides, 30c; dry salt hides, 25c; dry horse hides, $1 to $2; salt horse hides, $3 to $5.

Joseph Tniebes and C. T. Symmes,
1101-09 Railroad Ave., Spokane, Wash.

Big Business Opportunity for Right Men

We wish to hear at once from energetic, reliable men to whom we can assign valuable territory to handle McConnon's Products. Business is your own, permanent, profitable and steadily increasing. Capital and experience not required—we give full co-operation. Can refer to hundreds of McConnon Dealers, operating for years. McConnon & Company are well known, thoroughly established. McConnon's Products are bought by every farm home. Open territory limited. Splendid opportunity. Write at once for further information.

McConnon & Co.
333 Third Street
Winona, Minn.

WOLF SKIN BOUNTY.
Hunter Lives on Thunder Creek.

Ben Mutcher, who makes his winter headquarters in Thunder creek, up near the pass that leads over into the Park creek country, was in Mount Vernon, Wash., with a wolf skin measuring 64 inches from tip to tip. Mutcher took his skin to the country auditor who made out a claim for him for the amount of the bounty, $15. The swarthy mountaineer said he had sold about $60 worth of skins at Sedro-Woolley and that this one was also sold.

FARM LANDS—FOR SALE 651

WHY GO TO MONTANA OR CANADA WHEN YOU CAN BUY BETTER WHEAT LAND IN WASHINGTON FOR $20 PER ACRE? EASY TERMS.

720 acres, or will divide into smaller farms. This land is in the famous Waterville-Mansfield district, where there is plenty of water and moisture and the soil is a good, dark loam, with a clay subsoil; produces 30 to 40 bushels of wheat per acre; part of it is in cultivation, and practically all tillable; it lies close to the railroad and near a good town where there are good schools, churches, stores and other conveniences. The climate is excellent, and plowing can be under way very early in the spring. No severe winters to combat. This section of the country produces a very hard wheat, which commands the top price. We can sell this land for ¼ down and the balance a long time, at 6 per cent. Did you ever hear of anything better?
ARTHUR D. JONES & CO., SPOKANE.
ARTHUR D. JONES BLDG.

MONTANA GRAIN AND DIVERSIFIED farm land in Judith Basin, Shields River Valley, Great Falls District and other good districts. Prices $7 per acre and up for stock farms; $20 to $40 per acre for good grain land; small cash payment—balance easy terms and 6 per cent interest. Have a few places on which the owners will take some good Washington property as part payment—time on balance. Call or write for Montana land list and see us before you go. We can give you some pointers that will cost you nothing and will probably save you a lot of time and worry later. HEGE & SCHIFFNER CO., 715-17 Paulsen bldg., Spokane.

RAW LAND, SPECIALLY SUITED TO poultry raising and dairying. Ask for our 1916 offer and monthly payment plan. Office Wall and Post sts., near Post street bridge. Phoenix Lumber Co., Dept. A. Spokane, Wash.

NORTHERN PACIFIC RAILWAY LANDS in eastern Montana at $2.50 to $18 per a. Suitable for farming or grazing. Easy terms. For information write or see W. E. HOLT, MILES CITY, MONT.

FARM LANDS—FOR SALE 651 Continued.

GREAT NORTHERN LAND CO.
5792—320 acres choice Palouse land, in a high state of cultivation; fair buildings and good water; two miles from town, and a crackerjack at $67.50 per acre; terms.
640 acres raw wheat land, 500 of which is choice soil, the remainder fine pasture; three miles from station; owned by a nonresident; goes at $9 per acre. This is very cheap. Terms.
If going to Montana, see us, as we can save you money. For farm land come to headquarters.
G. N. LAND CO., COR. HOWARD AND 1ST.

YOUR CHANCE IS IN CANADA—RICH lands and business opportunities offer you independence. Farm lands $11 to $30 acre; irrigated lands, $35 to $50; twenty years to pay; $2000 loan in improvements, or ready-made farms. Loan of live stock; taxes average under 20c an acre; no taxes on improvements, personal property or live stock. Good markets, churches, schools, roads, telephones; excellent climate—crops and live stock prove it. Special homeseekers' fare certificates. Write for free booklets. Allan Cameron, Gen'l Supt. Land Branch, Canadian Pacific Ry. 92 Ninth ave. Calgary, Alberta.

BARGAINS IN FARM LAND.
Our business is loaning money on farm and city property. Occasionally we have properties for sale which have come into our possession on account of foreclosure of loans. These we offer at practically the net cost to us, which is far below their real value; a small payment down, the balance on easy terms, with low rates of interest. Send for list.
THE PENNSYLVANIA MORTGE. INV. CO.
BOX 6, SPOKANE, WASH.

253 ACRES OF NO. 1 RICE LAND FOR sale at $75 per acre. One good crop ought to pay for the land and all expenses. Water from 8 to 16 feet from surface, and canal running along side of land. $40 per acre cash; would take other property in exchange for balance, or on terms at 6 per cent. C. R. Suggett, College City, Caluza Co., California.

THOUSANDS OF ACRES OF FINE LAND. Irrigated, logged-off and general farming land; along the new lines of the Chicago, Milwaukee & St. Paul Ry. Write or call for free booklets. Immigration bureau, C. M. & St. P. Ry., 2nd and Cherry st., Seattle, Wash.

120-ACRE DAIRY FARM; 80 A. TILLable; 12 acres cultivated; 35 acres ready for plow; 5-room house, barn and outbuildings; 1 mile to town; price, including 9 milk cows, $4000; terms. O. V. Manring Investment Co., 22 Symons blk., Spokane.

WESTERN WHITMAN WHEAT AND PASture lands from $10 to $40 an acre. Values increasing. Write me about what you want, I shall try to locate you here. H. M. Moffatt, Winona, Wash.

MONTANA LANDS OF ALL KINDS, small payment; long time on balance. Can take good farm lands as part payment. Robert A. Hopkins, 617 First ave., Spokane.

SEE US IF YOU WANT TO BUY OR SELL farm lands. J. F. DEALY & CO., Spokane.

FARM LANDS—WANTED 654

MAYBE YOURS IS JUST THE PLACE WE ARE LOOKING FOR.
If you want to dispose of your ranch, please write us or better come in and tell us about it. We have several customers for wheat and stock farms. Perhaps yours is just the farm we want.

SEE US FOR ALL KINDS OF TRADES if your property does not suit you. Rogers & Rogers, Spokane.

NEWS FOR BREEDERS

A RECORD SHORTHORN YEAR.

The year 1916 will be written in history as a glorious one in the annals of the Shorthorn breed, says a writer in the London Live Stock Journal. Both the fashionably bred Scotch Shorthorn and the so-called dairy Shorthorn have upset all previous records, and although the blue riband of the Smithfield club has not this year gone to a specimen of the premier breed, yet adherents of both types of Shorthorn have every reason to feel thoroughly satisfied with themselves.

Is it not well, however, for the exponents of the two now almost distinct types to see whether they can not draw closer together instead of, as at present, drifting wider and wider apart? The conclusion to be drawn from the statistics of Shorthorn sales during this last year is that the boom in prices exists only in regard to animals of extreme types. The beef Shorthorn must be of the most fashionable Scotch blood and of the short-legged, thick, blocky type if it is to realize a fancy price, and, on the other hand, unless the good old English pedigrees are represented by animals with high milk records, or possess particularly good milk vessels, they fail to create much enthusiasm, and their market value is little, if any, above that of a good commercial cow with a good bag, many of which are fetching from $200 to $250 in local markets.

There was a time when a Shorthorn was a Shorthorn, and the only matter in question was as to whether the animal was of the Booth or Bates blood. Both sorts had good qualities and some bad ones, but there was not the vast difference in characteristics between the two sorts as there is between the beef and dairy types of today.

GRAND CHAMPION JERSEY.

Golden Fern's Noble, grand champion Jersey bull at the National Dairy show, 1916. One of the world's most famous sires.

FASHION IN BREEDING.

But since the days of Sittyton the pandering to fashion has steadily grown, and the onlooker can not help putting the question to himself whether we are not in danger of a "pure Cruickshank" craze which may carry us as far as the "Bates" craze of a former day, says J. R. Barclay in the London Live Stock Journal. It must be confessed that the catering for the foreign, and especially for the United States, market has led breeders far along the road to "fashion." There are no sticklers for pedigree like the United States breeders—a fact which has been seen quite as forcibly in Aberdeen-Angus as in Shorthorn matters. They scrutinize pedigrees with most critical closensss, becoming at times absurdly finical in their fads and fancies. Home breeders are not altogether free of this hypercritical taste.

OREGON HORSE BREEDERS.

It is the opinion of Professor Carl N. Kennedy, secretary to the Oregon Horse Breeders' association, that the best way to build up the horse business in the northwest is by the use of purebred sires and better methods of breeding.

The officers of this association are John Wells, Alisell, president; G. F. Burge, Albany, vice president; Carl N. Kennedy, Corvallis, secretary; Dr. J. W. Cook, Brownsville, treasurer. The directors are: J. P. Adkisson, Wasco; A. J. Eagan, Gervais; Gust Jaeger, Sherwood; William Ledbetter, Alisell; Clyde E. Niles, Grants Pass. The association publishes a list of purebred horses offered for sale by members of the association. This list can be obtained from the secretary, Carl N. Kennedy, Corvallis.

OREGON STOCK GROWERS.

La Grande, Ore., is making preparations for the meeting of the Oregon Stock Growers' Association April 24 and 25. This meeting is one that will draw stockmen from eastern Washington, Idaho and Oregon.

GROW OR BUY HORSES?

Farmers' Review:—It has been the constant recommendation of horse writers and speakers that farmers generally should keep mares and raise colts. It is certainly reasonable to argue that it is cheaper to keep mares and raise the colts than it is to buy them of some other farmer, paying a price that not only includes production cost but profit, and many examples can be presented of farmers who are making a very nice thing on growing colts. It has been our observation that farmers generally know what pays them best, and any practice of any considerable number of farmers, no matter how far wrong it may appear to the theorist, is worthy of our very serious consideration. In a communication from Secretary Dinsmore of the Percheron Society we find that "not more than 16 per cent of our farmers are raising colts." This leaves the colt raisers pretty sadly in the minority, and still we are told they are right, and that more farmers should raise colts. We don't say that the practice of the great majority of farmers in buying their work horses is correct, but nevertheless we do say the practice of any large number of farmers is worthy of our very serious consideration. Not all farmers who are not breeding mares are fixed so they can raise colts, but many of them are, and what we would like to know is, who's right?

HERO OF PERTH SHOW.

Veloz of Naemoor, the Shorthorn hero of the 1916 Perth show, realized $14,419 at Buenos Ayres, the buyer being Alberto Castell.

The sire of this 1915 bull is Edgecot Masterpiece, and his dam Newton Jealousy 4th, and he goes back on his madre's side to Jealousy, and on his padre's side to Lord Buckingham, Scarlet Velvet and Baron Warlaby. Duncan Stewart's King Cruishank, second prize winner at Perth, made $5939 to Senor A de Barry, and this bull boasts the blending of the brains and blood of such breeders as W. Duthie, W. S. Marr, A. M. Gordon, R. Chilton and Captain Barclay of Ury.

ASK LARGE PREMIUMS.

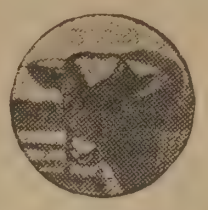
It is reported that a number of the leading livestock breeders of the northwest are considering asking fair associations to place larger premiums on exhibits next fair season.

Some of the breeders declare that it is impossible for them to go to the expense of fitting their stock for the shows without chance for a greater compensation in the form of premiums. Others express the opinion that the profit from the shows to the man who exhibits his live stock is in the advertising that he gets among those persons desiring to purchase good stock for breeding purposes.

NEW ZEALAND MEAT
British Contract for Exports.

Through the good offices of the New Zealand government the meat producers of New Zealand have entered into an agreement with the imperial British government for the entire exportable meat supply of this dominion from October 20 until at least three months after the close of the European war, at an advance price over that paid last year. The new prices, free on board steamer at port of shipment, are as follows, per pound:

	Cents
Wethers, first quality, 72 pounds and under	10¾
Wethers, first quality, over 72 pounds.	10¼
Wethers, second quality	10¼
Ewes, first quality, 72 pounds and under	9¾
Ewes, first quality, over 72 pounds..	9¼
Ewes, second quality	9¼
Lamb, first quality, 42 pounds and under	13
Lamb, first quality, 42 pounds and under	12¾
Lamb, first quality, over 42 pounds..	12¼
Lamb, second quality	12¼
Beef, prime ox	10
Beef, second and heifer	9½
Beef, boning, in quarters	8½
Beef, cow, prime	9½
Beef, cow, second	8½
Beef, boneless	10½
Mutton, legs	12¾
Mutton, shoulders	10¾
Mutton, loins	10¾



It is estimated that the increased price will mean about $5,000,000 per annum more for the meat producers of New Zealand, and this practically spot cash.

South African Paint Factory.

Earth pigments and ochers have been discovered near the Cape of Good Hope and South Africa's first paint factory has been opened.

Breeders' Department

By R. H. Rushton.

$7.50

Down *After*

30 Days Free Trial

Only $7.50 if satisfied after trial—then a few monthly payments

—and—

You Keep This Genuine Melotte

Write for catalog—it explains everything

Yes, sir, that is our offer on the world's greatest cream separator, the imported Belgian Melotte—the separator with the wonderful, self-balancing bowl. We are taking the lead. Let others follow if they will. Our catalogue explains. We say to you, "the world's greatest Melotte will give you *more cream*, bigger profits and greater satisfaction—*and*—it is up to us to prove it. You have a right to insist upon the proof when *anybody* makes claims for his separator." Read our offer.

Not a Cent in Advance

Just ask for a 30 day free trial. Then we ship the Melotte. No salesman, no agent calls; no one around to bother you or to influence you. You start using the machine according to every test you can think of. If you decide against it, all right—send it back *at our expense*. But—

If after thirty days you are convinced that the great Melotte is the cream separator for you, you can keep it on our rock bottom price offer—first payment is $7.50 after the thirty day trial, and thereafter just the same monthly payments. Send the coupon now for free catalog and full details of this offer.

Extra!

No Duty Now!

Save $15.25

The high tariff has been cut right off—the great Melotte comes in absolutely free of duty. Good for the American farmer! He gets the great Melotte Cream Separator at an extra reduction of $15.25!

The high tariff and patent arrangements have kept the Melotte out of reach of the American farmer. Now this handicap is off. You can get the world's greatest separator now without this excessive duty charge—and on our rock-bottom, direct offer

Wonderful Record

The Melotte has won more than 264 international prizes at Brussels, Vienna, London, Paris, Amsterdam, Milan, St. Louis, etc.

One Melotte has been running at Remincourt, Belgium, the equivalent of 54 years of actual work without appreciable wear.

Here is *one* great reason for Melotte superiority: The bowl is *self-balancing*—it hangs down from a single bearing and spins like a top. Can't get out of balance. The Melotte turns so easily that the bowl spins for 30 minutes after you stop cranking unless you apply brake. No other separator requires a brake to stop the spinning. *The Melotte is guaranteed for 15 years.*

Repairs—

are hardly ever needed on the Melotte on account of its self-balancing bowl—no repairs compared with other separators.

BUT—We have on hand repair parts for ten years ahead. That is the first thing we attended to, a huge stock of repairs when we introduced the Melotte in this country, and it has been a gratifying surprise that we are using hardly any of that stock.

Rock-Bottom Price!

Highest Grade Separator

WE offer you the Imported Belgian Melotte—the world's greatest cream separator—at the rock-bottom, before-the-war price: the same price charged in Belgium plus only $1.75 for water freight.

Seize this opportunity to get a highest grade separator on this astounding offer. You want a quality separator, one that you can be proud of all your life, one that will never bother you and that will always give you the maximum amount of cream without loss. So, we recommend to you the Imported Belgian Melotte—the separator with the wonderful self-balancing bowl that can not get out of balance and vibrate—especially now that we are making our rock-bottom offer. The Melotte is guaranteed for 15 years. Write at once, *while this offer lasts.*

Valuable Book Free

"Profitable Dairying". Send Coupon

The book is the work of B. H. Benkendorf, Wisconsin Dairy School-Agricultural College, Madison, Wis., and K. L. Hatch, Winnebago County Agricultural School, Winneconne, Wis. 88 pages. Contains no advertising whatever. A real, practical, commonsense treatise, telling everything about cows and dairying—how to feed and care for cattle—how to make more money out of your cows. Every farmer should have this book in his library. It is worth while getting now, even if you are not considering a cream separator at present.

We will send you this valuable book free upon receipt of the coupon. Also our new catalog describing fully the Melotte self-balancing bowl cream separator, and telling all about our rock bottom, 30 day free trial, easy payment offer. Send coupon while this offer lasts.

The Melotte Separator

Dept. 4341
Chicago, Ill.

Try Them All!

All the Makes on the Market

HERE'S a frank open suggestion:—

Have *every* manufacturer that is willing to give you a free trial, ship his separator to you.

If he is not willing to give you a 30 day free trial, ask him *why* he won't—get his *reason*.

Set them all up side by side, the Melotte and all the others, and then make the test. Keep a record of the results. See which skims the closest—which gives you the most cream. Figure out, on this basis, which will bring you the most profit. Notice which machine is easiest to operate—which is the least tiring. Then notice the construction. Which will stand the most wear? Which is most substantial?

We leave all this to your judgment. Look them all over. Analyze the results you get. Decide. Then keep the one which has proved best.

We're only *too glad* to have such a test of all machines together; then when you've bought the Melotte you'll be all the more a "booster" for us.

We are willing to abide by your judgment without a word. Remember the terms of our offer—if you want to return the Melotte, you may do so at our expense.

Don't buy any separator until after you have tried it 30 Days Free on your own farm.

Send the coupon at once for our Melotte catalog and the valuable book on dairying—no obligation.

THE WASHINGTON FARMER

SUCCESSOR TO
THE RANCH PACIFIC DAIRYMAN HORN AND HOOF

VOL. XL. FEBRUARY 1, 1917. ** NO. 5.

Washington Wheat Brings Farmers Fifty Million Dollars

The farms of the state of Washington produced crops last year (1916) having a market value of $128,950,000, according to the report of the United States department of agriculture. This does not include the valuation of live stock produced, nor that of dairy products, poultry, apiaries, truck gardens and the like, which in themselves run up into many millions of dollars in value.

The department of agriculture's reports show interesting facts regarding the production of wheat in Washington, showing it to have brought considerably more than one-third of the total income from the farm crops in the state last year. The large valuation of the wheat crop ($53,818,000 as calculated on the basis of prices on December 1) was due, not to increased production, but to the almost unprecedented high prices. The following figures illustrate: Total wheat yield of the state in 1916 was 37,635,000 bushels, as against 51,420,000 bushels in 1915, which shows a decrease of nearly 14,000,000 bushels. But the value was much greater than in 1915, when it was $42,165,000, as against the $53,818,000 for 1916.

In the value of farm crops as indicated, Washington's output of $128,950,000 places the state twenty-eighth in rank among the states of the union. Montana, with a valuation of $121,055,000, crowded Washington closely, ranking twenty-ninth. Oregon ranked thirty-first, with $105,474,000 crop valuation, and Idaho thirty-sixth, with $75,136,000.

Texas led all the states of the nation with a farm crops

(Continued on page three.)

Beware, Take Care.

"Beware, young man, take care,
"She's foolin' you

In the old days of lottery tickets, if a man won a high prize, that fact was good for the sale of hundreds of tickets in the neighborhood.

Popular opinion to the contrary notwithstanding, there is no man of any profession, vocation, or occupation that is possessed of more native shrewdness than the American farmer. Yet he sometimes falls down.

With fine stories floating all about us of twenty-thousand dollar wheat checks, and hundred thousand dollar wheat checks and quarter million dollar wheat checks, the head of even a farmer begins to whirl and grow dizzy and he is tempted to enter the wheat gamble.

I don't mean the Chicago pit or the Minneapolis Wheat Exchange. I mean he is apt to want to put all his money into wheat land, and all his land and equipment and credit into the wheat crop, betting, as it were, against the weather, and the smut, and the insects and the war and shipping and the manipulated markets, with the hope that he, likewise, will win a capital prize.

Why milk the cows twice three hundred and sixty-five times a year? Why carry slop to the pigs? Why bend the back to pick up spuds? Why carry a petty egg basket to market? Why, if by one big stake in wheat, one may become independent in a single year?

Never was there a time when the temptation was greater to desert the little old standbys that have helped out in so many a pinch. Never were the risks of doing so, so great. The seasonal risk is always great for the farmer. Pests are always to be counted on.

The farmer has the labor problem also.

To these difficulties we now have added the chances of war, flush times, free trade in agricultural products, increased cost of production.

Beware, take care. It's foolin' you.

Don't put all the eggs into one basket just now. Keep the old sow, and the old mare and old Brindle, and the young hens. Plant some of the same old crops that have done so well so many times.

Let the California special depart without you, and let the big automobile flash by, and watch the new piano go into Jones's house without a pang of jealousy.

"The race is not always to the swift."

E. A. Bryan

Costs Nothing

Money cannot buy a better story than "When Knighthood Was in Flower." But you don't have to buy it. We give it to you. If you did not begin it January 18, go back and begin it now.

THE NEW DE LAVAL

A Bigger and Better Cream Separator for the Same Money

THE FARMER who buys a De Laval this year will get bigger and better value for his money than ever before.

Not only will he get a better machine, a simpler machine, a machine that will skim even closer than any previous De Laval, but he will get a machine of larger capacity.

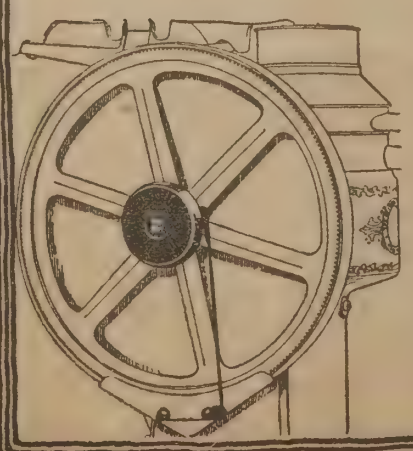
And the price has not been increased one cent.

Just think what that means to cow owners in the face of rising prices on almost everything else the farmer has to buy, including other cream separators.

Only the tremendous volume of De Laval sales makes it possible to give the farmer more for his money when others are giving less.

The NEW De Laval is the culmination of nearly forty years of experience and development by the largest and oldest cream separator concern in the world. It represents

The greatest improvement in separator construction in the last thirty years

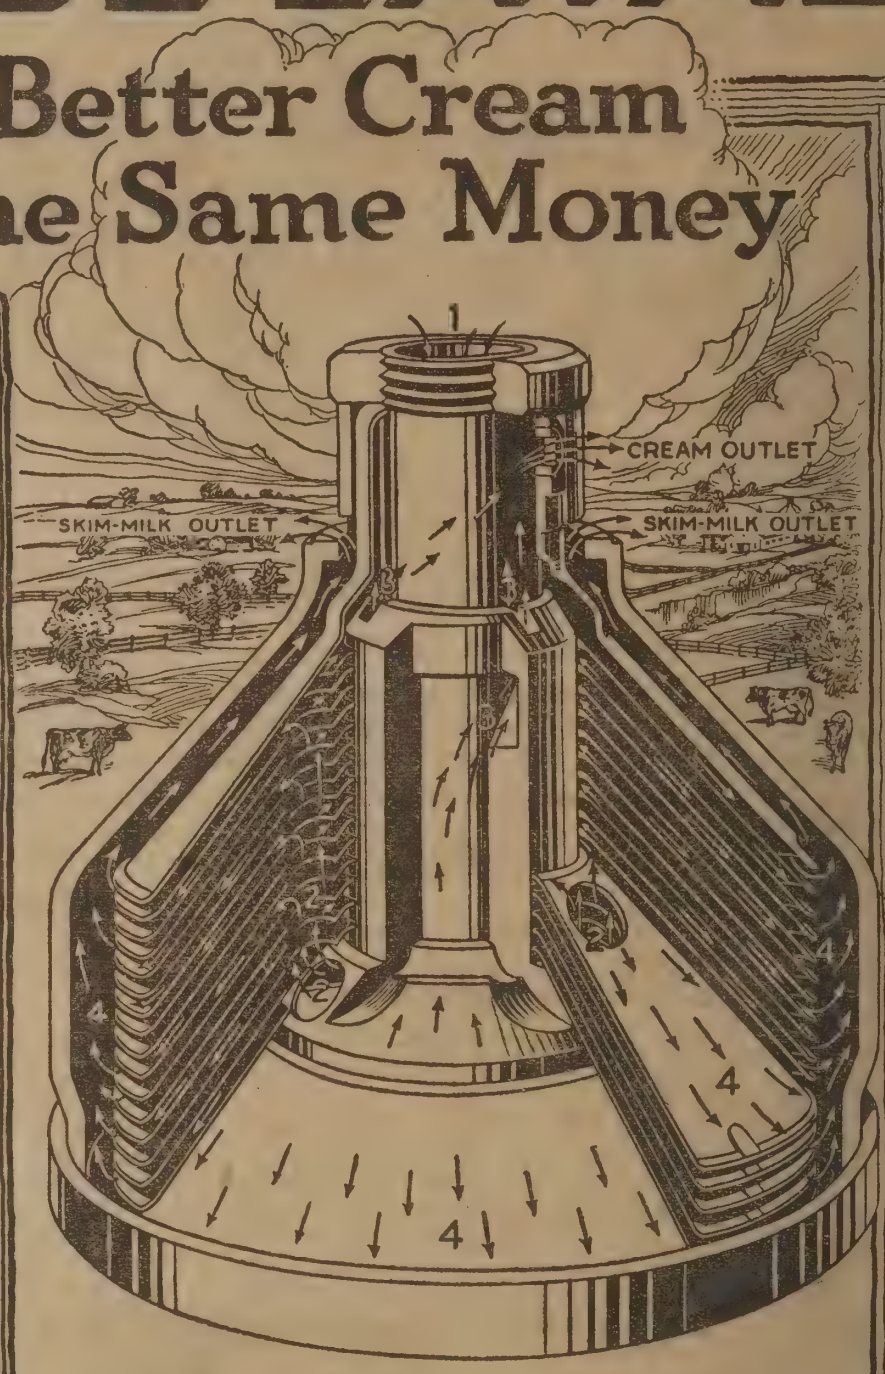


If you are trying to get along without a cream separator, or with a half-worn-out or unreliable machine, why not get a NEW De Laval NOW and stop your cream waste? You don't need to count the cost, because the De Laval will soon pay for itself.

There is a De Laval agent near you who will be glad to explain all the improvements and advantages of the NEW De Laval, and who will set and start a machine for you on your farm and let you try it for yourself.

If you haven't the spare cash right now, that need not stand in the way of your having the use of a NEW De Laval the rest of the winter. We have an arrangement with De Laval agents which makes it possible for any reputable farmer to secure a De Laval on the partial payment plan—a small payment at the time of purchase and the balance in several instalments—so that your De Laval will actually pay for itself while you are using it and getting the benefit from it.

Why not see the nearest De Laval agent at once? If you do not know him, writ to the nearest office for any desired information.



Every NEW DE LAVAL is now equipped with a Bell Speed-Indicator

The "Warning Signal" which insures proper speed and uniform cream

Because nine people out of ten turn the separator handle too slowly and because this always means loss of cream and cream of uneven thickness, every cream separator should be equipped with a reliable speed indicator.

Every NEW De Laval is now so equipped. The De Laval Bell Speed-Indicator is simple. It is accurate, it is reliable. There is nothing to wear out or get out of order. No matter who runs your De Laval, the "warning signal" will tell you when the speed is not right. You hear it and do not need to see it.

THE SELF-CENTERING DE LAVAL BOWL

Some of the points of superiority of the NEW DE LAVAL

The New De Laval bowl design and the new method of delivering the milk into the discs give increased capacity without increasing the weight or size of the bowl or increasing its speed. The incoming whole milk is delivered beyond the cream wall, and this, in conjunction with the improved design of the bowl, makes possible closer skimming than ever before, especially under the more difficult conditions of separation, such as skimming a very heavy cream or separating milk below usual temperature.

The much lower speed of the De Laval than other cream separators (in most cases from one-half to one-third less) insures minimum wear of gears and much longer life of the machine.

The New De Laval concave-bottom, self-centering bowl is so designed and so supported by the detached spindle that it will run true and do perfect work even after long wear, the great importance of which every separator user will appreciate.

There are fewer discs in the New De Laval bowl, and all disks are unnumbered and are interchangeable.

By reason of its simpler construction and the fewer number of discs, the New De Laval bowl is more easily washed and cleansed.

All New De Lavals are automatically oiled, every moving part of the machine being bathed in a constant film of oil. There are no oil holes anywhere on the machine, and the sight feed oil cup on the top of the frame provides for a constant supply of fresh oil.

The gears, pinions and other moving parts of the De Laval are exceedingly simple in arrangement, substantial in dimensions and always interchangeable.

The De Laval tinware is sturdy and heavily tinned, well suited for long and hard wear, and easy to clean.

The low speed of the De Laval bowl, in combination with greater capacity for a given size and weight of bowl than is found in other separators and the automatic De Laval oiling system, make the De Laval the easiest cream separator to turn.

New Catalogue will be mailed upon request

Trading Company Fraudulent?

Trial of Its Officials Is Begun in Federal Court in Spokane

With a jury sworn, including four farmers in its membership, the case of the United States against the five former officers of the Northwestern General Trading company began last week in Spokane. The specific charge against the five men is that they conspired to use the mails for fraudulent purposes, the alleged swindling of stockholders and prospective stockholders in the Trading company, the bulk of such holders being farmers of Washington and other states.

Defendants Well Known.

The defendants in the case are Gale Smith, original promoter and president of the Northwestern General Trading company; Olin C. Fowler, treasurer of the company; C. L. Davies, treasurer and later manager of the company's branch at Portland; S. T. Knudson, sales manager of the Northwestern and later in charge of stock sales of the Olympic Trading & Supply company, and John C. Lawrence, one time candidate for governor, former public service commissioner, and head of the organization department of the Northwestern General trading company when it went into bankruptcy.

What Letters Indicate.

Of special significance in the case against the former officials of the defunct Trading company was the reading into the court records of a series of letters which indicate the methods followed in selling stock and making collections for it. In most instances the letters were written by Frederick R. Sears of the company, since then deceased, to other officers or to stockholders.

In one letter to C. L. Davies, treasurer of the Trading company and now one of the defendants, Sears, apparently referring to the consolidation of the Trading company with the Farmers' Union Warehouse and Supply company of Spokane, wrote: "We certainly put over a big deal for the company last week." In another letter, referring to refusals of stockholders to pay for their stock on the ground that they had been induced fraudulently to subscribe for it, he said to Mr. Davies, whom he addressed as "Dear Clyde," "However, you know how we do it over here, make them toe the mark and come through with the dough."

Stockholders Threatened.

One letter written to a stockholder, who was about to refuse to pay for his stock, is cited as explanation of what the writer meant by making them "toe the mark." The letter threatens the stockholder with suit to enforce collection, and declares that if such suit should fail to bring sufficient judgment to meet the claimed obligation, statutory proceedings would be started involving both the stockholder and members of his family. This letter as made a part of the record at the time of the indictment against the Trading company officials reads as follows:

"Spokane, Wash., June 1, 1914, J. H. Anderson, Bigger, Sask., Canada: Evidently you did not appreciate the gravity of the situation existing in the above case, else you would have paid attention to our former letters. The papers in the case are even now with our attorney for action. The next notice, therefore, will be a summons from the court.

"The attorneys' instructions are to take whatever legal action is necessary to secure payment of this account, to begin suit in garnishment, attachment or otherwise, immediately. Reduce the claim to judgment and issue execution to the sheriff or constable commanding him to seize all property and dispose of it at auction and to apply the proceeds to satisfy said judgment.

"Should the sale of your goods fail to produce sufficient funds to liquidate the claim, he is instructed to follow with statutory proceedings in aid of execution, wherein you and members of your family are called as witnesses, and in open court put through a most rigorous cross-examination as to your belongings. Were it possible for these proceedings to fail of their purpose there is still left a national bankruptcy act, which the United States administers, and you know what that means.

"It is too late for promise unless accompanied by a payment and a definite arrangement for settling the balance. Should the said payment not reach the plaintiff until the date set for suit (10 days from date), he can stop action by telegram.

"Do not permit yourself to think we will let you escape the just penalties of your dilatory and indefensible action. It is well for you to know also that in order to protect its members against loss through bad accounts it is the rule of the association to place the names of those who refuse to pay their just debts upon a delinquent debtors' list and place this information at the disposal of all members of the association in the county where you reside."

Used Grange Indorsement.

A letter to an Idaho stockholder by Mr. Sears indicates the use made of the indorsement by a committee of the grange and farmers' union in furthering the work of the company. In this letter the assertion is made that the company is in flourishing condition during a time in which the government attorneys declare it was constantly losing money. The letter follows:

"SPOKANE, Nov. 10, 1914.—Mr. Crab, Saywer, Idaho.—You understand this is a cooperative company issuing catalogs to members only. The membership numbers at this time nearly 8000 of the most progressive and enterprising people of this Inland Empire. By far the greater portion of these people are trading with the company, buying their merchandise, clothing, hardware, groceries, shoes, farm implements, vehicles, wagons, etc., through the company and report a saving of from 25 to 35 per cent on practically all kinds of merchandise. The company has prospered very rapidly, and in five years the membership has grown to nearly 8000 and the total assets to a third of a million of dollars, and the stock is selling for $75, nearly four times its original value.

"You will notice by the enclosed circular the executive heads of the Washington Farmers' union have investigated the company, its management and system of business very thoroughly and have unanimously indorsed the proposition. This of itself is going to enhance the value of the stock and should double the membership. The state grange of Washington also took the same action and unanimously indorsed the company. Five shares is the most we can sell to one person and represents an outlay of only $375 and makes you a part owner in the Wholesale Mercantile company that is today in the foremost rank of any institution of its kind in the west and getting larger every day. Northwestern General Trading Co."

San Francisco Judge Presides.

United States District Attorney Garrecht, conducting the prosecution, is assisted by H. S. House, a special examiner for the department of justice, and J. S. Swenson, postoffice inspector. These men spent nearly a year on the books and files of the trading company.

Federal Judge William C. Van Fleet of San Francisco is hearing the case, which will probably occupy three weeks.

F. C. Robertson appears as counsel for all of the defendants, while P. W. Kimball appears for Lawrence alone.

Charges of Fraud.

District Attorney Garrecht opened the case in the federal court room by outlining the history of the Trading company from the date of its organization in 1909 to the time it went into bankruptcy in 1915, after preying upon the credulity of grange and farmers' union members and other farmers and individuals, according to the attorney's claims, to the extent of heavy losses to them.

He declared that the company lost money every year, but that it nevertheless sent out stock salesmen with

(Continued on page eighteen.)

Following is the personnel of of the jury which will decide the guilt or innocence of the men charged with fraud in connection with the operation of the Northwestern General Trading company:

John Cassaday, Ritzville, hardware merchant.

B. B. Gillespie, Ritzville, farmer.

P. L. Fowler, Ritzville, electrician.

William E. Hall, Spokane, with Ryan-Newton company.

J. W. Mackey, Spokane, accountant with Washington Water Power company.

Christ Haag, Ritzville, farmer.

Lou Hunt, Spokane, former proprietor of Lou Hunt's soft drink parlor.

David Gorman, Spokane, real estate broker.

A. E. Keaugh, Colville, farmer.

William Coddington, Spokane, with Fidelity National bank.

Henry Kimbel, Spokane, farmer.

A. P. Fassett, Spokane, retired.

E. F. BENSON.

Announcement has been made at Olympia that E. F. Benson of Tacoma has accepted the position of state commissioner of agriculture as offered some time ago by Governor Lister. Mr. Benson takes a place which has not been filled by a regular appointee since the resignation of J. H. Perkins of Ritzville two years ago. Since that time H. T. Graves, deputy commissioner of live stock in the department, has been acting commissioner. The newly appointed commissioner is one of the leading men of the state in farm development, especially in matters of irrigation and dairying.

Washington Wheat

Brings to Farmers Fifty Millions

(Continued from page one.)

total of over $684,000,000 or approximately one-thirteenth of that of the entire United States. Iowa was second with $516,000,000 and Illinois third with $478,000,0000.

The total farm crop valuation in the United States, exclusive of live stock, dairy, poultry and the so-called minor products, was last year approximately $8,934,000,000. The nation's live stock and live stock products, which include dairy and poultry, totaled about $4,338,000,000. These two enormous totals, together with the government's estimates on the many minor farm products, bring the grand total of value produced on the farms of the country in 1916 up to $13,449,000.000.

The following table shows the valuation of farm crops, which it must be remembered does not include live stock, dairy, poultry and the like, by states, showing also their rank from the standpoint of this valuation:

State:	Value. 1916.	Value. 1915.	Rank. '16.
Maine	$89,237,000	$58,076,000	32
New Hampshire	26,237,000	19,443,000	43
Vermont	42,782,000	39,262,000	40
Massachusetts	50,621,000	46,811,000	38
Rhode Island	5,408,000	5,102,000	48
Connecticut	42,192,000	30,832,000	41
New York	293,329,000	267,725,000	8
New Jersey	79,326,000	58,360,000	35
Pennsylvania	299,408,000	232,406,000	7
Delaware	17,847,000	12,362,000	46
Maryland	87,001,000	68,905,000	34
Virginia	215,886,000	152,703,000	21
West Virginia	87,262,000	68,945,000	33

More Credit for Farmers

How Federal Farm Loan System Can Help

The Farmer begins this week a second series of articles on the federal farm loan system. They will be written by N. W. Durham, chairman of the joint committee of representatives of the grange, the farmers' union and the chamber of commerce that presented Spokane's application for one of the 12 farm loan banks. These articles will explain in detail such phases of the law as—

Permanent organization of the federal land banks. At first they will be managed by five directors appointed by the national board. But a little later the management of each bank will pass to nine directors. The farmers, through their farm loan associations, will choose six and the government will name three.

Duties and powers of the officers of the farm loan associations.

How the loans will be made.

The amortization feature of the mortgages—the plan by which the borrower pays off a little of the principal every year and finds, when the final interest payment is made, that the principal of his debt has melted away.

How farm lands will be apraised for prospective loans.

Joint stock land banks. Should the law be amended to cut them out?

Farm loan bonds. How issued, how secured, and their attractiveness as investments for big investors and little savers, including the thrifty boys and girls out on the farm.

Incidentally many other provisions of the law will be discussed.

Interest Keen in Loan Bank

Appointment of Directors Anxiously Awaited

By N. W. DURHAM

This is the first article in Mr. Durham's second series on the organization and operation of the new federal farm loan banking system.

News is anxiously awaited of the appointment of the five directors who will organize the Spokane federal farm loan bank and start the business of making long-time, low-interest mortgage loans to the farmers of Washington, Oregon, Idaho and Montana.

Meanwhile farmers all over the country are showing keen interest in the operation of the new system. Many are seeking information, and the Farmer herewith begins a new series of farm loan articles that will cover much ground not previously worked.

Briefly speaking, there are three main divisions of the system:

1. The federal farm loan board of five members who were named by the president.

2. The 12 federal land banks scattered throughout the nation. Two of these banks have been placed upon the Pacific slope—at Spokane and at Berkeley, Cal.

3. The many national farm loan associations, each made up of 10 or more farmers, who propose borrowing from the federal land banks.

Each bank starts with a capital of $750,000, but it gets additional money for lending by automatic increases in the capital stock and by the sale of its bonds.

The system is organized to grow like a rolling snowball. A bank loans out its first $750,000. It then holds $750,000 in mortgages. With these mortgages for security it issues $750,000 in bonds and sells them in the open market to small and large investors. That gives it another $750,000 to loan out on more mortgages, and these additional mortgages are made the security for more bonds; and thus it rolls along like an endless chain, the only limitations being the number of farmers who want to do business with the system and the number of people who stand ready to buy the bonds.

Farmers contemplating the organization of local associations need not wait for the opening of the Spokane bank. They should write to W. W. Flanagan, secretary of the federal farm loan board, Washington, D. C., for definite instructions and the necessary organization blanks.

A farm loan association may be organized in any community where 10 citizens owning land desire to borrow an aggregate of not less than $20,000. The land must be unencumbered, or the proceeds of the loan must be used in part or in whole to remove any existing debt or lien. This means that if your farm is already mortgaged you can borrow money from the government system to lift the old mortgage.

Loans may be as small as $100 or as large as $10,000.

Let it be plainly understood that farmers can organize at once, but they can not borrow money until the land banks are established.

The national farm loan associations are not limited as to the number of their members. After one is organized it may serve an entire neighborhood by receiving new members.

No loan may be made except upon the security of first mortgage.

The amount of the mortgage can not exceed one-half the appraised value of the land and 20 per cent of the permanent insured improvements thereon.

The money thus borrowed from the farm loan bank must be used to pay off prior indebtedness or for productive purposes, such as the purchase of live stock, fertilizers, equipment and improvements.

Every mortgage must contain an agreement to pay off the debt (principal and interest) in fixed annual or semi-annual instalments.

The amount of each instalment may be fixed by the borrower, but can not be less than sufficient to pay off the debt in 40 years, nor greater than to pay it off in five years.

The rate of interest charged any borrower can not exceed 6 per cent per annum.

The borrower can not be called upon to pay the debt except by the instalments he originally fixes, unless he defaults, but after five years he may pay off the whole or any portion at his option at any instalment period.

The second article in this series will appear in next week's Farmer and will discuss the permanent organization of the farm loan bank.

AT EUGENE, OREGON
Lane County Loan Association.

The first national loan association of Lane county has been organized at Eugene. Its jurisdiction extends all over Lane, Lincoln, Benton, Linn, Deschutes, Klamath and Douglas counties. Application for loans are reported from all of these counties. It has seemed advisable to have one central organization for a large district with a salaried secretary-treasurer. It is expected that a dozen or more local organizations will be formed in these counties as soon as the farmers discover the advantages of the new financial system. The first national farm loan association is ready and willing to assist the farmers to organize nearest their homes. This association now has applications for farm loans aggregating above $200,000. Already a temporary organization has been formed at Florence, Lincoln county, with C. Buchanan, the postmaster, as president, and H. L. McKee, secretary-treasurer.

REDMOND FARMERS
Organize Farm Loan Body.

Twenty-three farmers recently gathered in the county agent's office at Redmond, Ore., to consider the matter of forming a national farm loan association.

A board of five directors was elected to carry on the preliminary work of the association, the election of officers being delayed until a later date. The directors were Earl Benton, F. A. Rice, W. T. Maddox; C. R. McLallin and J. E. Bourmaster, all of Redmond.

LONG TIME LOANS
Satsop Association Organized.

A national farm loan association has been organized at Satsop, Wash., with C. B. Sherwood, master of the local grange, as president; W. H. Hay, vice president, and E. L. Brewer, secretary-treasure. A number of additional farmers are expected to take advantage of this opportunity to get long time loans as soon as the association is in working order.

Difference of 45 Cents

How Many Leaders Ought Apple Tree to Have?

By PAUL E. TRIEM

If there is an average difference of 45 cents per box between C grades and extra fancies, how many leaders ought an apple tree to have? Perhaps at first glance there may seem to be no connection between these two sets of facts, but a little thought ought to show you that there is a close connection. Extra fancy apples come principally from the leader. This is because of the abundance of sunlight and air secured to the apples grown on this part of the tree. In the old days of apple culture, each apple tree was pruned with one leader, which formed the center and tip of the tree. According to this system of pruning, there could be but a limited number of fancy apples produced to the tree.

By substituting for this one leader system another in which from three to five leaders, equally disposed around the tree, are secured, the percentage of fancy and extra fancy fruit is greatly increased. This is the experience of many apple men, among them L. Maclean of Otis Orchards, Spokane county, Wash. Mr. Maclean believes in getting less and better fruit, for by this method he is able to make a satisfactory net profit with the least possible perplexity in regard to C grades and culls, which are always the most unsatisfactory apples to sell at a profit.

In carrying out this principle, the Maclean orchards are pruned twice each year. Mr. Maclean does not pay much attention to the theory that winter pruning encourages wood growth, while summer pruning increases the number of fruit spurs. He prunes a tree to free it from superfluous and unprofitable wood, keeping always in mind the fact that fancy and extra fancy fruit means plenty of open space in the tree, for the free entrance of air and sunlight.

Handling the Soil.

Another break with tradition in the Maclean cultural methods comes in connection with the handling of the soil. We have been told for years that the only scientific system was that of clean culture, which left a surface mulch and turned under every weed and spear of grass. Mr. Maclean admits that this sounds right and that such an orchard looks pretty, but after studying a comparison of two adjacent orchard tracts, each of ten acres, one of which was kept in dust mulch and the other in clover and alfalfa, which was allowed to lie on the ground, he has adopted the latter system. In the spring the alfalfa is chopped into the soil with a disk harrow. This furnishes a mulch, secures much nitrogen from the air and insures a liberal supply of humus.

"And with it all," Mr. Maclean admits, "the prospective orchardist should not expect to have a cent to spare during the first ten years. He should plan, rather, to put all his earnings back into his plant. The first ten years go to building up the manufacturing side of the fruit business—to getting sturdy, properly shaped and well fed trees, with great bearing capacity so distributed as to give a large percentage of fancy and extra fancy apples. The next ten years will have to be devoted to building up a distributing system. These facts are too often overlooked by the man who plunges into the apple business expecting to realize a cash profit almost from the start. If he handles his business in the right way, his surplus, his real earnings, will be represented largely by the increased productivity of his trees from year to year. If a leader which was a mere twig last year is as large as your thumb or even your wrist now, you have secured a profit, even though it isn't in the form of cash."

MORE WEED SEED
Samples Are Tested at Bozeman.

Farmers and grain dealers of Montana during the year 1915-16 submitted 5035 samples of seeds to the state grain laboratory at Bozeman to be tested for germination and purity, according to a report just made. The statement indicates that Montana agriculturists show greater interest in seed quality than farmers of most parts of the United States.

There are 63 such laboratories in the United States and their reports cover 800 to 1200 samples a year. Only one, the Minnesota state grain laboratory, handled more samples this year than did the Montana state laboratory.

The report of the Bozeman laboratory calls attention to the fact that the amount of weed seed found in seed samples has steadily increased during the last three years. Thus the percentage of alfalfa seed samples containing mustard seed increased from 7.6 per cent in 1915 to 8.8 per cent in 1915, and 17.2 per cent in 1916. The number of alfalfa seed samples containing Russian thistle seed increased from 34.9 per cent in 1914 to 45.6 per cents in 1916 and 62.1 per cent in 1916.

NEW ROAD OPENED
South Bend-Raymond Boulevard.

By Mrs. Winnifred Buckingham.

The South Bend-Raymond boulevard, in western Washington, which has been under construction for over three years, was opened for traffic in January. This road is level and follows the river, also the Northern Pacific railroad tracks for four miles between the two cities. It is surfaced with concrete. The opening of this road means a great deal to the valley farmers, for it enables them to go to South Bend, the county seat, as well as Raymond, to do their trading and to sell their produce. The old county road is circuitous and lies over high hills and needed repairing so badly that few farmers ventured over it during the past three or four years.

Live Farmers in Wahkiakum

Diking Under Cooperative Effort Redeems 3000 Acres of Richest Land

By H. H. BUSHNELL

Wahkiakum county is down along the lower reaches of the Columbia river. Because of the natural difficulties of building roads to the rest of the world, its communication with trade centers is chiefly by boat. It is an old county and a little bit isolated, but it has found within itself the inspiration of growth.

The first settlement in the county was probably Cathlamet. It is said that Lewis and Clark stopped there; at all events, the Hudson Bay company established a trading post and fort there, and the building still stands close to the water's edge. In later years Phil Sheridan was on duty at Cathlamet.

Cathlamet stands on the shoulder of the great hills which hem in the mighty river, and overlooks the expanse of water so rich in the treasure of fish—a treasure which has made many men rich and supports an army of workers.

Wahiakum county was the first county of the state to decide to have a county agriculturist, and it picked a good one and he suits, for he continues the work he started. George A. Nelson was born in California, came to Oregon a number of years ago, lived in a similar climate across the river, attended Oregon Agricultural college and is now in his fifth year of service in Wahkiakum county. He has a wife, three sturdy, rosy children, a Ford car and a farm which some day he will make blossom like the rose.

"Dairying is the principal industry of this county," said Mr. Nelson, "and so our main work is along the line of dairying."

The greatest achievement of the agriculturist here has been diking. Puget island, out in the river, but a part of the county, has been diked. The work will be completed in March probably and on this and a smaller adjoining island 3000 acres of land will be redeemed—the richest land in the world with the possible exception of beaverdam. Nobody can know the patience and hard work and argument and effort necessary to get the people affected to combine to do this work unless he has tried it. And yet Mr. Nelson did accomplish it. The expense of diking on the island is heavier than it would be on the mainland. It amounts to about $35 an acre. Most of the Puget island people are fishermen by calling, but it is likely that they will be farmers in the course of time. A larger project embracing land almost the entire distance from Cathlamet to Skamokawa is under way.

It was suggested to Mr. Nelson that this redeemed land would raise fine truck crops. He agreed that it would, but said that there was no sufficient market for such crops as yet—Portland is too far away for a sufficient market for as much as could be produced. For the present the land should be utilized for dairy operations.

Extension Work.

On the week commencing January 8, Miss Mary E. Sutherland and Professor James N. Price, both of the extension service of the state college at Pullman, visited the county and lectured through the county, visiting Rosburg, Grays River, Deep River, Cathlamet, Skamokawa and vicinity and Alokoman. Both had lectured here before and they were welcomed not only as experts in their line, but as friends.

I was able to attend a few of the meetings, among them the gatherings in West Valley and East Valley, out from Skamokawa. I presume they were fairly representative.

On Thursday of that week County Agent Nelson, Professor Price and the writer entered Mr. N's car and started from Cathlamet to Skamokawa. About a mile of the road had not been grav-

Subscription price: $1.00 a year—3 years $2.00.
Canada and foreign, 1 year $1.50.

OUR GUARANTEE TO SUBSCRIBERS.

Any subscriber who does not feel that The Washington Farmer is worth to him all and more than the subscription price may order the paper discontinued and the unusued portion of the amount paid for the subscription will be refunded. You must be satisfied.

Entered as second-class matter January 13, 1916, at the postoffice at Spokane, Washington, under the act of March 3, 1879.

GUARANTEE OF ADVERTISEMENTS.

We guarantee every subscriber against loss through dishonesty or swindle by any advertiser in this publication; we do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Complaints must be sent us within 30 days from the date of the transaction, and the subscriber must have mentioned The Washington Farmer when writing the advertiser. This guarantee applies to live stock, except that we will not be responsible for claims for damages on account of disease in stock sold through these columns.

Train the Boys for Business

The extension department of the Montana state college in a bulletin recently issued, urges upon the farmer and stockman the absolute necessity of training the boys systematically and scientifically that they may be able to continue the development of the industry started by their fathers and their fathers' fathers.

"In order to develop the live stock business as it should be developed," says the college statement, "boys should be trained and developed in live stock work.

"The foundation and starting point for the boy is live stock judging. This work teaches the type of market animal that will sell to the best advantage and why type or kind of animal is in most demand. It also teaches how to select the breeding animals to produce both breeding and market stock to the best advantage—the kind that will bring top prices; that will make most economical use of their food; and the kind that will give pleasure and satisfaction to the producer."

Production and Price

The Saturday Evening Post comments editorially on the fact that the production of grains in the United States in 1916, while a billion bushels less than in 1915, brought on the market about $800,000 more money, farm value. "That smaller production means more money to the producer is an old story," says the Post.

If that story is true, as well as old, it may seem that it behooves the farmer to cut down his acreage, eliminate the expense of tilling the soil and harvesting large crops, and get rich with small crops and little labor, the smaller the richer. Sometimes the story is true. Sometimes small crops and high prices go hand in hand, but sometimes they do not, and until human nature is completely revised the higher goes the price the the larger the acreage of the following year will become. No farmer is going to cut down his acreage to half because he believes by so doing he will double the price that he will receive. Recently President Wilson urged the farmers to increase their crops, and a prominent economic scientist of New York warned them against it. Both bits of advice are futile. Nature gives the only advice that will be heeded.

Ability Must Be the Test

The members of the federal farm loan bank board have laudably announced that politics will not be considered in the selection of officers in the newly authorized loan institutions, one of which is to be placed in Spokane for the service of the northwest.

"It may be stated without qualification these jobs will not be handed out as political plums. The only consideration which will be taken into account is that of merit, efficiency and ability. There is no division of opinion among the members of the board as to this principle," says a statement issued.

Too much criticism must not be heaped upon an administration for favoring those men who have been especially loyal to it. Such favor is but a manifestation of return loyalty. But the administration's duty is to the mass of the people first, and for this reason the bank board is right in declaring that "merit, efficiency and ability" will be the basis for selecting men to conduct the branch banks.

For each bank the board is to name fiye directors, from whom a president, secretary, treasurer and vice president will be chosen as managing officers. In addition, there will be for each bank a registrar to act as fiduciary agent of the government.

Should Examine Stock Schemes

Need of more vigilant state examination of stock-selling concerns and stronger safeguards for the investing public is the outstanding lesson of the wrecking of the Northwestern General Trading company of Spokane.

Officers and employes of that company are now on trial in the United States court at Spokane for conspiracy in the use of the mails by which 8000 stockholders, largely farmers of the Pacific northwest, suffered losses aggregating several hundred thousand dollars.

As these men are now on trial it might be improper for the Farmer to express an opinion as to their guilt or innocence, but the records as examined in open court do prove beyond question that even though no criminal intent existed, the company was managed on wrong and ruinous business methods. Although it was steadily losing money the managers went on boosting the price of the stock, paying large salaries and allowing big commissions to the agents who were out pedding stock.

By securing the official signed indorsement of the company and its methods from C. B. Kegley, master of the Washington state grange, and L. C. Crow, state president of the Farmers' union, the company was enabled to conduct an active stock-selling campaign among the farmers of the Pacific northwest. Granting that these officials of the grange and the union had no improper motives and honestly thought the concern was on a sound business basis, the need of a better system of state regulation and inspection becomes all the more apparent. For if these officials, with their exceptional opportunity of looking into the business, could be misled into thinking the stock was a safe investment to recommend to farmers, what possible chance existed for the individual investor to learn the facts?

It is fortunate that the federal government turned its searchlight on the methods of the Northwestern General Trading company. If Uncle Sam had not started an investigation it is probable that the facts would never have been brought to light, and the farmers of this section would have been lured into far greater losses.

Revel in Extravagant Habits

Senator McCumber of North Dakota gave the country some wholesome truths in a speech before the senate the other day. He spoke against the proposed embargo on farm products and took occasion to condemn the profligacy and extravagance of the American people that are driving many of them to whimpering when it comes to paying the farmer fair prices for the products of his toil.

The high cost of living, he said, is largely due to extravagance, and he cited figures to show that Americans spend $13,000,000,000 annually for liquor, tobacco, automobiles and other amusements.

The North Dakota senator is not alone in his arraignment of the nation's growing passion for display, indulgence, pleasure and entertainment. Former President Eliot of Harvard notes with concern the prevailing trend and calculates that the nation is spending more for liquors, tobacco, chewing gum, the "movies" and other indulgences than it is putting out for food.

"This revelry in extravagant habits," he said, "this unquenchable demand for amusements, for continuous mental intoxicants, is undermining the sturdiness of our younger generation. The American people seem obsessed with the idea that the main thing in life is amusement, play, entertainment."

In conclusion he said that an embargo on food, in view of present prices of farm, labor and articles used on the farm, in addition to land values, would be most unjust and class discrimination.

Peace and Good Will

This sounds like a Christmas subject, but it is a subject which might profitably be brought up at any time of the year.

It seems to us that no true peace can come without good will. Until we feel right toward our neighbors there can be no lasting amity. We may have armed neutrality, and the weaker party may fear to attack the stronger, but the basis of real peace is good will.

Washington Gleanings

The Pacific Fruit and Produce company has paid during the year $568,396 to growers of the Yakima valley, as against $302,284 last year.

The Clark county prune crop of the last season is said to have amounted to seven and a half million pounds and is valued at more than a half million dollars.

The Deer Park Lumber company has purchased the Coulette Ford timbered allotment on the former Spokane Indian reservation in the vicinity of Chamokane creek, near Miles, Wash.

The residents of the Touchet district have organized a good roads association. W. G. Cordiner has been named president. M. M. Gaiser, vice president and H. H. Hanson, secretary-treasurer.

The Kennewick-Richland marketing union reports that the berry and potato growers all over the valley are lining up nicely with even a better and more solid membership than it had last year.

Ralph Fenton, a big wheat rancher near Goldendale has offered to donate $10,000 toward the building of a hard surface road from his place to Golden, seven miles away, according to the White Salmon Enterprise.

Having met its obligation to sign 7500 acres for sugar beets for the Utah-Idaho Sugar company, the commercial club at North Yakima has set a new mark at 10,000 acres and will launch a campaign immediately to get the additional acreage.

The Sound dairymen, who formed a company and bought several hundred acres of land on the highlands west of Richland, are calling for bids from local people for grubbing, leveling and fluming 300 acres that will be planted to alfalfa in the spring.

The Sunnyside crop reports for 1916 shows that the project has broken all records both in total value of products and in the average returns per acre. The total of the 1916 crop is $4,341,940, making an average of $73 per acre for the 59,449 acres from which a crop was taken this year.

What Others Say.

Southern Agriculturist: Stand up; don't be a leaner.

Farmers' Review: Let town and country cooperate—not fight.

Farmers' Mail and Breeze: Clouds dark and lowering hang over this old world just now, but the sun, I think, is still shining somewhere behind them.

Hoard's Dairyman: We do not believe it is profitable for a farmer to equal his hired man in manual labor. He should take the time to manage his farm.

Wallace's Farmer: Ultimately, the United States will have to bear its share of the burden of this war, but very likely for a year, and possibly for two or three years, after the war ends, we will continue on the high tide of prosperity, to be followed by a period of depression lasting for a number of years.

Is Nation's Food Supply

Keeping Pace With the Growth of Population?

Interesting questions arise as to whether the domestic supply of the nation is keeping pace with the growth in population and as to what are the prospects for the future, says Secretary of Agriculture D. F. Houston, in his annual report. The following table in this connection is illuminating:

FOOD SUPPLY OF THE UNITED STATES.

Population.

June 1, 1900	75,994,575
June 1, 1910	92,174,515
June 1, 1916	101,882,479

Item.	Total Production.	Per capita.
Meats: Beef, veal, mutton and pork (pounds):		
1899	18,365,000,000	248.2
1909	19,712,000,000	213.9
1915	22,378,000,000	219.6
Dairy products: Milk (gallons)—		
1899	7,265,804,304	95.6
1909	7,466,406,384	81.0
1915 (estimated)	7,696,844,000	75.5
Butter and cheese (pounds)—		
1899	1,790,097,244	23.6
1909	1,942,378,069	21.1
1915 (no data available)		
Poultry products: Poultry raised — (number)—		
1899		
1909	488,500,000	5.3
1915 (estimated)	555,500,000	5.5
Eggs (dozens)—		
1899	1,294,000,000	17.0
1909	1,591,000,000	17.3
1915 (estimated)	1,811,000,000	17.8
Fish (pounds):		
1900-1904	989,275,000	12.5
1908	1,046,541,000	11.6
1915 (no data available		
Cereals: Corn, wheat and rice (bushels):		
1899	3,333,868,710	43.9
1909	3,257,407,468	35.3
1915	4,094,986,999	40.2
Potatoes (bushels):		
1899	273,318,167	3.6
1909	389,194,965	4.2
1915	359,103,000	3.5
Sweet potatoes (bushels):		
1899	42,517,412	.56
1909	59,232,070	.64
1915	74,295,000	.73
Citrus fruits: Oranges, lemons and grapefruit (boxes):		
1899	7,075,557	.093
1909	23,447,044	.254
1915 (estimated)	24,670,282	.272
Orchard fruits: Apples, peaches and pears (bushels):		
1899	197,455,620	2.6
1909	190,433,327	2.1
1915	304,686,000	3.0
Small fruits (quarts):		
1899	463,218,612	6.1
1909	426,565,863	4.6
1915 (no data available)		
Sugar (pounds):		
1899	486,006,871	6.4
1909	1,688,390,143	18.3
1915	2,025,680,000	19.9

These statistics cover the past 16 years, within this period the population of the nation has increased, in round numbers, 26,000,000, or 33 per cent. The articles dealt with cover the more important parts of the diet of the people. Meats and dairy products constitute 37 per cent of the average diet, fish 2 per cent, cereals 31 per cent, Irish and sweet potatoes 13 per cent, and other vegetables 8 per cent. It is notable that, notwithstanding the very rapid increase in population, the production per capita of the commodities indicated, with the exception of meats and dairy products, has remained approximately the same or has increased.

Similar statistics are not available for vegetables other than Irish and sweet potatoes, but it is reasonable to assume that there has been at least a proportionate increase in production. The figures for Irish potatoes may be taken as a fair index of the normal increase of vegetable products. The potato acreage increased from 2,938,778 in 1899 to 3,668,855 in 1909, or 24.8 per cent, while the value of the product increased during the same period from approximately $98,400,000 to approximately $166,400,000, or 69.2 per cent. The value of all other vegetables increased during the 10-year period from $120,000,000 to $216,000,000 and the acreage by over 600,000. The statistics regarding canned vegetables are significant. In 1899, 19,300,000 cases of canned vegetables, valued at approximately $28,700,000, were packed in the United States. In 1909, 32,800,000 cases, having a value of approximately $51,600,000 were packed.

The area from which vegetables are drawn constantly is increasing, and improved canning, marketing and transportation facilities have made it possible to supply our large markets with vegetables in greater variety throughout the year. It is a well-known fact the the consumption of fruits and vegetable has increased considerably in recent years and that they constitute a larger and more important part of the permanent diet of the people.

With all the agencies now available for improving agriculture there is ground for optimism as to the ability of the nation not only to supply itself with food, but increasingly to meet the needs of the world.

TWENTY-TWO SILOS

Built in Grays Harbor County.

Agent C. F. Monroe of Grays Harbor county is quoted as follows in regard to the introduction of silos:

"By means of published articles, interviews with reporters, meetings and private conferences with farmers, the advisability and desirability of the use of silos was put before the people. As the result of this campaign 22 silos have been built this year with an average capacity of 70 tons. From accurate figures kept by one of our most reliable dairymen last year, it was found that 40 pounds of silage would replace 20 pounds of hay, at the same time producing a better milk flow, due to the use of the silage. Figuring the cost of hay at $20 a ton, which was less than many paid for it last winter, and figuring the cost of silage at $4 per ton. I find that the 22 silos will save $14,630 by cheapening the ration. The increased production due to the use of the silage I would estimate at $1000, making a total of $15,630.

UNPROFITABLE COWS

Are Sold From Nineteen Herds.

In the cow testing work in Walla Walla county the past year by County Agent Patton 123 cows were discovered to be unprofitable and sold from 19 herds. Through the recently organized milk producers' organization in the Walla Walla valley, milk producers have secured an increase of 1 1-2 cents for their milk, amounting for all milk affected, to about $3000.

$1150 F. o. b. Racine
For Mitchell Junior—120-inch Wheelbase

Mitchell SIXES

$1460 F. o. b. Racine
For 7-Pass. Mitchell—127-inch Wheelbase

Now Also An $1150 Model

With Nearly All the Mitchell Extras
A Doubled Output to Meet a New Demand

Thousands of men have wanted a car with all the Mitchell extra features. But they did not want a car so big and impressive. They did not want a 7-passenger car.

We have built for them the Mitchell Junior—a Mitchell Six in little smaller size. Its 40 horsepower is ample for five passengers. Its 120-inch wheelbase gives plenty of room for five—more than most makers give.

The $1150 price gives all of the saving to the man who doesn't want extra power and size.

Last year we sent out thousands of these cars before announcing this new model. And Mitchell Junior has proved itself as perfect as the larger Mitchell. So we have more than doubled our factory capacity, to build as many Mitchell Juniors as we build of the 7-passenger Mitchells.

Hundreds of Extras

Both of the Mitchells embody hundreds of extras, paid for by factory savings. They give you at least 20 per cent extra value over other cars in their class. All because John W. Bate, the great efficiency expert, has cut our factory costs in two.

There are 31 extra features—things which other cars omit. On this year's output these extras alone will cost us about $4,000,000.

There is much added luxury. We have added 24 per cent to the cost of finish, upholstery and trimming. That is all paid for by savings made this year in our new body plant.

And there is now 100 per cent overstrength in every vital part. That is, every part is twice as strong as need be. The evidence is that this double strength makes the Mitchell a lifetime car.

Twice as Strong

The Mitchell standard for many years has been 50 per cent overstrength. Under that standard Mitchell cars have proved marvels of endurance.

Two Mitchells that we know of already have exceeded 200,000 miles each. Seven of them have averaged 175,000 miles each—over 30 years of ordinary service.

But in 1913 Mr. Bate spent a year in Europe. When he came back he started out to double our margins of safety—to more than match the highest European standards.

It has taken years to do this. But we announce this year this double strength in every vital part.

Over 440 parts are built of toughened steel. All parts which get a major strain are built of Chrome-Vanadium. We use steel alloys which cost us up to 15 cents per pound. And all the parts on which safety depends are made oversize.

One result shows in the Bate cantilever springs. We have used them for two years, on thousands of cars. And not one spring has broken.

That one fact will illustrate what this extra strength means in every vital part. For you know how springs break under shock.

Exclusive Values

These extra values are exclusive to Mitchell cars. No other factory in the world could include them at the Mitchell price.

This model plant, covering 45 acres, was built and equipped by John W. Bate. Every machine is adapted to build this one type economically. The methods employed here have cut our factory cost in two.

That is what pays for these extras. That is what pays for this vast overstrength.

Now a new body plant—building all Mitchell bodies—saves us a vast sum more. That goes into luxury—into heat-fixed finish, into rare-grade leather, into countless dainty details. The latest Mitchells are the handsomest cars under $2000.

Go see these extras, which are numbered by the hundreds. See what they mean in a car. You will not want a fine car which lacks them.

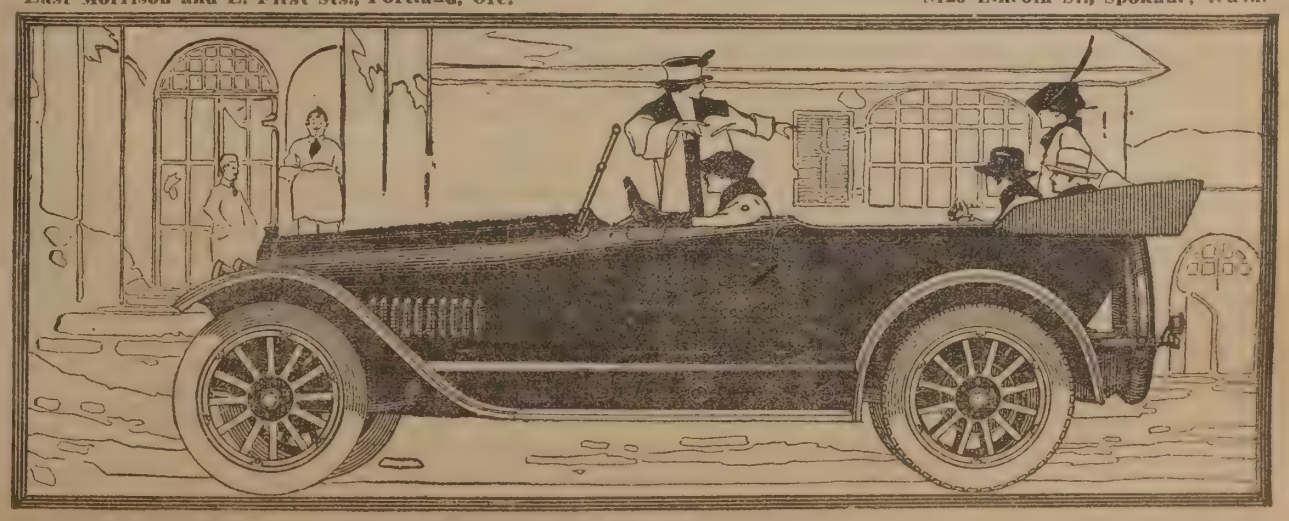
There are Mitchell dealers everywhere. If you don't know the nearest, ask us for his name.

MITCHELL MOTORS COMPANY, Inc.
Racine, Wis., U. S. A.

TWO SIZES

Mitchell —a roomy, 7-passenger Six, with 127-inch wheelbase. A high-speed, economical, 48-horsepower motor. Disappearing extra seats and 31 extra features included.

Price $1460, f. o. b. Racine



Mitchell Junior a 5-passenger Six on similar lines with 120-inch wheelbase. A 40-horsepower motor—¼-inch smaller bore than larger Mitchell.

Price $1150, f. o. b. Racine

Also all styles of enclosed and convertible bodies. Also demountable tops.

First Prize $300 Given Away in Great $300 First Prize

FARM INFORMATION CONTEST

Big New Free-for-All Competition

Readers of this paper—and in fact all residents of Washington, Oregon, Idaho and Montana—are invited to enter our Farm Information Contest, which is believed to be the most fascinating contest ever offered to the farm homes of the northwest.

This contest includes 60 questions which every person should be able to answer. If you don't know the answers you should know them, and now is the time to learn. There is a definite answer for every question. Many of them are simple, yet it is not everybody who can answer them right off the reel.

At one time in your life you may have been able to answer practically every one of them, but when these questions are laid before you—simple as they are—you will probably discover that some of your general information of earlier years has gone from you. For this reason our CONTESTANT'S HELPFUL OUTFIT containing correct answers to the more difficult questions and guides against error has been prepared, as is told in the detailed plan of the contest which follows.

This contest will give every one an opportunity to refresh his memory and at the same time provide interesting entertainment for the readers of the Farmer, besides affording the opening for

Earning Good Sums of Money

We will positively give EIGHT HUNDRED DOLLARS in cash awards (and more in event of ties) to the winners. As explained in the rules which follow, there will be five questions run in every issue of the Farmer for 12 weeks. The last five questions will appear in the issue of April 19.

You Can Enter Without Cost

You do not even have to be a subscriber of the Farmer to enter. As has already been stated, any resident of Washington, Oregon, Idaho or Montana is eligible to compete in this contest.

Five Questions Each Issue

The contest will be composed of 60 questions. Five will be run in each issue of the Farmer for 12 issues.

Answers to each question except No. 45 can be given correctly in from one to 10 words and will be given a score of 100 if correct. Answers to question No. 45 will be limited to 100 words each, and will be graded as to the common sense and general knowledge of farm conditions shown by the contestant without regard to spelling, grammar or penmanship. As with the other 59 questions, a perfect answer to No. 45 will be scored 100.

Perfect Score Is 6,000

The contestant who comes nearest to a score of 6000 and complies with all the conditions of the contest will receive the first prize; the next nearest, second prize, and so on. In case of a tie each tying contestant will receive the full amount of the prize.

There are 35 prizes as follows:

$150 is amount of First Prize.
$100 is amount of Second Prize.
$50 is amount of Third Prize.
$20 is amount of Fourth Prize.
$10 is amount of Fifth Prize.
$5 each, Sixth to Tenth Prizes.
$4 each, Eleventh to Fifteenth Prizes.
$1 each, Sixteenth to Thirty-fifth Prizes.

Read the Rules—Answer These Questions

1. In getting up from the ground, what part of its body does a cow raise first? A horse?
2. How many upper front teeth has a cow?
3. What letter added to a common ailment of chickens will spell something generally used in smoking?
4. What piece of harness has the same name as a small boat used in pulling a larger vessel?
5. What weed very common in the northwest is named after a great railroad builder?

Five more questions will appear next week.

A Valuable Aid to Contestants

One complete CONTESTANT'S HELPFUL OUTFIT, including all of the 60 questions and instructions and helpful warnings as to answers which would be wrong, and the correct answers to some of the most difficult questions, will be sent to any public library free of charge, upon request.

To each contestant who sends in a new, renewal or an extension of his subscription at the time of registering for the contest, this complete CONTESTANT'S HELPFUL OUTFIT will be sent in combination.

We feel that those beginning on the contest will find these suggestions as to what to avoid distinctly useful. This equipment supplies in convenient form everything needed to enable you to apply your ability to the best advantage, and will contain information enabling you to answer the most difficult questions correctly.

Puts Questions in Reach of Children

This CONTESTANT'S HELPFUL OUTFIT puts the solution of the questions in the reach even of the children, it being the purpose to make it possible for everybody in Washington, Oregon, Idaho and Montana to compete. This outfit includes, besides general information about the plan of the contest, the following:

Guide against wrong answers, which includes either correct answers of more difficult questions or easy references as to where to find the correct answers; and blank forms on which to write your answers in such a way that there can be no confusion when your answers are taken up by the judge for scoring.

It will be worth considerable to you to be assured that your answers are reaching the Farm Information Editor in such form that he will know in every instance exactly what question you intended to answer. This CONTESTANT'S HELPFUL OUTFIT will make it possible for you to

Begin Work at Once

On account of the large number certain to send for our CONTESTANT'S HELPFUL OUTFIT, thus making it possible for them to answer the entire 60 questions without delay, it is deemed advisable to offer some special inducements to secure prompt returns from this particular class of contestants. By securing the early replies of those who are thus supplied with the entire 60 questions, we will be able to have their papers carefully scored before the final rush of answers toward the end of the contest.

Understand, it is not absolutely required that those who use our CONTESTANT'S HELPFUL OUTFIT send in their replies at once, but, in order to induce them to get in early, the following plan for enlarging the awards to those prize winners whose answers come in early is offered:

ENLARGED PRIZE LIST—$800 CAN BE WON—ENLARGED PRIZE LIST

For those who use our CONTESTANT'S HELPFUL OUTFIT.

Thirty-Five Prizes	Amt. of prize if winner sends in answers during 1st period, Feb. 1- Feb. 21	Amt. of prize if answers sends in winner during 2d period, Feb. 21 Mch. 14	Amt. of prize if winner sends in answers during 3d period, Mch. 14 April 5	Amt. of prize if winner sends in answers during 4th period, April 5 April 19	Amt. of Prize for winner who does not send in answers before April 19
First Prize	$300.00	$225.00	$200.00	$175.00	$150.00
Second Prize	200.00	175.00	125.00	110.00	100.00
Third Prize	100.00	87.50	62.50	55.00	50.00
Fourth Prize	40.00	35.00	30.00	22.00	20.00
Fifth Prize	20.00	17.50	15.00	11.00	10.00
6th to 10th 5 prizes each	10.00	8.75	7.50	5.50	5.00
11th to 15th 5 prizes each	4.00	3.75	3.00	2.20	2.00
16th to 35th 20 prizes each	3.00	2.50	2.00	1.50	1.00

To secure our CONTESTANT'S HELPFUL OUTFIT, fill out order coupon on this page and send it in to Farm Information Editor, with your personal check, money order or 2-cent stamps, for $1 for one year or $1.50 for three years.

Other Rules

The answers will be passed upon and graded by a fair-minded, thoroughly competent judge.

Two weeks will be allowed for sending in answers after April 19, 1917, date of the issue containing the last five questions.

Remember, your failure to answer all the questions will not necessarily exclude you from the contest. There are 60 questions to be answered and it is not reasonable to suppose that all our prize winners will attain a perfect score. Your answers must all be sent in at the same time. Do not send any answers until you have completed the full list or as many as you can answer.

Those who use our CONTESTANT'S HELPFUL OUTFIT will be able to send in their complete set of answers without delay, there being no need of their waiting for the questions as they appear in The Farmer from week to week down to the final issue of April 19. In order to get as prompt returns as possible from those contestants who use our CONTESTANT'S HELPFUL OUTFIT, extra inducement is made in the prize awards. SEE ENLARGED PRIZE LIST.

Announcement of prize winners will be made and prize checks mailed as soon after close of contest as possible.

If any point is not clear, do not hesitate to write the Farm Information Editor.

All answers must be mailed on or before midnight, May 3, 1917, as shown by post-office dating stamp on your envelope.

If your subscription is paid ahead, the time paid for herewith will begin at the date to which you are now paid.

Hides Are Valuable

Valuable By-Product Is Often Neglected

By R. T. BEEBE, Seattle, Wash.

The writer of this article, Mr. Beebe, is manager of the H. F. Norton company, hide dealers, of Seattle, Wash., and his suggestions will be read with much interest by those who are becoming aware that profit in farming, like other branches of industry, depends to a very large extent on the by-products of the farm which can be cashed.

Probably no other article on a farm is given as little consideration for the actual value involved as the hides and skins of cattle, horses and calves killed or which have died from natural or other causes. A great many people believe that hides are valuable only when taken from animals slaughtered for beef. While a hide taken off in this manner usually is more attractive to a tanner, hides from dead animals if removed within a reasonable time command full value. Horse hides also bring a good price, although not as much as a cow hide as the leather can not be used for sole leather purposes.

When an animal dies it should be skinned as soon as possible, especially in warm weather.

Care in Skinning.

Care should be taken in skinning not to cut or score the hide any more than necessary, as each cut or score makes a damaged piece of leather and, as it costs no more to tan a good hide than a cut one, tanners naturally are more anxious to buy hides well taken off.

In skinning, a knife with a slightly curved blade should be used, the most practical one being about a seven-inch blade. The throat should be cut lengthwise, not crosswise, and in this way the entire head may be skinned out. Every bit of hide should be skinned off, skinning the legs down to the hoof. The ears and dew claws should be removed as they can not be made into leather. As calf skins are used only for upper leather and other fine grades the heads are not used and the head on these should be skinned out only to the ears.

Calf Skins.

Calf skins command at all time the highest price per pound and are classed as a calf skin only when the skin weighs 15 pounds or under in its green state. Heavy veals where the skin weighs over 15 pounds and under 25 pounds are classed as kip and command a slightly higher price than hides, being used mostly for heavy boot uppers. A hide weighing over 25 pounds, even though it may be taken from what in many cases would be called a veal is classed as a hide, as all hides over this weight are tanned into other than upper leather grades, such as light harness, strap, saddle, belting and sole leather stock.

After the hide has been removed it should be thoroughly salted on the flesh side, with coarse salt, if it is to be held for any length of time. Hides, it should be remembered, will spoil as easily as fresh meat and in warm weather especially should be given prompt attention. Salt to about one-third to one-half the weight of the hide should be used, leaving the hide lay flat on the floor until such time as it is disposed of. The salt should be cleaned off thoroughly before shipping and saved to be used again. If more than one hide is to be salted place them one on top of the other.

If the hide is to be shipped at once, and this as a rule is done, a small amount of salt should be put on the flesh side and the hide rolled up into a bundle and tied tightly with wire, or placed in a gunny sack. Hides can be rolled into a compact bundle by throwing the head in about a third of the length of the hide, turning in the two sides, one on top of the other, making the bundle about a foot wide and rolling tightly from the head end. Always bundle hides hair side out.

Where no salt is available, it is fairly safe to ship hides green, where they will not be in transit over one or two days and with the rapid transportation of today your returns should be received within the course of two or three days.

Hides are subject to damage by rats, dogs, etc., and should not be left lying around; direct shipment to some reliable hide dealer usually being more satisfactory than waiting for the junk man. Shipments of hides can be made by express, auto freight, freight or by parcel post. Of course, where shipment is made by parcel post hides must be thoroughly wrapped and free from any leakages.

There is a considerable natural shrinkage in green hides which should be taken into consideration in estimating the value of your shipment, the ordinary hide shrinkage in transit about two or three pounds. Hides should be salted for about two weeks to be classed as cured hides and will not, of course, shrink so much in transit, and while they command a higher price per pound than green hides they will shrink from 15 to 20 per cent in curing.

The hide markets today are, on account of the Europeon war, considerable above normal, green hides being quoted at from 15 to 16 cents per pound and cured hides 19 to 20 cents per pound, the normal price being around 10 to 12 cents. Bull hides, which always have a lower value than a cow or steer hide, on account of the thick, spongy neck and uneven thickness of the hide, are today bringing 12 to 13 cents green and 15 to 16 cents per pounds cured. Kip skins are valued at 18 to 20 cents per pound and calf skins usually quoted at 18 to 20 cents are realizing about 30 cents per pound. Horse hides on which the mane and tail should be left to bring top value are worth from three to five dollars per hide, being bought by the piece.

Even horse hair, which should be saved when trimming your horses' manes and tails has a value of from 15 to 25 cents per pound; the tail hair being the more valuable.

If you have not been saving your hides and skins, save the next ones, send them to some reliable dealer and benefit by the profits and tell your neighbor if it proves satisfactory. Your experience may be of value to him also.

Contagious Abortion.

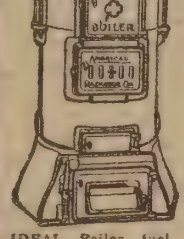
In Snohomish county, Washington, Agent C. C. Farr has had some trouble with contagious abortion in the dairy herds. Many meetings were arranged throughout the county and outside help called, over 540 dairy farmers being reached and advised as to preventive measures in this way.

Hand Shaking Custom Old.

The custom of hand shaking dates back to Henry II. of England.

Radiator heating makes farm life ideal

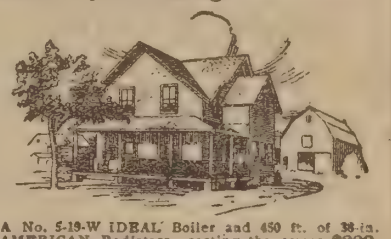
The people who heat their homes with IDEAL Boilers and AMERICAN Radiators prove to themselves and to their friends, that winter in the country can be made most comfortable, enjoyable and profitable.



AMERICAN RADIATORS & IDEAL BOILERS

You can have complete comfort in *your* own home, whether it is an *old* or *new* building.

A basement or cellar is not necessary, as the IDEAL Boiler can be put in side room or lean-to.



It is not necessary to have running water—the IDEAL Boiler uses the same water over and over for years, and the small loss from evaporation is easily refilled with a bucket.

It is not necessary to have special kinds of fuel—IDEAL Boilers will burn almost anything, wood, lignite, screening, slack, soft coal, etc., and best of all—*It is not necessary* to have a mint of money before you can purchase an IDEAL Boiler and AMERICAN Radiators for your building!

IDEAL Boiler fuel pots mix the air and coal gases as in a modern gas mantle, extracting ALL the heat from the fuel.

Easily put in even in mid-winter without tearing up or disturbing present heating arrangements until ready to put fire in the IDEAL Boiler.

A No. 5-19-W IDEAL Boiler and 450 ft. of 38-in. AMERICAN Radiators, costing the owner $200, were used to heat this farm house. At this price the goods can be bought of any reputable, competent Fitter. This did not include cost of labor, pipe, valves, freight, etc., which vary according to climatic and other conditions.

Send for book "Ideal Heating" (free)

We want you to know why an IDEAL heating outfit will give you most heat at least cost, and why it is the best for years of daily service without repairs or attention. Write today for our free book. You ought to read it.

Shipping Cream

From San Francisco to Honolulu

By HORACE ADDIS.

Sweet cream is shipped from San Francisco to Honolulu. It is first pasteurized and then sealed in sterilized tin containers, after being cooled close to the freezing point. It is placed in storage on the ship, where the temperature is kept at about 33 or 34 degrees.

Mr. Dorman, who since 1913 has been in charge of the western office of the dairy division, U. S. department of agriculture, with headquarters at Salt Lake, asserts that, owing to the pure atmosphere, or something in the climate, or perhaps the skill of the dairymen, it is possible to produce milk in the western cities of a lower bacterial count and buttermilk than that produced in the eastern and middle states. This was shown when Portland won first and Los Angeles second on market milk at the national dairy show, in Springfield, Mass., with the western milk seven days old, while that from the east could be shown in 24 hours of the time it was milked. Tillamook cheese was also first and cheese from Idaho second.

It will thus be seen that the situation presents ever widening opportunities, with climate favoring, and, with dairymen doing their part, it would seem there is no reason why Portland and Seattle should not develop an export trade in milk and cream and that the states of the northwest should manufacture a superior quality of butter and cheese that would successfully compete anywhere in the markets of the world.

Good Records

Walla Walla Valley Association

By O. V. PATTON.

The figures of the Walla Walla Valley Cow Testing association for the month of December, 1916, show that the average production per cow is greater than for the same month in 1915 by 97 pounds of milk and 3.8 pounds of butterfat. Comparing the same two periods again, there are eight herds, comprising 118 cows, which average better than 30 pounds of butterfat per cow for last month, while a year ago there were only four herds, comprising 64 cows. There are also 51 cows on the honor list this month owned by 17 members as compared with 36 cows owned by 11 members for December a year ago.

On the 40-pound list this month there are 19 cows that produced better than 50 pounds of butterfat for the month, and 32 which produced between 40 and 50 pounds.

The same two cows that headed the list a year ago are again at the head of the list, both producing better than 80 pounds for the month. They are both registered Holsteins belonging to the Walla Walla college.

A list of cows producing better than 50 pounds of butterfat during the month of December, 1916, as shown by the figures submitted by the tester, Clarence Bixby, follows:

Owner.	Breeds	Lbs. of milk	Lbs of but. fat.
Walla Walla College	H	2421	87.2
Walla Walla college	H	2468	83.9
State Pen	H	1116	66.8

Questions

Are Answered by A. B. Nystrom

I would like to know about feeding moldy silage to milk cows. My silage is moldy about two feet all around the edge. I feed 30 to 40 pounds per day to 10 head and am down about six feet in the silo. The mold seems to be going away a little bit. I have had several fellows look at it and they said if the cows eat it to feed it to them, so I thought I would write to you and see what you thought about it.

B. R., Rochester.

In a recent issue of the Farmer I answered some inquiries regarding moldy silage. I do not believe it pays to feed moldy silage to cows. While it may not be injurious at all times, the fact still remains that moldy silage is injurious more or less to all animals and it is not well to take chances. If the silage shows moldy around the edge it shows that it has not been well trampled or that enough water had not been added when the silo was filled. Perhaps also the sides of the silo admit air. You should see that the silo is absolutely air tight and that plenty of water is added when filling and the silage is well tramped as it goes in.

Ration With Oat Hay.

I have nothing but oat hay to feed my cows. What kind of grain or grains or other feed should I give to make a balanced ration? Will it pay me to run my hay through a cutter? What kind of grain is best for calves with skim milk? J. A. M., Buckley.

If your oat hay is not especially palatable I believe that it would pay to run it through a cutter. I think that you will find that the cows would eat it up cleaner, although as a general rule we do not advise running palatable hay through any cutter. You need a succulent feed of some kind and I would advise you to get some roots if you can; or if these are not available, get some dried beet pulp and soak it over night in about three to four times its weight of water. Feed all of the oat hay the cows will eat up clean and from five to seven pounds of the dried beet pulp which has been soaked over night, and then in addition mix the following grain ration: Three parts by weight of bran, two of ground oats, and one of oil meal. Feed this to the cows in the proportion of one pound to every three and a half pounds of milk.

We have gotten good results by feeding ground oats to calves, and a mixture of ground oats and bran is not a bad combination. If you can grind corn I would prefer a mixture of equal parts of ground oats, ground corn and bran for calves in supplementing skim milk. As for the rest of the ration, give the calf some well cured hay, such as timothy and clover, or timothy alone, as soon as he will eat it, which will be when he is from three to four weeks old. Alfalfa in small quantities may be fed, but with this roughage there is danger of the calf's eating more than he can properly digest.

Feeding Soy Bean Hay.

Can you tell me anything about the soy bean for hay, mixed with oats, and with oats and vetch, for silage?

J. F. W., Sequim.

I have never used soy beans except as a meal, but if you can get a large enough yield I see no reason why it would not be just as good as peas or vetch because it is of the same nature. It could be mixed with oats, and oats and vetch, for silage, I believe, just the same as peas and vetch.

Frozen Sugar Beets and Mangels.

I have some frozen sugar beets and mangels and when thawed out they turn black and very watery. Please advise me if it is dangerous to feed them to cows. They eat them readily. I fed the tops while green, which was very good feed. Is there any way to preserve the tops without a silo?

E. C. L., Prosser.

I have not had a great deal of experience in feeding frozen root crops, but my impression would be that there would be no injurious effects from feeding these so log as they are fresh, or have just thawed out; but after they have been exposed to a warm temperature for some time they decompose rapidly and the decomposed roots are likely to cause indigestion. Aside from this the frozen roots will in a short time produce a very undesirable odor about your barn, and this may have a tendency to taint the milk to some extent.

Green beet tops and mangel tops make a good feed, and I have heard of its being used in the silo to good advantage, but I know of no other way to keep the tops in good condition so they may be used during the winter time. If you have no silo, perhaps you can dig a hole in the ground and then cover this with earth in such a way that the water from the rains will not drain into the hole. I have seen good silage made out of slough grass in this way and I have no doubt that the beet tops could be preserved in a similar manner. In reality this is a small silo, and the fermentation would be exactly the same as would take place in a silo.

TO EXTEND MARKET

Creameries of Coos and Curry.

The Coos and Curry County Creamery association in western Oregon has perfected plans for placing the products of the creameries which belong to the organization in the markets of the Coast. Fourteen creameries in the two counties have joined the association. Claude H. Giles, an attorney of Myrtle Point, has been employed as salesman and will travel from Spokane to Los Angeles through the Coast country. He will handle the marketing of the entire output of all of the creameries. Guy Ford has been employed as inspector and will each week inspect every factory included in the membership. J. E. Carl is president of the new association.

Raise Your Calves on
Blatchford's Calf Meal
and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves. It is steam-cooked and no trouble to prepare or use.

Dairy Farm Cropping System

Helps to Control Weeds, Insects and Plant Diseases

The cropping system on the dairy farm, be it large or small, should be so planned as to accomplish certain definite purposes. First, it should provide for a sufficient amount of the proper kind of feed; second, it should contribute toward the maintenance of crop yields, and third, it should be so arranged as to minimize labor and waste land, says E. B. Stookey of the Western Washington experiment station.

The contribution that a well planned crop rotation system makes toward maintaining or increasing crop yields is a big argument in its favor. When the other important factors which influence plant growth, viz., drainage, tillage, moisture, humus and plant food, are properly balanced, a good crop rotation system will aid in maintaining the physical condition and fertility of the soil and will help in controlling weeds, insects and plant diseases. The rotation should include both deep and shallow-rooted crops, humus-producing as well as humus-destroying crops, nitrogen-gathering as well as nitrogen-consuming crops, cultivated and non-cultivated crops, and they should be so varied in character as to hold insects and plant diseases in check. The use of crops on which insects and plant diseases do not thrive is a good way of controlling such pests. No single cropping or haphazard system can meet all of these requirements, but a definite system planned with these points in mind is necessary. The use of grass, cultivated and grain crops in rotation will be found to meet all of these requirements, and the number of different combinations of these crops is sufficiently great to be applicable to most conditions. Experiments and experience dating back hundreds of years show that rotations planned along these lines help greatly in maintaining crop yields.

PLAN OF CROP ROTATION

The main crop rotation may be changed to meet different soil conditions and the need for different crops. The following rotations make use of other crops

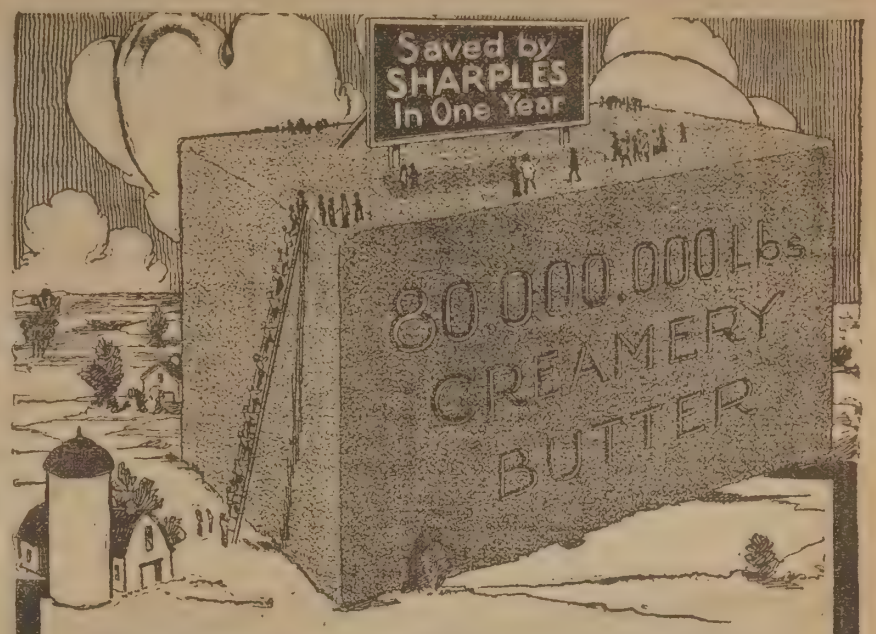
1. Clover and grass.
2. Clover and grass.
3. Potatoes.
4. Oats and peas or vetch.

1. Clover and grass.
2. Clover and grass.
3. Corn and potatoes.
4. Wheat and vetch, and oats and peas or vetch.

1. Clover and grass.
2. Clover and grass.
3. Corn.
4. Oats, peas, oats and peas or vetch.
5. Wheat.

1. Corn and potatoes.
2. Oats and peas or vetch.
3. Wheat—fall-seeded rye for green manure.

Patience First



In Teaching the Calf to Drink

Take the calf away from its dam as soon as it has nursed, or it may be taken away and not allowed to nurse at all, says Professor James N. Price, in a Washington State college bulletin. It is better to let the calf nurse its first feed in order that it may get it warm. Anyone who has had experience in feeding a newly born calf its first feed from the pail knows that the milk gets cold before the operation is completed. The calf that is taken away from its mother the first day is much more easily taught to drink than the one that nurses for a week or more. It is important that the calf get the first (colostrum) from its mother. This milk is especially fitted to the needs of the calf at that time and has a laxative and stimulating effect on the digestive system.

One of the important characteristics in the makeup of a successful calf feeder is patience. In teaching a calf to drink far more may be accomplished by patience than by force. If the feeder will back the calf into a corner of the stall, get astride its neck, hold the pail firmly, let the calf have hold of two or three fingers of one hand, gently coax nose into the milk, then slowly slip the fingers out of its mouth, holding them on the nose; and each time the calf jerks his head out of the pail and sticks his head into the air, looking for something to suck, let him have the fingers and repeat the operation, the calf will learn to drink by the second or third day. But when the feeder sets the pail down, takes the calf by both ears, forces his nose to the bottom of the pail and holds it there until the calf "bellers" for air, all that is accomplished is that the feeder gets mad, likewise the calf, and together they spill the milk.

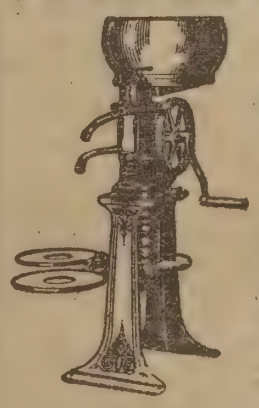
Bird Food.

According to American Forestry, the hairy woodpecker likes fat pork, while tree sparrows are very fond of dog biscuits. Mocking birds relish bread and milk.

The height of this print of 80,000,000 lbs. of butter is 90 feet —its length 180 feet. An average loss of 10 lbs. of butter per cow by all separators *except Sharples* causes this appalling yearly cream loss in the United States alone. If all separators were Sharples this immense pile would be *saved* annually. For this reason: Sharples is the *only* separator that skims clean regardless of speed. Look back over your past experience with separators. Many a day you determined to turn at top speed and not lose cream. But unconsciously, little by little, you slackened and *lost cream.* That separator was not a

SHARPLES
SUCTION-FEED
CREAM SEPARATOR

If it were you could have slowed down and still gotten every particle of cream. Sharples is the only separator that "meets the moods"—almost human in its adaptability to every day conditions. It's the separator that not only *can* do unequalled work, but *will* do it, regardless of unfavorable circumstances. Sharples is



—the *only* separator that skims clean at widely varying speeds.
—the *only* separator that delivers cream of unchanging thickness—all speeds.
—the *only* separator you can turn faster and finish skimming quicker.
—the *only* separator with just one piece in the bowl—no discs, easiest to clean.
—the *only* separator with knee-low supply tank and a once-a-month oiling system.

Over a million users! Made and strongly guaranteed by the oldest and greatest separator factory in America. Many a Sharples has been in constant use for 25 years at trifling repair cost. Send for free Catalog to Dept. 49

Anker-Holth to the Front

On top of all the other new and very important features that place the Anker-Holth far in the lead, comes one that will save the thousands of users of Anker-Holth Cream Separators hundreds of dollars.

Very few people turn their separator at the correct speed every time they use it, and very often it is too low, which will cause a loss in butter-fat.

ANKER-HOLTH MACHINES TO BE EQUIPPED WITH AUDIBLE SPEED INDICATOR, made especially to fit our machines. No more holding the watch, no more lagging in speed, no more losing dollars on account of slow speed; this will make every user of an Anker-Holth Cream Separator feel that he is getting it all.

This in connection with the other big features will place the Anker-Holth that much farther in advance of any others.

It costs less money, it gets more butter-fat, it saves expense, it saves worry. WHY NOT HAVE THE BEST?
We aim to give you value received and square treatment. Try us and see,

Practical Portable Hog House

"The old-fashioned idea that the hog is a tough, filthy animal still persists, and many farmers believe and act in the belief that anything is good enough for a hog," says Professor K. J. T. Ekblaw of the University of Illinois agricultural staff. "As an actual thing, there is no farm animal that needs care and protection more than the hog. The horse and cow are protected by a heavy coat of hair in the winter time; even the calf or colt will grow a good fur coat when exposed in winter. Chickens have a thick layer of fluffy insulating feathers which keep even their small bodies warm, but the hog has nothing except a sparse coat of stiff hair between his skin and the cold. Little pigs farrowed in cold temperature with no shelter generally die, and even if they live never thrive at all well.

"The 68 million swine in the United States on April 1, 1916, had a farm value of $571,890,000. In number, swine exced any farm animals; in value they are second only to cattle.

"The 'A' shape, shown in the accompanying illustration, is a type of swine house that is perhaps more widely used than any other, since its construction is very simple. The framing consists of 2x4's mounted upon a 1-inch floor nailed to 4x4 runners. An end doorway is provided, through which the swine may gain access to the interior of the house. On one of the sloping sides are set two doors which open to the side. These may be hinged at the top if desired. One disadvantage of the 'A' house is that there is but little choice in the selection of locations for the entrance door. It must necessarily be placed in the lower middle of the end. It is sometimes desirable to make the side doors double, that is, cut in two horizontally in the middle so that the lower portion can be closed."

The above is taken from a series of technical bulletins of the National Lumber Manufacturers' association, on the construction of farm buildings.

Type of hog house most widely used.

Veterinary

Dr. S. B. Nelson

Please tell me how to distinguish colic from clogged or straw pack in horses, and a remedy. The horse was first doctored for kidney trouble, and then it was thought he was packed. He lingered along two weeks and then died. The other one acted as though it was his kidneys, and was given nitre and soap-water injections several times, but it did no good. In the morning he was puffing as though he had been running, and died in a short time. He was on pasture, bunch grass; was sick 18 hours. When opened I found the intestines bursted and puffed as though full. H. C. W.
Ephrata, Wash.

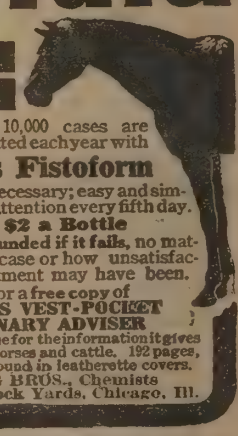
Colic is just a name for the symptom of pain which animals like horses manifest when they have indigestion or spasms or some obstruction of the bowels. The pains or abdominal troubles are divided into many forms of colic—spasmodic copil, flatulent colic, where the intestines are filled with gas, and obstruction or obstructive colic. This obstructive colic may be due either to a twist of the intestines, to a slipping of the intestine into itself so that instead of having one wall it has three, or to food material clogging it. The indigestibility of straw will cause colicky symptoms at first. The animal will not yield to the usual treatment for colic, and after two or three days the disease lingers on and sometimes the animal will live for even a week or ten days. Horses very seldom have kidney trouble. In my experience as a practicing veterinarian covering nearly 30 years I have not seen a score of true inflammations of the kidneys. On account of the colicky symptoms causing spasms of the neck of the bladder, and when the spasm is over and the pain relaxes and the muscle at the neck of the bladder relaxes also and the animal is able to void his urine many people believe that it has been a kidney or bladder trouble. It is the other way—that the pain, that is, the abdominal pain, has caused the spasm of the neck of the bladder, which is relieved when the pain is gone.

I do not believe that your two horses suffered from quite the same disease. The first one seems to have been a true infection, while the second one was probably due to bursting of the intestines. The peculiar puffing that you speak of is a very strong positive symptom of such a condition in the intestines.

I am going to give you a simple treatment for this. It does not cure all cases, but it is one of the best that you can use at home. Give your horse, first when you notice that it is sick, a quart of raw linseed oil with one to one and a half ounces of turpentine in it. Follow this in the evening or the following morning with a pound of Epsom salts in two to three quarts of water, then alternate oil without the turpentine and salts night and morning for three or four days. Give the animal all the water that it wants to drink, in small quantities, often, until the thirst is gone, later offer water as usual. Do not give it anything to eat at all during the time it is sick or until the bowels have been pretty well emptied. Rectal injections of simple warm water in a large quantity, two, three or four gallons, as much as the posterior intestines will hold, will be of value. After the bowels are opened, which will take from four to seven days, then begin with very light feeding, giving just a handful to begin with.

We have a 10-months-old sow in good flesh that was slightly lame in one hind leg after being unloaded from a three-mile journey. Now both hind legs are very stiff and a trifle swollen. Her ration is mainly rolled oats and sweet clover. G. W. B.
Valley, Wash.

Try giving your sow from one to two ounces of castor oil in her feed. Then give her on her feed morning and evening 15 grains of potassium iodide for several days. Give her a comfortable place out of the draft to sleep. Do not let her sleep on a board floor where there are cracks in the floor. I think it would also be advisable if you would add a carbo-hydrate to her feed, such as corn or a little oil meal. I think her feed is pretty concentrated.



WONDERFUL RECORD
In Butter Production Announced.

That the Holstein cow, Segis Sayne Johanna, owned by Oliver Cabana Jr. of Elma Center, N. Y., recently made a record of 50.68 pounds of butter in seven days, thereby breaking the highest known world record for a week's production, is word received by interested dairymen in the northwest. She produced 722 pounds of milk, containing 40.53 pounds of butter fat in the seven days. She was bred by James Cortelyou of Somerville, N. J.

Homesteads

Under New 640-Acre Tract Bill

"When the president signed the 640-acre grazing homestead bill there was placed upon the statute books a law which, it is believed, will accomplish a great deal toward making homes for those who desire to engage in a small way in the live stock industry, and also meet the constanly decreasing supply of sheep and cattle in the public land states," remarked Congressman Addison T. Smith in commenting on the provisions of the new law.

"This legislation," continued Mr. Smith, "has had strong advocates and opponents before the committee on public lands in both branches of congress during the last few years, and the bill has been materially changed from the form in which it was originally introduced. The opposition came from the large sheep and cattle men, but the bill as finally amended is now fairly satisfactory to them.

"The law authorizes the entry of 640 acres of semi-arid land more suitable for grazing than cultivation after the secretary of the interior has designated such areas. While the land may be selected prior to such designation and the application filed in the local office, no right to occupy such land shall be acquired by reason of said application until the lands have been designated by the secretary of the interior as stock grazing lands.

Three Years' Residence.

"In order to acquire title residence of three years is required with the usual leave of absence of five months in each year, and permanent improvements must be made to a value of not less than $1.25 per acre, one-half of which must be expended within three years after date of entry. No cultivation is required and commutation is not allowed.

"A personal examination of the land is required under this law before application can be made, as under the general homestead laws, and the regular fees and commissions must be paid. Additional entries are allowed in sufficient quantity within a radius of 20 miles from such former entry of grazing land not to exceed in the aggregate 640 acres, without residence on the additional entry, but improvements must be made equal to $1.25 for each acre.

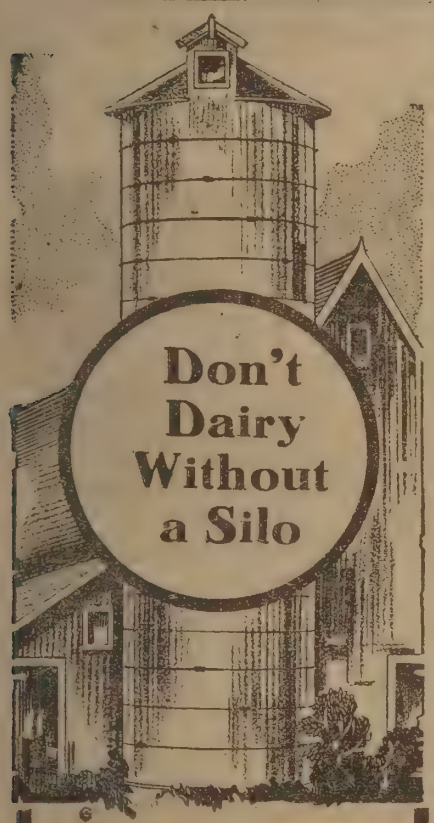
"The government reserves the title to coal and other minerals in the lands entered under this act. It also provides that water holes shall be reserved and open to the public, and that the secretary of the interior shall withdraw from entry a sufficient quantity of land for driveways to watering places, shipping points and the summer and winter ranges."

COW TESTING

New Associations in Jefferson.

Working in Clallam and Jefferson counties, County Agent O. T. McWhorter reports two new cow testing associations for the year including over 900 cows, there being 5330 cows in the two counties, and for each cow, Mr. McWhorter estimates, that an average of $10 worth of hay is purchased each year. To save this $53,330 to the county is an object Agent McWhorter now has in view. He has demonstrated that it is possible to grow oats and vetch, or wheat and vetch profitably for both hay and silage, and that it is really unnecessary for dairymen of the county to ship in hay from the outside. In the same connection he has taken up the introduction of red and sweet Clover. Another project of the county agent is the organization of a 600-acre drainage district, on which the production has been increased by irrigation over 30 per cent.

University Steers Sell High.



At the Pacific International Live Stock show at Portland the state university of Idaho has for five times in succession had the grand champion steer over all breeds and ages. The grand champion of this year, the university bred pure-bred Hereford Bonnie Lad, sold at auction for $747. The five Idaho Portland grand champions have belonged to the various breeds as follows:

1912, pure-bred Hereford.
1913, pure-bred Shorthorn.
1914, pure-bred Aberdeen Angus.
1915, pure-bred Shorthorn.
1916, pure-bred Hereford.

The five steers sold at public a ction have brought an average price of 55 4-5 cents per pound.

Clark Solves the Problem.

"If the high cost of living bothers you, do not wait for governmental remedies. Buy some laying hens, eat more corn products and rice," says Speaker Champ Clark of the house of representatives. "The food embargo bill may or may not pass," he declared. "I think the government can help lower food prices by legislation, but consumers can cut down expenses in other ways." He declared he would urge the enactment of a federal law prohibiting the killing of veal calves. He said speculators violate the law by holding eggs for a raise.

"I Would as Soon Dairy Without Cows as Without a Silo!"

said one of our dairymen friends, a pleased user of the **Weyerhaeuser Silo.** And he means every word he says.

He is one of those dairyman who saw the writing on the wall, and now he laughs at the high price of feed. He is making money.

Hogan System

M. Hakenstad Commends Method

The address of Mr. Hakenstad, as cited herewith, commends Mr. Hogan's system. There are a great many poultrymen who swear by this system, but is it not possible that judgment has been formed too hastily. The system is under investigation; it is on trial. Experiment stations are not infallible; they make mistakes, but none of them, so far as I know, have published or given out any data favorable to the system, nor have they published anything unfavorable, so far as I know. It is possible others have investigated it privately and thoroughly. It is possible that private breeders have gone into it more thoroughly than the stations have done. But evidence is not very conclusive. Mr. Hogan deserves credit for stimulating investigation along that line, even though his particular system may fail.—J. D.

Addressing an audience of practical poultrymen and farmers, Martin Hakenstad recently told the members of the Snohomish County Fruit Growers' association that there were just two important points in connection with handling the egg side of the poultry business at a profit. The first point is get the egg; and the second is like unto it—get the price.

Taking up the first essential, Mr. Hakenstad pointed out that it is as necessary to cull out the "boarders" in the poultry business as in dairying, although the weeding out process has perhaps received more attention in connection with cows than with hens. One of the difficulties in picking out the boarder hen has always been that we could not catch her "at the milk pail," and that without the use of the troublesome trap nest it was impossible to separate the producers from the loafers. Mr. Hakenstad, however, is of the opinion that the Hogan system in a large measure overcomes this old difficulty by making the detection of loafer hens largely a matter of scientific observation of the structure of the hen herself.

The Hogan system divides the chicken tribe into three classes: first come the egg type, which have the egg laying tendency so strongly impressed upon them that they will lay if it is at all possible. Next come the dual purpose chickens, corresponding somewhat to the dual purpose cow. The third class contains those hens which will produce meat, but few eggs.

"And these meat producers," Mr. Hakenstad explains, "will not lay eggs in profitable numbers no matter how they are fed. The only cure for their nonproductivity is the axe."

The principal point upon which the determination of type rests is the matter of the thickness of the pelvic bones. The thinner these bones the truer the individual runs to the egg type. At one extreme, for instance, may be a hen with pelvic bones one-sixteenth of an inch thick. At the other end is a big, "beefy" hen with inch thick pelvic bones. The one is a natural layer, and the other is not and never will be—her "machinery" is constructed for an entirely different purpose.

A second important point in connection with the physical structure of a chicken is its prepotency, or its ability to pass along its characteristics. Prepotency is largely a matter of vitality plus. The supremely vigorous hen probably will pass on to her descendants those characteristics, good or bad, which are conspicuously hers. And for this reason the chief index to prepotency is the formation of the head. The eyes should be invisible when looking at the hen from straight in front, and this is true because the vigorous hen's head will be too wide and round to show her eyes from this position. Those narrow-faced, "crow bill" chickens which come of degenerate stock or which received a severe set back in growth and vitality early in life, can be detected by this test.

Turning to the marketing end of his subject, Mr. Hakenstad stated that there are three ways of selling eggs: first, the egg farmer can sell them at the store, letting the store keeper make the price on the eggs and on the merchandise which he gives in exchange; second, eggs can be sold direct to the consumer; and third, they can be sold through the commission broker. The speaker admitted that he had at one time depended on the first of these methods, and had found it unsatisfactory. The third method he knew little about. The direct to the consumer method he finds wholly satisfactory, as it enables him to get the full retail price for his commodity and insures his customers a strictly fresh egg.

In conclusion Mr. Hakenstad called the association's attention to a government bulletin on selling through the local creamery. This plan has been worked out very thoroughly, and has proved satisfactory in at least one instance.

This bird is a high school student, residing on the Boise high school farm. He won second place in the White Rock cockerel class at the recent Idaho State Poultry show at Boise.

Hen Can Not Walk.

"I have a hen down in her legs and back. She eats all right but can not walk." W. M. S., Winlock, Wash.

Correspondents should be more explicit in describing symptoms. It would be impossible to say what the trouble was. Heavy feeding with lack of exercise will produce leg weakness. A fowl may become so fat and heavy from fat-producing foods and her legs weak from lack of exercise that she is unable to walk. It may be rheumatism. Again it may be due to a heavy male. That often causes a breaking down of the hen. If the hen is over-fat the ration should be reduced for a time and all grain foods fed in a deep litter of straw. Bran mashes should be fed with milk or buttermilk and green cut bone or meat scraps and all the green food the hen will eat. If no improvement results, the hen had better be killed.

J. D.

Poultry in Winter.

To the Editor: Poultry should have plenty of warm water during the cold period. Green feed, such as carrots, turnips, parings from potatoes and apples are fine for the laying hens, but sprouted oats, if one can have them, are better. The incubator should be started in February for the March hatch. MRS. C. A. WALSH.

English in Philippines.

The American public school system in the Philippine islands has so encouraged the use of English, which is the only language taught in the educational institutions established by the Americans, that a long step has been taken toward obliteration of the many languages and dialects among the various tribes, and English is fast becoming the common language for the islands as a whole.

Garden Planning

Profit by Your Past Experience

By Charles Andrews.

In planning your garden for 1917, it will be well to glance back over the last year or two and see wherein you were successful and wherein you failed. Did you have more weeds than vegetables? Did you have enough radishes one week to supply the whole neighborhood and none the rest of the season? Was your garden properly cultivated and fertilized? Ask yourself these questions and many others, and then determine to enlarge on and profit by your successes, and at least attempt to remedy your mistakes.

If you are a beginner at gardening, a few words about the location, soil, fertilizer and drainage may be of some help to you. The best soil for most vegetables is a sandy loam, but this can not always be had. If not, then whatever your soil may be, choose a piece of ground near enough to the dwelling as to be convenient for the housewife but far enough away to be inconvenient for the hens, ducks and geese. It should be a soil that does not bake nor leach, and should be well tilled.

New ground is not really desirable for gardening. If necessary to use new ground, it should be plowed deeply and thoroughly, worked down with harrow and plank harrow until you have a seed bed of well-pulverized soil. This is one of the things very essential to success.

Drainage Important.

Drainage also is an important factor. Sour soil spells ruin for the garden. Subirrigated soil is the most naturally fitted for the growing of any crop, and this is especially true of the garden. But whether you irrigate, have subirrigation or practice dry farming methods, your garden can be made a success if you will use the same care that you give to other crops. It is proven that any ground that will produce good wheat, oats, barley and rye will successfully produce most of the common vegetables. But the fertilizer is the power behind the little seeds that makes them wake up and show their colors. Above all things, don't use fresh horse manure and expect success. Your plants will come up readily enough, but they will mature too quickly and will never have the rich color nor the luxuriant growth and crispness they should have. Why? The fertilizer was too fresh and in the heating process of decomposition killed the tiny rootlets, or feeders, and left the plant to starve to death in a land of plenty. The farmer who does this will declare that it does not pay to raise a garden, and it certainly does not—that way. Had he used a generous coating of well-rotted fertilizer and followed the other principles necessary to success, he would undoubtedly be a devotee of the family garden instead of its enemy. As it turned out, he relin-

All Northwest Egg Contest

J. A. Hanson's Pen of Corvallis Again Wins

The report for the state college at Pullman egg laying contest for December shows that the same positions are held at the end of December by the first three pens as at the end of November. The pen of White Leghorns owned by J. A. Hanson of Corvallis, Ore., was again the winning pen for the month. The fourth pen in November, owned by J. D. Balmat of Spokane, dropped to tenth place in December, the fourth place being taken by the White Leghorn pen of the Oregon Agricultural college, which jumped from eleventh place. Paul B. Towne moved from sixth place in November to fifth place in December, while the Oregon Agricultural college pen of Barred Rocks rose from twelfth place to sixth.

Among the 20 best pens in November, five of them were replaced by new pens in December. The best pen record for December was tied by a Rhode Island Red pen owned by G. M. Brown of Spokane and a White Leghorn pen owned by Wyandotte ranch of Kiesling, Wash., each pen laying 78 eggs, an average of 15.6 eggs per hen.

The individual hen records, Paul B. Towne's White Leghorn hen No. 501 leads all hens with 61 eggs for full period of two and a half months. Oregon Agricultural college Barred Rock hen No. 1275 is second with 54 eggs. The highest individual record for December was made by a White Orpington hen No. 1271 owned by Mrs. W. T. Thompson of Bozeman, Mont., the second highest by a Rhode Island White hen entered by H. J. Kingsburg of Twin Falls, Idaho.

The total number of eggs laid by the 200 hens was 6955 eggs, compared with 6943 in November. Under normal conditions there should be a greater increase than this. The report explains the reason. The weather was cold and sickness or colds developed in the flock. The fact that 40 hens have already died would indicate that the managers have had a rather trying time of it. There is time yet for the hens to make good. Under the conditions of the contest where 10 different pens were put together in one pen, the trouble that overtook the flock last month was almost inevitable, even under the best of feeding and care.

The Hogan Scores.

The 20 hens scored highest by Hogan, ranging from 265 to 235 eggs each, are all lower down than the 20 best record hens for the full period. That is, none of the Hogan best 20 hens are among the 20 that have actually laid the most in trap nests. It would be almost a miracle now if Hogan's 20 best replaced by the end of the year those that are now leading. The report says that "Rhode Island Red hen owned by G. M. Brown of Spokane, Wash., has a total of 46 eggs to her credit since the date of her first egg, November 3. She has set out to utterly run the Hogan party at the all-northwest for Mr. Hogan scored her only 26 eggs in good condition for the year."

Further, when it comes to pens among the 20 highest Hogan pens only two of them appear among the 20 best record pens.

So far the results are not favorable to what is called the Hogan system of selection. As I have said before, it will be a disappointment to every one because we are all looking for an easy method of selecting the best. The best thing to do in the meantime is to withhold judgment.

New Spokane Incubators and Brooders

are sure hatchers. Built to suit Pacific northwest climate. Hot water or electric. Top raises like a lid, permitting turning of eggs without taking from machine. Seven styles and sizes. Prices, $7.50 up. Write for new catalog, which contains new ideas about chick hatching.

Spokane Incubator Company 8429 Haven St. Spokane, Wash.

Garden Planning

Profit by Your Past Experiences

(Continued from preceding page.)

quished his interests in the garden to his wife and declared the garden a nuisance. If your soil is a little sour, a little lime will work wonders with it. Red sorrel is an almost infallible sign of sour soil.

At this early date, however, the very important thing for every farmer contemplating raising a garden is the seed. Don't put this matter off until the last minute and then buy some nondescript seed that may grow and may be what you bought it for, with the chances good that it will at least prove unsatisfactory in some way. Send now for some good seed annual and carefully select the seeds your judgment will tell you are best adapted to your particular requirements. After choosing what you need, make up your list and send for them at once. You will enjoy making up your order now and will be less liable to overlook some of the most important items. When buying seed, do not aim to buy the cheapest, because the cheapest usually proves the most expensive in the end. It is not advisable to pick the highest-priced seeds, either, as they often represent new varieties whose reputation has not been established and which may or may not be any better than the older and well-known kinds.

The satisfaction derived from being able to manage your work so that everything will be done in its season and done well is a just cause for pride. So in planning your garden, keep in mind that it is worthy of your careful attention.

Catalogues.

For 40 years W. Atlee Burpee has conveyed his word of greeting to thousands who have sought information from his seed catalogue. He started out as a boy of 18 and worked faithfully until the end. He wrote last year's catalogue in his own hand and it had gone to press when he died, November 26, 1915. His sons are carrying on his work, assuring patrons of the same real service, in their own words, "A continuance of the policy laid by our father," and issued Burpee's Annual for 1917.

Pratts Positive Proof Offer

$1.85 Value For 50¢

Not a "bargain sale," but the most remarkable offer ever made by any reliable manufacturer of Poultry and Stock Regulators and Remedies. We are making it now—at tremendous cost to ourselves—in order *to give you positive, practical proof of the real merit of our goods.*

We want *you* to give Pratts Preparations a rigid, working test, right on *your own farm* with *your own poultry and live stock.* Thus we can prove to you, finally and conclusively, that it will *pay* YOU to use them regularly. If we did not have *full confidence* in our preparations, did not *know* that they *would* give satisfactory results IN YOUR HANDS, we would not dare make this offer.

Run a comparative test if possible. Handle some fowls and stock the Pratt way—the rest in the same manner as before. Then note the difference in results. When you see that your fowls and live stock are healthier and more vigorous, do better work, are more productive, pay bigger profits when you use

Pratts Standard Preparations For Poultry and Live Stock

you will be convinced because you will have the evidence right before you. The results of the test will carry conviction better than all the arguments or promises we might present. If you really wish to know how to *increase your profits,* just try this plan now.

Take the signed coupon and 50c to any Pratt dealer—there is one near you—and he will give you your choice of either assortment of Pratts Preparations as stated in the coupon.

Each assortment has a retail value of $1.85, but now costs you but 50c. We stand the greater part of the cost, since we credit the dealer with $1.35 for each coupon returned to us.

This Offer Good Only During February 1917

and each household is entitled to use but one coupon. Good only in the United States and Canada.

The goods you will receive are *standard packages taken directly from the dealer's stock.*

We have been in business nearly fifty years and have never before made such an offer. It may never be made again. Your big opportunity is NOW! See your dealer at once.

PRATT FOOD COMPANY, Philadelphia Chicago Los Angeles Toronto

America's Pioneer Manufacturers of Guaranteed Poultry and Stock Regulators and Remedies

THIS COUPON IS WORTH $1.35 TO YOU

Assortment No. 1		Assortment No. 2	
Poultry Regulator	50c	Animal Regulator	50c
Disinfectant	35c	Poultry Regulator	50c
Powdered Lice Killer	50c	Disinfectant	35c

Orchard Pest

Is Described by U. S. Department

An apple pest which, in its attack on the fruit, somewhat resembles the codling moth is described in a new professional paper of the bureau of entomology, bulletin No. 265 of the United States department of agriculture, by E. J. Newcomer. This green worm, known as the dock false-worm, is found throughout the northern section of the United States and is noticeably prevalent in the northwest states. It feeds upon certain succulent plants, such as the docks, knotweeds and bindweeds. When these occur in an orchard the worm makes its way up the trunk of the tree and burrows into the fruit, causing it to rot. There can be little or no danger from this source in clean-cultivated orchards or in orchards where its food plants do not exist. However, where a perennial cover crop, such as alfalfa is grown, other control measures must be taken.

Efficient protection may be secured by banding the trees with cotton batting or with some sticky substance. The lower limbs of the trees should be kept well up from the ground, and any props used also should be banded. Bands should be put on in the latter part of August and left on until after the fruit is harvested.

Grow Alfalfa

In the Orchard If You Have Water

By GRANVILLE LOWTHER.

I have received a letter from Major W. H. Halling of Kennewick, Wash. Mr. Halling says: "I notice in the Farmer your letter about sowing alfalfa in orchards. I have got to do something of the kind, as my water does not get down to where needed most and I thought of sowing alfalfa; but was told, 'look out then for small apples.' I would ask if you sow it all over around the trees, etc., and about how thick?"

What Experience Shows.

My belief is that you are on the right track when you think of sowing alfalfa. This belief is based on experience and observation. My experience in our own orchard I have given in a former issue. My observation covers a period of years and a wide range of territory. The first orchard to which my attention was directed was that of Hon. W. P. Sawyer of Parker, in the Yakima valley. Mr. Sawyer had been for a number of years growing a superior quality of pears that commanded the highest prices in the markets. We all wanted to know how he did it; and a dozen or more went from North Yakima to see Mr. Sawyer's orchard. At that time the trees were 17 years old, and the orchard had been in alfalfa for several years, I do not remember the number, but it seems to me about eight. I have visited that orchard twice since, and I am more than ever convinced that the principal reason Mr. Sawyer excels his neighbors is on account of his alfalfa treatment.

Makes for Quality.

I visited Wenatchee and found there an orchard in which the alfalfa had been growing 16 years, and the quality of the fruit and health of the trees were superior to those in the same neighborhood, growing under similar conditions, except that the others had been given clean cultivation. In every case where orchards have had clean cultivation for a number of years, in this fine volcanic ash soil, they become rosetted, the leaves and branches take on a sickly yellowish appearance, and the fruit is of inferior quality.

I visited Hood River, and found the same results. The Oregon Agricultural college at Corvallis has issued a bulletin on the subject, with specific references to the conditions at Hood River. I visited Rogue River and found the same conditions, except where there was a sandy or gravelly base allowing the roots of the trees to penetrate to considerable depth.

The Same Observation.

I went from Rogue River to Grand Junction, Colorado, and found in every case where the trees had been rosetted on account of the puddling of the soil by irrigation and cultivation, that alfalfa, where it was being tried, was improving the orchards.

I visited orchards near Spokane, and found that in some cases there is a gravel subsoil, and there is no impediment to deep rooting. In other cases there is a hard pan which the alfalfa roots will break up. In others still, there is a substratum of rock not far from the surface, and the alfalfa will not penetrate the rocks, therefore, will not benefit the orchard, ecexpt as it nitrifies and fertilizes the soil.

I have been out over the country at Kennewick, Prosser, Mabton, etc., and I would sow alfalfa.

Will the apples be smaller? No, if you have water enough they will be larger. It takes more water for alfalfa and trees than it takes for trees alone, especially if the lower roots have not been watered; but it will pay in the quality of fruit, the health of the trees and the longer life of an orchard.

Seed It All Over.

I would seed it all over about as thick as if I were sowing for hay. The only exception to this would be in the growing of young trees. A young orchard can be planted in an alfalfa meadow by plowing a strip three or four feet wide in which to place the row of trees. Then each year the strip can be widened by one or two furrows as the roots extend. By the time the orchard comes into good bearing you have plowed up all your alfalfa, the roots have mostly decayed, the soil is fertilized and you have had in the mean time considerable hay. Then sow another crop.

We have nearly ruined some of our orchard in this country by clean cultivation. I would rather let an orchard grow up in weeds, provided every autumn the weeds could be plowed under and the seeds permitted to germinate for another crop of weeds the following year, than to give it clean cultivation.

G. L.

BLACKBERRIES

Advocated for Logged-Off Land.

The culture of Evergreen blackberries is being hailed by members of the Grays Harbor Realty association as an answer to the question of "How can a man make a living on his logged-off land while he is clearing it?" The Evergreen berry grows wild in this section and, when canned, a national market for it is readily found, according to W. H. Paulhamus, head of the Puyallup Fruit Growers' association.

President J. E. Calder of the Realty association has offered to donate 10 acres of logged-off land upon which the association may try the experiment.

Sing as They Fly.

The skylark and the woodlark are thought to be the only birds which sing as they fly.

Eugene Fruit Plant Succeeds

Manager J. O. Holt of the Eugene Fruit Growers' association outlines the work of that organization in handling the fruit and vegetables of the Eugene district through the cooperative plant.

This is the eighth in a series of articles summarizing the addresses and the discussions of orchard problems at the apple conference held in connection with the ninth annual apple show at Spokane in November.

The following is the paper, in part, as delivered by Manager J. O. Holt of the Eugene Fruitgrowers' association before the farmers and orchardists attending the apple conference in Spokane:

In January, 1908, about 80 of the fruitgrowers of Lane county came together and organized the Eugene Fruitgrowers' association, with a capital stock of $5000. The par value of stock was made $10, annual dividends limited to 10 per cent—in practice we pay 6 per cent—and a limit was placed on the number of shares any one person could hold.

Much time was spent studying cooperative fruit associations in the different parts of the country. I believe that the failures were studied more carefully than those which had been successful.

The time at my disposal will not permit a history of the development of our association from a little $5000 concern, with a membership of 80, to a $50,000 corporation with a membership of more than 600, and doing a $350,000 business.

I have known our board of directors to work all day and sometimes far into the night, over important problems confronting the association, yet I have never known them to adjourn until every member was behind the decision of the board.

Our policy has been conservative, we have had a definite plan from the beginning and we have followed it out, step by step, as we were able.

Our first aim is to handle all the fruit possible in the fresh state. When fruit is delivered, that part which is suitable for fresh shipment is sent direct to the packing department and that not suitable for that department finds its way to the place where it will bring the best money. Take apples, for instance, the best are delivered to the packing house, those sorted out here will go to the cannery, if of suitable size and variety, if not, they find their way to the dryer or, as a last resort, to the vinegar plant. The peelings and cores are used for making cider for vinegar, or jelly stock. All of these departments are either under the same roof, or connected by tramways so that transfer is made with the least possible expense.

Our canning department occupies about 20,000 square feet of floor space

Ancient Farming

Herodotus, in the year 450 B. C., said that good cultivation yielded two-hundredfold in the Valley of the Euphrates. Even in that land of Eden, poor cultivation yielded but fiftyfold.

In 1898, the average Wheat yield per acre in New York State was 21.2 bushels; in 1907, 17.3 bushels per acre; in 1912, but 16 bushels.

European yields are more than double.

Isn't it time for our farmers to get down to business methods? Home Mixed Fertilizers will help.

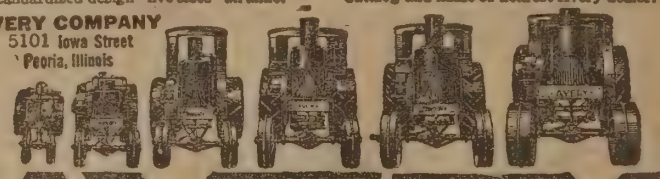
The Only Tractors With Renewable Inner Cylinder Walls



With an Avery Tractor if your cylinders become worn or scored all you have to do is to put in new cylinder walls. But with all other tractors you must have your old cylinders rebored and fitted with oversize pistons and rings or buy complete new cylinders, either of which is very expensive and causes serious loss of time.

OTHER THINGS YOU GET ONLY IN AN AVERY

Only Averys have sliding frame, two speed, all spur gear, four wheel, double drive transmission. Only Averys have no fan, no water pump, no fuel pump, no outside lubricator, no belts, no sprocket chains. Only Averys have a standardized design—five sizes—all alike.

The Avery line includes five regular size tractors—8-16, 12-25, 18-36, 25-50 and 40-80 h.p., and special 5-10 h.p. Plows and Threshers in all sizes—and Two-Row Motor Cultivator. Write for a free copy of the new 1917 Avery Catalog and name of nearest Avery dealer.

AVERY COMPANY
5101 Iowa Street
Peoria, Illinois

AVERY

Tractors and Plows—6 Sizes—Fit Any Size Farm

and has a capacity of 1000 cases of canned fruit per day during the busy season. The season opens at Eugene about the 15th of May with gooseberries and rhubarb, strawberries coming on the latter half of the month. By the first of July we will be canning, in addition to strawberries, red and black raspberries, Logan berries, red, black and Royal Ann cherries, and we will have a hundred women and 45 or 50 men employed. The dryer is started about this time on Logan berries. The latter half of July finds us busy with beets and first deliveries of string beans. Bartlett pears and blackberries begin to come in after the middle of August. September sees the last of the pears, string beans and plums. This is the month for shipping early apples and drying prunes. During October we are packing dried prunes, canning apples, tomatoes, pumpkin, shipping apples, and making cider, kraut, etc. The past season something was canned every month in the year.

Dried Fruit Department—Our evaporator is one of the largest in the state. It is of the tunnel type, having 39 tunnels holding about 4500 trays, and has a capacity of 1000 bushels per day. Although built primarily for prunes, it is used in July for Logan berries and sometimes late in the fall for apples.

The evaporator is connected by tramway with the dried fruit packing department. We handle here the products of several dryers of our members, as well as our own. This building is three stories high. The dried fruit is elevated to the third story where it is graded, each grade passing to bins on the second floor. From here it is run through the processor, where it is thoroughly sterilized and washed with live steam and hot water. It now goes back to the first floor where it is packed hot in tight boxes lined with oiled paper and is ready for the market. We market from $50,000 to $75,000 worth of evaporated fruit each season.

Cider, Juice and Vinegar Department—Our press room has a capacity of 2500 gallons of cider or 1500 gallons of Logan berry juice per day.

We made about 15,000 gallons of Logan berry juice the last season. This is put in containers of suitable size, sterilized and stored. Later it is prepared for the market, either as a beverage, concentrated, or fountain syrup.

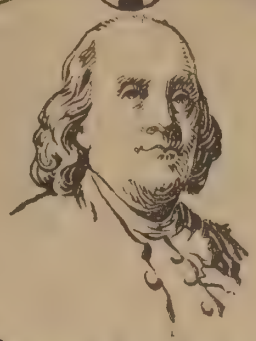
We are not favorably situated to develop a large vinegar business on account of freight rates. Consequently we only make about 25,000 gallons a year. Cider for this is stored in large tanks for the alcoholic fermentation, and about the first of the year the generators are started and, of course, run night and day for the next six months. After the vinegar is made it is filtered and blended to standard before marketing.

The best cider is put on the market sweet, both canned and bottled. This is thoroughly filtered and sterilized and will keep indefinitely. We will dispose of something like 20,000 gallons of cider annually in this form.

Boiled cider, jelly and similar products are given some attention. Altogether we use about 400 tons of apples in these operations, which would otherwise be of little value.

Cannery—Our canning department occupies the largest amount of floor space and employes the largest number of people. It is operated almost every day from May to December and intermittently the remainder of the season.

The "peak of our load" comes about the 4th of July, canning raspberries, loganberries and cherries, when we will pack 25,000 cans a day.



During the past season we canned 150,000 pounds of red raspberries, 400,000 pounds of loganberries, 500,000 pounds of cherries, 15,000 pounds of gooseberries, 250,000 pounds of blackberries, 400,000 pounds of pears, 30,000 pounds of plums, 25,000 pounds of rhubarb, 250,000 pounds of beans, 160,000 pounds of beets, etc.

The past season we used 1,000,000 tin cans, three cars of sugar, 50,000 boxes and several tons of salt. During our busy season our payroll is about $2000 per week.

We try to do a little experimenting and, if possible, add some new feature each season. We have done very little work with glass yet, but indications are that we will be forced to enlarge this department before long. The past two seasons we have bottled considerable loganberry juice and cider, both sweet and carbonated.

Spray Plant—We make our own lime-sulphur spray during the winter months when other departments are more or less idle. We have a small plant with a capacity of about 20 barrels of 30-degree test spray each day. Our people use 400 or 500 barrels each season.

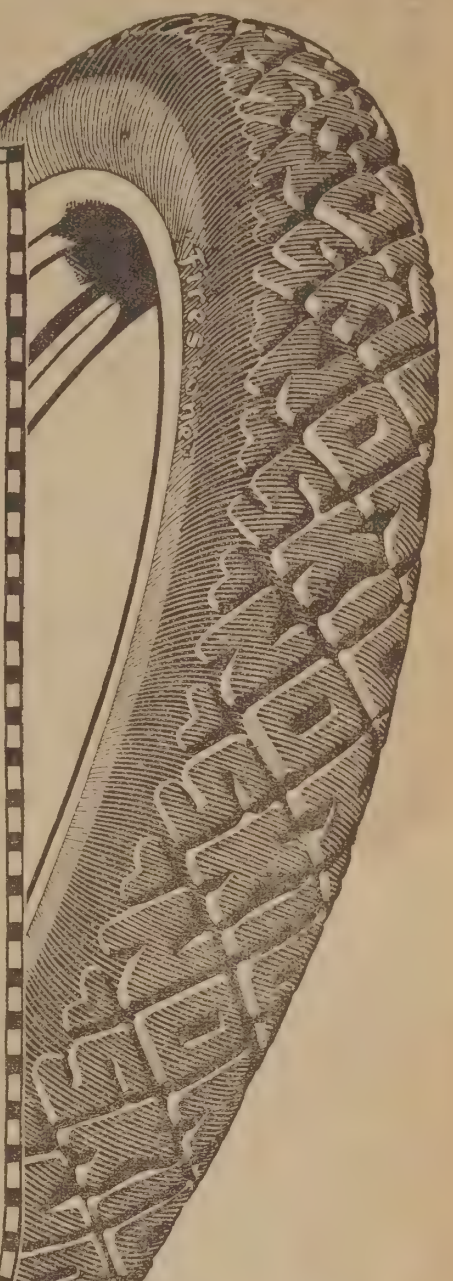
We handled 30 different varieties of fruit and vegetables the past season and put it out in something like 100 different styles and grades.

"A Word to the Wise is Enough"

Benj. Franklin

AND when you're buying tires follow Poor Richard's advice and say only the one word, "Firestone." This word is not only the name of a tire foremost in quality, it is the name of a man who is personally responsible for that quality, which means safety, comfort, mileage, for you.

The vital strength of Firestone Tires makes them oppose equally the tug of rough roads or the test of friction when you "let her out" on smooth stretches.



The Firestone Non-Skid Tread means extra rubber. Those angled letters not only hold the car true in slippery going and protect against skid, but there's "comfort value" in the added rubber piled onto the regular tread.

And because volume of sales (over 33,000,000 dollars last year) and efficient factory methods lower production cost, you get Firestone Tires at only average price.

Your dealer can supply you promptly. See him today.

Buyers' Guide The Advertising Columns of this paper make up a valuable guide for those who do the buying for the farm or the home. Our readers will confer a favor by mentioning this paper when writing advertisers.

"This is My Choice of Seven Makes,"

1000 in use

says A. J. Hurtig of Ogilvie, Minn.

Please read this letter—

"I am very much pleased with my silo. The material is good and plenty of it. No trouble to erect same. If farmers intending to build a silo had chance to see your frost-proof, am sure they would not buy any other make regardless of price. **I had a chance to investigate seven different makes before placing my order with you, but it did not take much time for me to decide after I had seen the merits of your frost-proof.**

"Yours truly, A. J. HURTIG, Ogilvie, Minn., Oct. 26, 1916."

Silage Can't Possibly Spoil!

Our patent double wall is the only type of wooden Silo that absolutely excludes air. Buy H-L-F Silos and you won't have a pound of spoiled silage around the edges. The free folder tells why.

Order Early. Get FREE ROOF

The H-L-F is sold direct from factory—*at factory prices.* You save at least $100. Big sales enable us to give carload price on single order. Order now for spring delivery and get FREE ROOF.

Mail coupon—big silo folder FREE

FREE folder gives details of air-tight feature, illustrates the everlastingly strong construction, tells names of nearby owners, explains how you will save *big money. Send coupon now—while it's handy.*

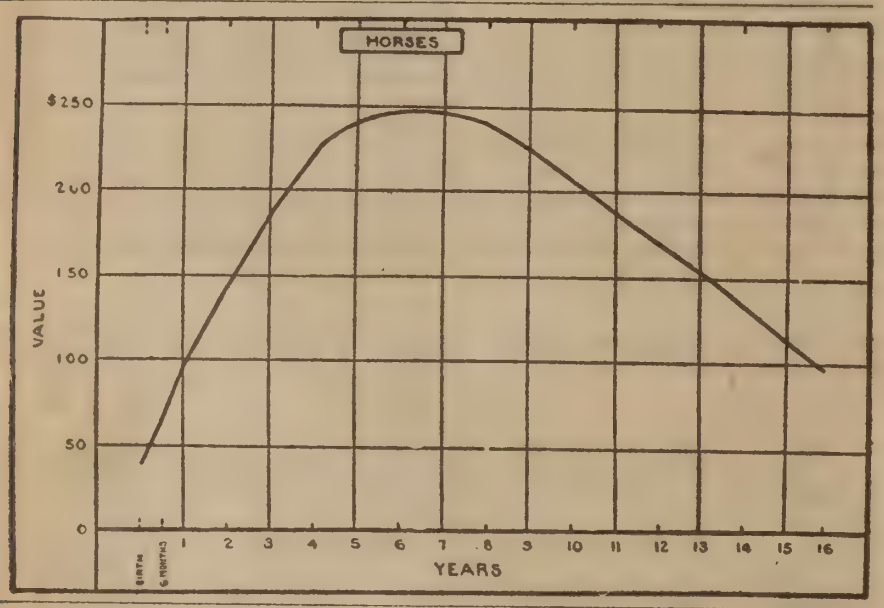
Farm Work Horse Values

Influence of Age as Shown by Estimates

of 147 estimates by owners, based on arbitrary values, showing the influence of age on values of farm work horses:



Age.	Maximum value, $250.	Pct. of maximum value.
Birth	$ 39	16
6 months	63	25
1 year	96	38
2 years	142	57
3 years	185	74
4 years	220	88
5 years	242	97
6 years	248	99
Maximum	250	100
7 years	247	99
8 years	241	96
9 years	227	91
10 years	209	84
11 years	190	76
12 years	174	70
13 years	154	62
14 years	137	55
15 years	119	48
16 years	101	40
No. of estimates...	147	....

Those who have occasion to buy or sell live stock are constantly confronted with the problem of weighing the money factors influencing the value of farm animals. Of these factors, the age of the animal is one that applies directly to the value of dairy cattle and farm work horses. While age is not the only factor affecting the value of these classes of animals, it is one of the most important. In determining the value of farm animals grown for meat only, which are ordinarily disposed of at an early age, this factor is comparatively unimportant.

By means of personal visits and through correspondence with many of our best informed farmers and live stock breeders, the office of farm management of the United States department of agriculture recently attempted to get reliable information concerning the influence of age on the values of dairy cows and farm work horses, says J. C. McDowell in a bulletin just issued. Farm management investigators have found that for farm data the average of a large number of estimates is almost as accurate as that of carefully kept records, provided the estimtes are given by men who thoroughly know the subject under consideration. In this case the estimates secured by correspondence agree very closely with those secured through personal visits. While figures concerning the values of dairy cows and farm work horses were obtained from nearly every important agricultural district in the United States, most of the estimates were secured from New York, Pennsylvania and the north central states. In this work appreciation and depreciation were based on age only. In order to eliminate everything except age, the animal was assumed to be in perfect health and to have a fixed value at a certain age. No attempt was made to find the actual value of animals belonging to any breed. Arbitrary values were assumed for a certain fixed age, merely to get a starting point from which to work.

The farm work horse was assumed to have a maximum value of $250 when in his prime, which is a fair price for a very good farm horse. Brood mares were excluded, as their value is not necessarily the same as that of animals kept for work only.

According to these figures, the farm work horse reaches his maximum value at some point between 6 and 7 years of age. If still in health, his value at 16 years is 40 per cent of his maximum value. At birth he is worth 16 per cent of his maximum value, and there is little change in value between the ages of 5 and 9. As compared with the values given for purebred dairy cows of about the same maximum value, the birth value of horses is considerably less, the age of maturity a little later, and the old-age value somewhat higher.

Trading Company

Officials on Trial in U. S. Court

(Continued from page three.)

glowing reports of its success. He cited the organization of a branch of the concern in Portland, Ore., and of the Inland Mercantile company and the Iowa Mercantile company as auxiliary or contributing companies in the alleged fraudulent scheme. He charged that under the stock selling plan a commission of 25 per cent was paid; that the concern represented that it always bought its merchandise for cash and sold for cash, while as a matter of fact it bought heavily on credit and at the time of its failure in 1915 had outstanding debts of $70,000, which had been accumulating during all the years of its existence.

Attorney Garrecht also stated that in 1914, the year before the trading company went into bankruptcy, its president, Gale Smith, one of the defendants, induced the farmers' union and the state grange to give its indorsement to the company, which they did through a committee of investigation, including State Master C. B. Kegley of the grange. John C. Lawrence, stated the attorney, was employed at a salary of $50 a week to go among the farmers and solicit their patronage of the concern in the way of stock buying, and one of the charges against Lawrence is that he knew at the time of such solicitation that the company was insolvent. It is further claimed that President Smith, who began at a salary of $60 a month in 1909, was raised to $500 a month shortly before the filing of bankruptcy proceedings.

Claims of the Defense.

Attorney Robertson of the defense, in stating his case, said that it would be shown that the company had been organized in good faith to fill a long felt need among the farmers for a mutual trading concern, and that at no time had the conduct of its affairs been carried on with fraudulent intent.

"The Bull with the Bull"

The Tractor That Does Things

Here's what a Big Bull Tractor is doing for Mr. Bert Hilke, Independence, Oregon:

"I must say that the Bull is O. K. in every way, as I can do my work at the proper time when it should be done, and more of it. * * *

"This spring I hauled a disc and 8-foot roller directly behind the disc, which gave the clods no chance to dry out and harden, as they would by working with horses.

"I also use the Bull for filling my 30-foot silo. A neighbor said if my Bull would pull his Blizzard, it would be the first tractor he ever saw do it—and he saw it. Now I have the job to fill his silo and earn enough to pay for filling mine."

Kerosene or Gasoline

You get, in the "Big Bull," a sturdy light-weight, self-steering tractor that delivers full 10 H. P. at the draw-bar and 20 H. P. at the belt, that is most economical in fuel and upkeep cost and is backed by a real service.

Don't wait till you "simply have to have" a "Big Bull." **Order it Now.** There is a distributor at your farm implement trade center.

Less work and bigger crops with Planet Jr. implements

"No gardener would do without a No. 4 Planet Jr if he would but try it. I would not take ten times its price and do without it," writes Isaac Kennedy, Owensboro, Ky.

Planet Jr implements are so well made that they not only do good work, but they last a lifetime. Fully guaranteed.

No. 4 Planet Jr Combined Hill and Drill Seeder, Wheel-Hoe, Cultivator and Plow does garden work so quickly, easily and thoroughly, that it pays for itself in a single season. Sows all garden seeds (in drills or hills) plows, opens furrows and covers them, hoes and cultivates all through the season. 32 other styles of seed drills and wheel-hoes—various prices.

Planet Jr **No. 8 Planet Jr Horse-Hoe and Cultivator** does a greater variety of work and does it more thoroughly than any other cultivator ever made. It has stronger, better construction. Its depth regulator and extra-long frame make it steady-running. Adaptable to deep or shallow cultivation and to different widths. 15 other styles of one-horse cultivators—various prices.

No. 4

S L ALLEN & CO Box 1107P Philadelphia

72-page Catalog, free!

Illustrates and describes over 70 tools for farm and garden including Seeders, Wheel-Hoes, Horse-Hoes, Harrows, Orchard-, Beet-, and Pivot-Wheel Riding Cultivators. Write postal for it today!

We carry stock in Los Angeles. Agencies in all principal Pacific Coast cities.

Gets Every Weed

Mulches and pulverizes, with greatest ease in handling and working. The

"Acme" Foot Lift Weeder

destroys all weeds, cutting deep as desired, and tills perfectly. It's knife edges, presented to the ground at a slicing angle, make draft easy. Foot lift lever clears off the weeds and lifts the blades for transportation. 5 sizes, cutting 5 ft. to 12 ft. wide. Write today for book, "*The Acme Way to Crops That Pay*". Describes the entire "Acme" line.

Wilson Startles World

Wants U. S. to Help Enforce Peace

President Wilson last week sprung the most sensational surprise of his administration in the view of many when he appeared in the United States senate and delivered an address in which he outlined what he conceived to be the part of this country in perpetuating peace when the European countries bring their colossal warfare to an end. It was a frank declaration of what he conceived to be the demand of all civilized peoples, a universal participation in a worldwide league to enforce peace. Four chief points stand out in the message which he gave to the world:

1. That a lasting peace in Europe can not be a peace of victory for either side.

2. That peace must be followed by a definite concert of power to assure the world that no catastrophe of war shall overhelm it again.

3. That in such a concert of power the United States can not withhold its participation to guarantee peace and justice throughout the world.

4. That before a peace is made the United States government should frankly formulate the conditions upon which it would feel justified in asking the American people for their formal and solemn adherence.

The president's address was received with a great variety of approval and of disapproval. His humanitarian declaration that peace must be a peace "without victory" stirred some of the foreign diplomats now empassioned by the prosecution of the war to vigorous denunciation and ridicule. Others of the belligerents commended his idealism, but declared it impracticable. Others expressed hope that it might see fulfillment.

In this country sentiment was as varied. The president's belief that the United States should take a leading part in the organization of a worldwide league to enforce peace found both favor and disfavor. Opponents of the plan declare that such a move would tend to place the United States in "entangling alliances" with European powers, which since the time of Washington have been avoided. They forecast the possibility that at some future time the armies and navy of this country might be called into service to force a peace broken by European countries who declined to abide by the terms of the league. On the other hand, many express the belief that the president's words of optimistic idealism will exercise an influence that will hasten the restablishment of peace, and go far toward bringing the nations of the world to a realization of the present possibility of joint acceptance of the terms of humanitarian civilization.

Railroad Case Still Waits.

The case in the United States supreme court over the constitutionality of the so-called eight-hour day law passed by congress last fall to avert the threatened railroad strike is still undecided. In the meantime, Representative Adamson, who drafted the original measure whose constitutionality is attacked, is working under the president's direction in the preparation of supplementary legislation designed to guarantee the nation against railroad strikes.

It is proposed to create a commission with power to settle disputes between the railroad companies and their employes. Another proposal, which, however, seems to be likely to fail of serious consideration, is the appointment of a commission madeup of railroad representatives and train operators, whose decisions should be binding upon both companies and operators. Legislation looking toward compulsory arbitration continues to be talked, but is not rapidly taking definite form.

Wages Are Increased.

Secretary Wilson of the U. S. department of labor has issued official statement that during November and December last 526 establishments doing business in 38 states increased the wages of their employes. Such increases ranged from 5 to 10 per cent, and affected more than a million workers. Of the companies which increased wages, 244 did so voluntarily, said the statement.

Charges of Bribery.

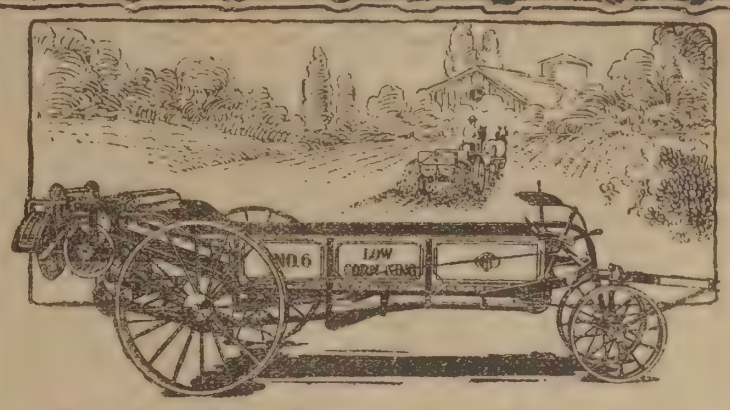
The grand jury sitting in Seattle, Wash., has returned indictments against Mayor Hiram Gill and other officials charging them with having conspired to violate the prohibition law. Bribery, or attempted bribery, is charged. The charges say that the officials conspired to admit quantities of intoxicating liquor to be acquired by Seattle individuals in violation of the law.

Mayor Gill yas once recalled by the people of Seattle when sensational charges were made against him at the time his chief of police, Wappenstein, was charged and found guilty of accepting bribes from immoral resorts in return for protection. He was later nominated and reelected to the position from which he had been recalled. He was talked of as a republican candidate for governor during the last campaign.

Army Coming Home.

General Pershing's army is coming home from Mexico, hither it was sent several months ago to capture Villa, the Mexican marauder bandit, "dead or alive." The U. S. Army was sent to Mexico following Villa's raid on the United States city, Columbus, when several American citizens were killed. Failure of the U. S. and the government of Mexico to reach agreement has resulted in the recall of Pershing and his troops.

COOPERATION
Is Given Attention in Okanogan.



Cooperative creameries is a project which at present is occupying much of the time and attention of County Agent H. P. Smith of Okanogan. One has recently been started at Tonasket, and is running on a profitable basis, opening a market to the home dairymen of the district. Farmers are increasing their herds, and plans are under way for the opening of creameries at other points. Cooperative shipping of live stock is another Okanogan project of importance, one association during the past two months having netted an increased price for their stock totaling $3300 above what could have been secured through regular marketing channels.

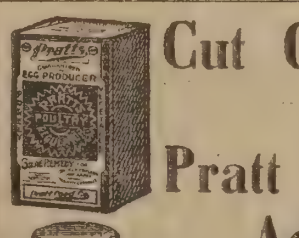
CONDENSING PLANT
Largest of Its Kind in State.

A new milk condensing plant which, it is claimed, will be the largest institution of its kind in the state, will be erected at Mount Vernon, Skagit county, Wash., according to the Argus. Albert Daub, a former Alaskan, is a principal in a deal by which he has secured a tract of about three acres where the new condenser will stand. Mr. Daub also says that certain former directors and employes of the Borden company will be interested in the new concern.

Salmon Twine.

Gillnet salmon twine has reached $3 per pound, so the fish twine buyers inform us. This makes a gillnet equipment very costly, and the chances are favorable to a lessening of that class of gear and adoption of trolling.

Settle the Spreader Question



THE farmer who uses a **Low Cloverleaf, Low Corn King** or **Low 20th Century spreader** these days is the man who makes the most money. His land increases in value when regularly fertilized. His crops grow better in quality and larger in yield when supplied with available plant food. Of all the spreaders on the market, the **Low Cloverleaf, Low Corn King** and **Low 20th Century** come nearest to doing this work as it should be done.

It is a long jump from the ordinary machine to the modern low spreader with its double beater and wide spread. Every farmer who knows the value of good spreading is buying one of these wide spread machines. As a matter of fact, no farmer can afford to buy any other kind, because the saving of time and labor and the better job of spreading done by a **Low Cloverleaf, Low Corn King** or **Low 20th Century** makes them worth more than ordinary spreaders.

Complete information about these machines is worth money to you. Drop us a line at the address below and we will show you very plainly why it will pay you to buy a **Low Cloverleaf, Low Corn King** or **Low 20th Century** spreader.

160 ACRE FARMS IN WESTERN CANADA FREE

Canada's Liberal Offer of Wheat Land to Settlers

is open to you—to every farmer or farmer's son who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is much higher but her fertile farm land just as cheap, and in the provinces of Manitoba, Saskatchewan and Alberta

160 Acre Homesteads Are Actually Free to Settlers and Other Land Sold at from $15 to $20 Per Acre

The great demand for Canadian Wheat will keep up the price. Where a farmer can get near $2 for wheat and raise 20 to 45 bushels to the acre he **is bound to make money**—that's what you can expect in Western Canada. Wonderful yields also of **Oats, Barley and Flax. Mixed Farming** in Western Canada is fully as profitable an industry as grain raising.

The excellent grasses, full of nutrition, are the only food required either for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent. Military service is not compulsory in Canada but there is an unusual demand for farm labor to replace the many young men who have volunteered for the war. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

Why He Didn't Get Eggs

There Were a Lot of Chickens Sitting Around

By CHARLES HENRY STEVENSON

I was over to Mr. Mutting's place yesterday. He lives down by the river, 10 miles from me, and I do not see him very often. Among others things he has some very fine pears. They are the kind that my wife likes best. She says the kind that she likes best are those that have so much juice that it runs down her arm and drops off her elbow.

After eating all I could Mr. Mutting filled my pockets with pears to take home. Then, as I was going away, he wanted me to see a fat pig he had and after that we looked around the place a little.

As we walked through the orchard I noticed that it was an ideal place for poultry. It was so nicely protected by a high bluff to the north, and also by the trees.

There were a lot of chickens sitting round, so I asked Mr. Mutting what he fed his hens. He replied that he generally gave them a big, cold mash of shorts, sometime in the morning when he got around to it. When he was in a hurry or out of shorts he gave them rolled barley.

When I asked him what he fed at night he replied, "Nothing, they do not need anything when going to roost." I also learned that they roosted in the trees and that he had lost a number from having their feet frozen during the cold spell.

I did not need to ask if he got any eggs. I am not a poultry expert, but I think I know enough about hens to be sure that his way of feeding and caring for his hens would guarantee no eggs.

Mr. Mutting has his own ideas about things and, like a lot of us farmers, he is a little hard to convince against his will. One of his hobbies is the elimination of the middleman. He claims that the middleman is the farmers chief enemy and the principal cause of the high cost of living.

I knew better than to attempt to argue with Mr. Mutting, but during my ride home I got to wondering if we farmers did not make a mistake in not putting in more of our time in fighting some of our enemies nearer home.

Now, I get enough eggs, during the winter, to supply all our needs and have quite a few to sell. It does not take much time and does not cost much. In fact, I think there is most profit in our winter eggs.

Any farmer could have as good a chicken house as mine. It is 10x30 and has a shingle roof, for the hens must be kept dry. The walls are 1x12 rough and the cracks are not battened for my hen house is protected from the winds. If it were not I would batten the cracks and put in cheese cloth windows for hens need plently of fresh air, but no draft.

One-half of my hen house is really a shed, opened to the south. In feeding my horses and cows I do not force them to eat all the alfalfa stems. There is not much food value in those woody stems anyway, so I do not think it pays to make the animals eat them. I save all these alfalfa stems and once a week I clean out my scratching shed and put in about a foot of the clean stems.

Early in the morning I feed my hens a rather light feed of wheat. I just sow it all over the alfalfa stems and, of course, it nearly all disappears among the stems. But the hens go after that wheat for all they are worth, and there, protected from the wind and damp, they scratch all day in the deep litter for the wheat.

> I thought I would ask him just to see what he would say. He looked at me in amazement. "Eggs in the winter," he said. "I have 150 hens, and I don't get any eggs, but neither do I get any pears in the winter."

At night, if it is very cold, I give the hens a hot shorts mash. If it is not cold I give them some grain, but I always try to fill them up without having any left. I always see that they have clean, fresh water and warm water if the weather is cold.

I only keep 50 hens during the winter. I haven't time to take good care of more and I think 50 hens, well cared for, will pay a farmer better than 150 neglected.

During the spring and summer, when they are not much care, I raise a lot of chickens so we will have plenty to eat. Then, in the fall, when they can be fattened most cheaply, I fatten and sell all but 50 of the most promising.

Mr. Mutting believes that the only thing that prevents him getting eggs in the winter is the cold weather. I believe that his method of feeding and caring for his hens is the principal reason why he gets no eggs in the winter.

There is no mystery about getting hens to lay. In the spring there are lots of sprouting seeds of weeds and grains as well as bugs in the earth. The hens are very fond of this kind of feed and will scratch for it. This exercise is essential to a laying hen. There is usually enough of this feed so that the hen goes to roost with a full craw, which is natural for all fowls.

In the fall, when nature supplies most feed, all kinds of fowls put on fat for the reason that they do not have to hustle for their feed. It is Mother Nature's way of preparing them for winter. All animals are inclined to put on fat when they do not exercise.

So I think that if my neighbor would shut his hens up in the summer time so they could get no feed and then give them only a big shorts mash in the morning and at very irregular hours and let them go to roost with empty craws he would get very few eggs even in warm weather.

More Elevators

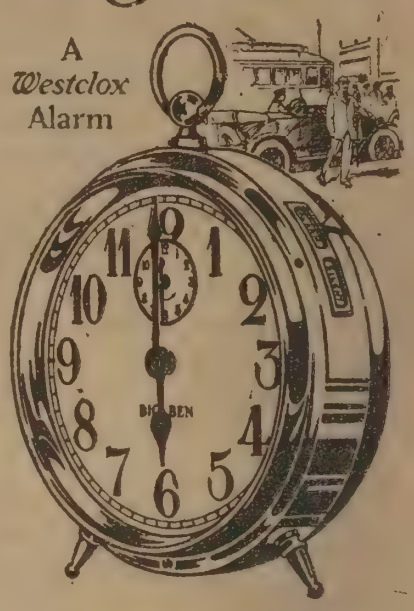
Are Needed to Handle Grain

Portland Oregonian: Public attention is directed to Portland's need of improved facilities for shipment of grain by Mr. Hegardt's report on the changes which are making in methods of grain handling. The days of sacked wheat stored in interior warehouses, shipped to the Coast in open cars, again stored in warehouses and then loaded in sacks on sailing ships for the long voyage around Cape Horn to Europe have passed away. Elevators are being built in the grain belt to handle wheat and other cereals in bulk, rail transportation in bulk has begun and elevators have been built at Seattle and Vancouver, B. C., for loading in bulk on board ships. The higher price of sacks and the difficulty of obtaining them have called the attention of farmers to the fact that, since the opening of the Panama canal and with the rapid passing of the sailing ship, sacking is no longer necessary and has become a needless expense.

Sacking of grain was made necessary by the manner in which it was exported. Grain was loaded on sailing vessels which were often becalmed for many days in the tropics, during which period the grain would "sweat." Thence the ships passed through the almost arctic seas of Cape Horn, where there was danger that storms would shift a bulk cargo, then northward to pass again through the tropics before they entered the temperate zone in the north Atlantic. Even had there been no danger of "sweating," methods of stowing cargo were not so well perfected that men were willing to risk loss of crew, cargo and vessel by the listing of the ship in a storm.

Change has at least minimized these considerations so greatly that they no longer control. The Panama canal has reduced the time which a ship spends in the tropics and has eliminated the perilous passage around Cape Horn. Grain is loaded more and more in steamships, which can proceed in calm or wind. Sailing ships are built with auxiliary engines, which keep them moving in calms. Shifting boards are used to make a bulk cargo safe. The transition from sack to bulk shipment is now mainly a matter of providing port facilities for loading grain and shipboard in the latter shape and of overcoming the proverbial conservation of the farmer. It is probable that the latter will abandon sacks as fast as the ports provide facilities for bulk shipment.

Percherons Raised on Alfalfa Hay



To the Editor of The Farmer: These are my Percheron mares. Their names are "Doll" and "Lill," aged 5 and 4 years, being full sisters. They weigh 3800 pounds and possess good life, action and quality and have been fed almost exclusively on alfalfa hay. They seldom get any grain and rough it in the corral when not in the harness. I find it cheaper to raise this kind than to buy them.

Parma, Idaho. W. J. SIMPSON.

Big Ben

A Westclox Alarm

SIX A. M. for the big man of business—who knows the luxury of ample time—who's up before duty insists. Try Big Ben in the business of living. Set him a little ahead.

Five Books Free

DO YOU want to save money on your stump blasting? Do you want to get the stumps out cleaner—split them up better—and cut down the quantity of powder required? Our Stump book, "Better Stump Removing," tells and shows how to do it.

OR do you want your fruit trees to grow faster, yield sooner and bear bigger crops. Our Tree book, "Better Orchard Tillage," shows how you can secure these results by blasting when planting.

IF you want to save fertilizer and grow bigger crops, send for our Crop book, "Better Farm Tillage." It tells how blasting will make the subsoil mellow several feet deep and release new plant food for your crops.

ARE there rocks on your farm? Our folder, "Better Boulder Breaking," shows how a few minutes' work will get them out of your way forever.

DOES your farm need draining? Our Ditch book shows how to blast clean, smooth ditches of any size—the easiest, quickest way of making them.

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

Here are some of the reasons why you should insist upon Giant Farm Powders for all farm blasting.

1. They are made especially to suit Western farm conditions, by a Western company with 50 years' experience.
2. They are the *genuine* Giant Powders—the product of the manufacturers who originated the name. The fact that other explosives are often called "giant powders" indicates the high quality of the genuine.
3. They go further than ordinary dynamites. They exert their strength over a wide area, cracking, splitting and heaving out stumps, roots and all, rather than shattering and throwing them high in the air.
4. They will not freeze at ordinary temperatures, standing 32° for days without requiring thawing.
5. They are being used by thousands of farmers, scores of whom state that the Giant brands "give better results"—"save money"—"have wider breaking power"—"shoot the roots"—and "are always uniform in strength and action."

There are two of the Giant Farm Powders: Giant Stumping Powder, for wet work, and Eureka Stumping Powder, for dry work. Eureka costs less and many careful blasters use it for wet work, too.

Ask Your Dealer

Your local dealer probably has Eureka and Giant Stumping Powders and other Giant blasting supplies. If he does not have them, write us. We will see that you are supplied promptly through the local dealer with whom you prefer to trade, through a dealer in a nearby town who has a magazine, or direct from our nearest distributing point.

The Giant Powder Co. Home Office **San Francisco**

CONSOLIDATED *"Everything for Blasting"* ESTABLISHED 1866

Branch Offices: Seattle, Spokane, Portland, Salt Lake City, Denver

Mail the coupon below or a post card and get one or all of the Giant books. You will find them valuable. They contain illustrations of the most economical ways of doing farm work with Giant Farm Powders.

Make This Test

Get a 25 or 50 pound case of either of the Giant Farm Powders. Get at the same time a case of any other dynamite or stumping powder.

Blast with each. Keep track of the quantities used. Figure the cost. You will find—as farmers everywhere have found—that the Giant Farm Powders save farmers time, work and money.

To make it easy for you to secure Giant Farm Powders, we print a trial order form in the coupon at the right. Fill it out, and we will have our nearest distributor supply you with a trial case at the lowest market price.

Live Farmers

Are Found in Wahkiakum County

(Continued from page five.)

cled. and we learned literally what it means to "put our shoulder to the wheel. But there is much satisfaction in doing what everybody tells you can not be done.

Skamokawa in the Indian tongue means fog, and it is not hard to see where the town got its name. Behind it are two valleys, and up these valleys there must be a fog factory. At a distance, as the fog pours out, it is like a silent waterfall, or the steam from some mighty engine of nature. From Skamokawa we proceeded through a blanket of fog to the West Valley school and went on low most of the way there and back, for the sake of the lights.

The following families were represented at the meeting: Matt Hogan, Aaron Peterson, George Birell, George Constable, Otto Hampson, J. Lott, M. Kelley, J. W. Olson, Andrew Peterson, B. C. Bjornsgard, Mrs. E. L. Hampson. There were 24 present.

Professor Price was the speaker of the evening. His talk was informal and extremely practical. It was along the line to economical feeding for the dairyman, and he avoided technical terms and technicalities, sticking to actual work done and how it is done. The necessity of the balanced ration was made plain, and following this the importance of finding the constituents of the balanced ration in the feeds at hand. True economy is feeding not only the right elements in the right proportions, but in finding them in the feeds produced on the farm or inexpensive in cost and combining them in the right way. He dealt at some length with the feeding of calves, indicating how skim milk is introduced in their ration without injury and what to do for ailments of calves in some instances. After he finished his address some questions were asked and a short discussion took place.

The following afternoon the same party, augmented by Miss Sutherland, went from Cathlamet to Skamokawa and thence to East Valley, to the beautiful farm home of Mr. and Mrs. Strong. This home Miss Sutherland referred to later as one of the perfectly appointed homes she had found.

The following people gathered to hear Miss Sutherland speak: Misses Marion Morril, Emily Bjornsgard, Etta Eleason, Ella Benson, Christina Bergman, Blanche Martin, Gertrude Peterson, Hailie Patterson, Winnie Patterson, Ida McEvoy, Grace McIntyre, Esther H. Strong, E. Eleason, Loida McEvoy, Maybelle Andrews; Mesdames F. Koblitz, J. H. Johnson, Nels Peterson, Lillie Barnes; Messrs. Charles H. Strong, John McEvoy, Martin Peterson, W. J. Strong.

Those who attended the meeting in the East Valley at the evening meeting, besides those who attended in day time at J. W. Strong's residence, were Alex Campbell, Theodore Anderson, O. P. Bjornsgard, John Elleason, H. E. Elleason, Joseph Bergman, J. H. Martin, L. J. Johnson, Charles Strom, John Benson, A. Anderson and Simon Varnson.

Because carrying much equipment is difficult over rough and muddy roads, Miss Sutherland took as a subject, "Serving." She said that many people thought this a small and superficial thing, but it is not, for it gives to girls what they may lack otherwise—that poise which they seek, which comes with the sure knowledge of what is right and proper and which is present if one does not know. It is the difference between ease of manner and certainty of conduct and embarrassment. The proper appreciation of so-called little things is recognized by men and women of fame and standing. The proper appreciation and use of correct serving aids digestion and promotes long life. She explained that the tendency nowadays is toward simple ways of serving and the doing away with servants. Every correct rule for service is based on a sensible reason. While she spoke she spread a table and illustrated what she had to say.

Of course, the ladies were much interested, and it was noticed that the men crowded around the open doorway and listened intently.

Thursday afternoon Miss Sutherland spoke before the high school girls at Cathlamet, devoting her time to the art of millinery. It would be impossible to reproduce this talk, for her fingers were busy as she spoke and from them grew flowers and other hat ornaments, hat frames—illustrating what she said. Perhaps the keynote was this: Real art consists in producing with one's own hands those things of use or ornament, so made as to exactly suit the one they are made for. Thus study and practice can produce a hat which meets the highest requirements and at a very low cost, while a hat bought at a very high price from a millinery shop—a hat made for the general trade—can never express art so well.

Another thing which was manifest in both her lectures was that the little courtesies of life cultivate real kindness of heart and thoughtfulness for others.

State College

Appears Winner in Legislature.

One of the most significant developments in the legislature now in session at Olympia is the apparent defeat of the movement inaugurated by friends of the state university to transfer many of the courses now given at the state college at Pullman to the university at Seattle and at the same time add more than three quarters of a million dollars to the taxes levied to support these two institutions and the three normal school of the state.

A tremendous protest from all over the state is credited with having done much to defeat the proposed measures, which were fathered in the legislature by Representatives Victor Zednick of Seattle, a graduate of the university. Practically the entire state outside of King county, the home of Seattle, has spoken against the change which would have robbed the state college of much of its value and reduced it to a position of inferiority among the schools of the country. It seems practically certain now that the university propaganda will not succeed in any appreciable degree, and that the college at Pullman that has been doing a great work for the upbuilding of the life of the entire state, especially the farm life, will be permitted to continue to develop into an even greater field of usefulness.

Military Training.

The subject of military training has taken a prominent place in the consideration of the legislature. Conferences are being held with a view to determining the advisability of enacting a measure providing for military training in the high school. General Bell of the U. S. army recently addressed the legislature, and promised that if the state passed such law the government would provide an instructor in every high school having 100 or more able bodied students to take the military training required.

The proposal to add nearly a million dollars to the appropriation for the state militia department has aroused much opposition, and it appears probable that such appropriation will not be made, though only a concerted movement against it throughout the state is needed to insure its defeat.

The "bone dry" measure is still not acted upon, owing to differences of opinion both in the legislature and throughout the state. There are two factions at war over the measure: One wishes the measure passed and put into immediate effect; the other wishes it passed with a provision that before it goes into effect the people shall be allowed to vote upon it in 1918. There is practically no attempt to defeat the idea of prohibition itself.

Two Cougars Shot.

D. V. Dunham, a rancher living two miles from Cathlamet, shot a cougar the other day, the second within a week. The animals were a year old and each was five feet long. Mr. Dunham shot the first cougar as it was attempting to spring at him. He caught the last one in a trap and shot him. He will receive a bounty of $20 apiece.

GRASS

Billion Dollar Grass is a Salzer creation—grows 6 to 8 feet. The wonder crop for green feed, ensilage, hay and seed. Fine stooler. Salzer's Sudan Grass has produced 7 tons per acre. 2 to 3 cuttings per year. Salzer's Northern Grown, pedigreed clovers, grasses, and mixtures lead the world.

Let the Seeds Talk

Girls and boys—boys and girls—teachers and parents—one and all—we are downright happy to think of how busy you have kept us this past week sending out books for school libraries. To us each book we send to a school is a reward of merit most gladly given. Each book represents the ambitious work of some sturdy chap or bright-eyed little lady on the one hand and the kindly cooperation of fathers and mothers, uncles and aunts, grownup brothers and sisters, cousins, friends and acquaintances—all willing to help add to the supply of good reading in the schools—on the other hand.

Libraries and books to supplement libraries have gone out this week to the following schools:

Ruth E. Rollins, Upper Hunter Creek school, Hunters, Wash.; Lillian Westley, Excelsior school, Blaine, Wash.; A. A. Strickler, Great Northern school, Spokane, Wash.; Mrs. Ocie Howard, Coulee school, Reardan, Wash.; Florence Woodward, Deep Creek school, Espanola, Wash.; W. Ivan Montanye, North Basin school, Orin, Wash.; Miss Franc De Graff, Selah school, Selah, Wash., and Milo Ball, Marshall school, Marshall, Wash.

Upper Hunters Creek school, under the able management of Miss Ruth E. Rollins, and with as ambitious a band of workers as can be found in the whole northwest, secured a full library long before the holidays. But they didn't stop——oh no—not by any means. They liked their library so well that they determined to have more books. So these boys and girls kept their contest going and as you have noticed from the above list have secured still more books—which makes the Upper Hunters Creek school library the largest that we have so far awarded.

If you want to know how wide open are the eyes of the boys and girls of Border school at Otis Orchards, taught by Miss Constance Blackman, just listen to this. The other day an automobile passing along the road near the school came upon a sharp turn, a hill and a piece of very bad road all at the same place and same time. The machine was stalled, and try as he might the driver, who was alone, found it impossible to proceed. So the members of Border school came to the rescue. But these boys and girls were working hard for a school library and the predicament of the motorist suggested a good chance to profit from the help they were able to give. So they told the driver (who owned a farm in the neighborhood) that if he would help them in their school library work by subscribing for the Farmer they would help him out. The gentleman admired the business-like manner of the proposition so much that he at first refused to subscribe just to see what effect it would have on the children. They showed him they weren't going to take unfair advantages and helped him out anyway. But after he was once more ready to go they reminded him again that one good turn deserves another and told him how hard they were working for a school library. When that man drove away he had become a subscriber to the Farmer and Border school had won another credit toward that library they are determined to have. Such are the fruits of making the most of every opportunity that comes along.

The following schools swung into the library contest ranks during the past week:

Ahtanum school, Yakima, Wash., F. C. Barker, teacher; Artesia school, Yakima, Wash., R. L. Dailey, principal.

Honor Roll.

Selah school: Marguerite Wall, Hazel Taylor, May Greiner, George Cox, Perry Tripp, Dorothy Browne, Sidney Bernier, Elsie Johnson, Elizabeth Fogelquist, Laurel Miller, Lucile Howard, Victor Johnson.

Narcisse school: Willie Hall.

River school: Wayne Lewis, Howard Garber.

Bonser school: Lambert T. Goin, Marguerite Goin.

Lower Naches: Eva Barnet.

Fruit Growers
Will Meet at Tacoma Next Week

The seventh annual meeting of the Western Washington Horticultural association will be held at Tacoma Commercial club Thursday and Friday, February 8 and 9.

Thursday morning's program includes "Small Fruits and Vegetables" by Fred Burglehaus, Sumner; discussion led by C. W. Orton, Sumner.

Thursday afternoon: "Fruit Byproducts" by W. H. Paulhamus, president of the Puyallup-Sumner Fruit Growers' association; "Fruit Pests in Western Washington" by T. O. Morrison, horticulturist, state department of agriculture, Olympia; "Commercial Pear Culture" by Robest B. Miller, Startup; discussion led by A. S. Caton, Olympia; "Nut Culture" by A. A. Quarnberg, Vancouver.

Thursday evening: "Rose Culture" by Carl F. Morisse, Tacoma; "Native Ornamentals" by Stepheen J. Harmeling, Vashon.

Friday morning: "Cooperation in Potato Growing" by H. M. Brayton, Alderton; "Growing Healthy Potatoes" by Arthur Frank, plant pathologist, western Washington experiment station, Puyallup; "Grading and Marketing Potatoes" by A. H. McLean, Tacoma; "Phases of the School Problem in Agriculture and Horticulture" by Mrs. R. A. Small, county superintendent of schools, Everett.

Friday afternoon: "Greenhouse Culture" by Lewis Beall; Vashon; "Future of the Fruit Industry" by Professor W. S. Thornber, director of extension department, Washington State college, Pullman; "Planting and Care of the Young Orchard" by C. A. Cole, agriculturist, Pierce county, Tacoma.

Finest Harbor.

The finest harbor in the world is said to be that of Rio de Janeiro, Brazil.

Turn Your Ford* Into a Practical Truck—Like This

Here's the sensible, practical, money-making attachment that will turn your Ford or other light car quickly into a real farm truck—a utility truck that will earn its board and keep many times over every year.

You need a truck like this for general hauling, for bringing in your supplies, for all kinds of uses around the place. How else can you get such a truck at anything like so low a price, or one that will cost so little to operate.

If you can't use it all the time, take it out and make money with it, hauling for your neighbors.

"WESTERN" TRUCK ATTACHMENT

Only *$350.00

*For Ford or any other light car —Easy to attach.

Strongest, most satisfactory truck attachment on the market, costing approximately
3 CENTS A MILE
for Gasoline, Tires and Oil.

The best steel, the best bearings—the best of everything goes into the "Western." Strong and rugged, it will stand all sorts of hard usage without flinching. Extra strong Whitney chains; heavy axle, 1 7-8 by 2 1-4 inches; 2-inch Timkin roller bearings. The service brake furnishes a braking area of 158 square inches and is entirely removed from the Ford transmission. The "Western" is adaptable, easy to handle and is readily attached to your car. You are right close to the home office—that's another advantage.

Get ready for spring—speed up the farm work with a "Western." Make this the big year!

Send the attached coupon TODAY for our latest literature showing the "Western" in detail, and showing how it can save you money and make you money.

Raise Alfalfa Cooperatively

Dairymen in Western Part of the State Purchase Land on East Side to Raise Hay for Shipment to Dairies on Puget Sound.

Benton County, Wash.—A western Washington dairy association has purchased 385 acres near Richland, which will be irrigated and used to grow alfalfa hay for the dairy cattle on the West Side.

Klickitat County, Wash.—Success in storing corn without it spoiling is experienced when it is mixed with dry straw.

Hay Brings $12.

RICHLAND, Benton County, Wash., Jan. 16.—Hay at Richland is selling at $12 in the stack and many of the farmers will make a nice profit on it this year. Harry Van Horn has 200 tons, Patrick Costello over 75 tons and B. S. Wadsworth about 70 tons which they expect to dispose of this month. Many other farmers have from 10 to 40 tons for sale, as they can spare this amount and still have sufficient to carry their stock over. It is becoming more and more evident to the dairymen here that a great deal of hay is saved by cutting it up, as the cows then eat all the stems as well as leaves. Work will be started as soon as the weather permits on the largest individual body of dairy land in this part of the valley, when the 385 acres sold by the local irrigation company to a corporation of dairymen from the coast will be planted to alfalfa. A pump will be used to supply the necessary water for irrigation, and it is expected that this new and large acreage will be the means of interesting a great deal of outside capital in Richland. MRS. I. M. SAWYER.

Important to Organize.

TWISP, Okanogan County, Wash., Jan. 15.—A grange was organized at the Beaver Creek schoolhouse and will be known as the Beaver Creek Grange. Frank Thurlow is secretary. The Pipestone grange is the oldest farmers' organization in this neighborhood. C. L. Young is master at Pipestone. The farmers have a cooperative creamery at Twisp. E. F. McGee is manager and bookkeeper. Some of the farmers are beginning to feel the importance of being organized, while others want to be independent. GEORGE LA RUE.

Ship More Fruit.

OMAK, Okanogan County, Wash., Jan. 19.—There were about 200 more cars of fruit than last year shipped from Omak during the past season. We are having a mild winter and stock is coming through in good shape. Considerable building was done the past season. There will be an increased acreage of grain the coming season. There seems no reason why wheat should not come through all right. J. O. WOODS.

Stores Corn With Straw.

CENTERVILLE, Klickitat County, Wash., Jan. 23.—This community does not seem to be doing anything extra in the way of crops, as the land is practically all in cultivation that is farmable, but there is quite a little clearing of creek land to get it under cultivation for clover or other crops. The noticeable thing here at Goldendale is the organization of a farm loan association with a good membership. There is not much improvement by new buildings, as that is done mostly during the summer season. The corn crop, I should think, would be on the increase, as the fodder is coming in extra good use this winter, and it seems to me that we ought to still plant more, as there isn't any stock but helps to clean it up. Have had such good success with mixing it and straw together to keep the fodder from spoiling. The fall grain for the last three weeks has been without any protection. The crop prospect at present is maybe good and maybe not. It is very hard to tell at the present time. There seems to be a good supply of local alfalfa offered for sale here at present, with some of the sheep sold on the market it leaves an extra supply. D. A. LESTER.

Potato Acreage Increased.

PROSSER, Benton County, Wash., Jan. 22.—This community is not increasing in any one thing except potatoes, and some farmers are counting on planting a larger acreage this spring. Live stock men are selling off their young cattle and cows and keeping only the best grade. More silos are being built this year more than anything else here. I would like to see more corn planted as feed for the hogs. There was but little fall grain sown last fall, so wheat prospects will depend on the coming spring acreage.

G. W. WILGUS.

Stable Saddle Ponies.

LEAHY, Douglas County, Wash., Jan. 23.—There is no material change planned for this year's crop. Cattle and hogs are the most promising of live stock. All the live stock are going through the winter in fine shape. There has been fine weather, and so far plenty of feed. There is no direct to the consumer marketing in this locality, cattle and hogs are mostly sold to local buyers and then shipped. The improvements to our schoolhouse and grounds is a stable for scholars' horses, which was badly needed.

W. A. GRAY.

More Cooperation Needed.

GRANDVIEW, Yakima County, Wash., Jan. 18.—I think that there will be more corn than usual. I would like to see more cooperation for better marketing of farm products. There are a few new houses, two good ones. There was a few new silos last fall. There are a few small pieces of fall grain and they look very well. However, there is very little grain sown here, the farms being mostly all small orchards.

E. H. FAULKNER.

Land Clearing Noticeable.

SHELTON, Mason County, Wash., Jan. 16.—Perhaps the most noticeable improvement seen in Mason county is the clearing away of the forest by various logging enterprises, followed by the slow process of clearing away the stumps and undergrowth, and rendering the soil a farm producing factor. This is necessarily such a tremendous undertaking that the ordinary individual possessed of small capital can make but little showing of income or improvements in one year. Fall sown grain was slow in germinating. Much of it does not appear green. Though there has been unusual coldness this winter stock has done fairly well, but there will be a shortage of forage unless spring opens very early, still farmers are cheerful.

SCOTT HAYES.

Want Seed Potatoes.

KING HILL, Elmore County, Idaho, Jan. 10.—One carload of early potatoes was received by the King Hill farmers two weeks ago, and if the farmers get the seed there will be a bigger acreage in early potatoes this year. There was not much fall grain seeded but a little rye, which is doing well. Farmers are gradually getting more stock. Hogs have gradually lost their place. We would like to see the government take the ditch over and complete it, and settle the rest of the land. The spring seeding of grain will be about the same as last year.

WILLIAM A. DUNCAN.

Winter Wheat Safe.

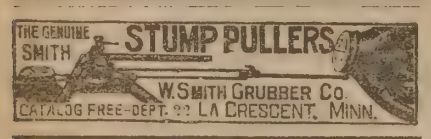
CAMBRIDGE, Washington County, Idaho, Jan. 14.—This community is now in the grasp of severe cold weather, with about 18 inches of snow, which assures the winter wheat against winter kill. Stock is doing well. There has been quite a noticeable increase in cattle, especially in dairy stock. The farmers in general are breeding higher grade stock than in the past. Hogs are not as plentiful on account of the high price of grain. There has been no boom in the way of building in this community. The North and South highway is occupying our attention now more than anything else. Washington county has already bonded to the amount of $100,000 for the construction of a highway through that county, and Adams county will take action in the near future on a bond of $80,000. We are very proud of the new court house in Adams county.

S. N. YORK.

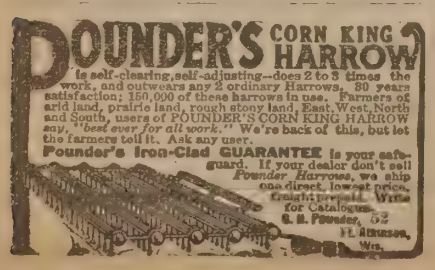
Union Saved $300.

SNOWBANK, Dawson County, Mont., Jan. 11.—Farmers are raising both spring and fall pigs, the spring pigs invariably doing the best. There is much pork dressed before selling, which does not pay well, aside from the home consumption of meats. We have a strong Farmers' Union here, having bought 54,000 feet of lumber, 25,000 pounds of flour, and 200 boxes of apples this season, which has resulted in savings close to $300.

NORMAN S. ROBERTSON.



Farmers Are Building.

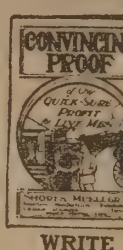


LEWISTOWN, Fergus County, Mont., Jan. 11.—Every farming industry, with the possible exception of sheep and hogs, is on the increase. With the high price of farm products received the last year the farmers are putting up considerable new buildings and modern equipment on the farm. The present prospects seem to indicate that the fall wheat is in good condition.

CARL H. PETERSON.

Cattle Increase.

AMERICAN FALLS, Rosebud County, Mont., Jan. 16.—We have more cattle now than we have ever had in previous years, but not so many hogs or sheep. Horses remain about the same. The farmers are putting up better buildings and some silos. We need good farmers in this community. Our county is short on fall grain, but the farmers expect to sow a large acreage of spring wheat. There will be more grain sown here next year than ever before, at least 40 per cent more. When it gets too late for other crops, then corn is planted and sometimes cultivated, and even then good crops are raised. T. E. HAMMOND.



Clean Up! Turn bush-land into cornfield, disk your roadsides and kill the chinchbugs. The Cutaway CLARK Bush and Bog Plow does away with the bushknife, grubhoe and shovel—it's better, quicker and cheaper. Logged-Off Land Train

Will Be Run to Demonstrate Clearing Methods

What promises to open up a field of extension work hitherto only incidentally touched, but with far-reaching possibilities, is announced in the running in April this year of a special Great Northern train carrying every known practical implement and article for clearing stump land and experts to handle them and deliver lectures on the methods of logged-off land development.

The train now announced likely will touch only western Montana, northern Idaho and eastern Washington, but if it accomplishes what it is expected to there is little doubt that other stump land sections will be given similar demonstration later.

Dates for Special Train.

The land-clearing special will stop at the following points along the Great Northern: Eureka, Mont., April 17; Libby, Mont., April 19; Bonners Ferry, Idaho, April 21; Sandpoint, April 23; Newport, Wash., April 25; Elk, Wash., April 27; Deer Park, April 29; Springdale, May 1; Cheewlah, May 3; Addy, May 5, and Colville, May 7.

At 7:30 a. m. on the date announced for each town the equipment will be unloaded from the land-clearing special and moved to the stump land selected for the demonstrations. The crew with each machine will be assigned a tract to clear and will put in the full day getting out the stumps. The powder crews will have a place of their own to work and will break up some of the stumps for the machines to pull out.

Practical Discussions.

The noon hour and evening will be given to conferences with the owners of cut-over land and discussion of the way to solve the problem of clearing land. The schedule allows one day between demonstrations, to assemble the equipment and move to the next town.

To equip the train for practical demonstration of clearing stump land there will be assembled in Spokane all kinds of machines now in use, with crews to operate them at the points visited by the special, and a powder crew to show the efficiency of explosives. It is planned to include all kinds of devices, from a lever to pry out the stumps to the big, powerful stump pullers, and to show the advantages of using explosives in connection with the machinery. There will be a one-man stump puller, several horsepower stump puller, a caterpillar engine, a tractor, machines for drilling and burning stumps, a home-made tripod stump puller, a stump-sawing machine and demonstrations of the efficiency of different grades of blasting powder. There will be from 20 to 25 men in the party, including the men who will operate the equipment at every demonstration.

Representatives of the agricultural colleges will give illustrated talks in regard to working the soil in the cut-over districts, what crops will be most satisfatcory and the favorable conditions for dairying and raising live stock. Printed bulletins will be distributed that deal with soils, crops and land clearing problems..

Promoters of Plan.

Detailed arrangements for the land-clearing demonstration were made at a conference attended by Fred W. Graham, western immigration and industrial agent of the Great Northern; Dr. Ira D. Cardiff, director of the experiment station at the Washington State college; Professor C. H. Shattuck of the University of Idaho, County Agricultural Agent J. R. Shinn and his assistant; W. W. Skuse of Spokane, E. F. C. Van Dissel of Spokane, and H. F. Samuels of Samuels, Idaho. The following Great Northern officials were also present: George S. Stewart, assistant general superintendent; F. J. Gavin, superintendent of the Spokane division.

The possibilities of development through land clearing are well known to those who have visited logged-off sections. The pictures herewith might be duplicated many times in the northwest states.

The logged-off land demonstration train will have as its purpose not only the inspiration of landowners, but their education in methods of clearing land and placing it in condition for cropping.

One expert says there are five distinct methods of removing stumps—(1) By burning in the ground, (2) by destroying by chemicals, (3) digging out by manual labor, (4) by blasting and then burning, and (5) by pulling.

Dairy Cow Has a Rival in Paris

Chinaman Operates Factory Producing "Milk" and Other Food Products From the Soya Bean

At last the dairy cow has a rival. In Paris they are marketing milk made from the soy or soya bean of China. A member of the family of the famous statesman Li Hung Chang, former Chinese minister to the United States, owns and operates the Paris factory, which not only produces soy milk, but many other food and industrial products from the same bean.

Astonishing claims are made of its almost universal usefulness. A British government report gives the following list of soya products:

"Vegetable food (like marrow fat peas), soups, meat substitute, chocolate substitute, macaroni preparation, flour, artificial milk, cheese, coffee substitute, artificial corn biscuit and food for diabetic patients, sauce, meal for cattle, oils, oil cake for fodder, fertilizer, bean cake."

The same report points out that the oil from the bean is used in the manufacture of dynamite and high explosives, soaps, linoleum, rubber substitute, margarine, paints, varnishes, toilet powder, waterproof cloth, paper umbrellas and lanterns, salad oil, lubricants, lamp oil, preservative for sardines, substitute for lard.

American interest in this remarkable bean will be stimulated by an official report just published from the United States consul at Changsha, China.

"Bean milk is made from the small yellow beans, the same variety from which the Chinese bean curd and chiang or soy are made," the consular report says. "The process appears to be a very simple one. The beans are soaked and then crushed between two stones. The crushed mass is allowed to run off into a tub and is then strained through cheesecloth and diluted with water. After boiling, it is again strained, and the white milk run off into bottles and sold.

"An analysis of the bean-curd milk shows that it has a specific gravity of 1.020 and a fat content of 3.125, contrasted with a specific gravity of 1.029 and a fat content of 3.9 for good average cow's milk in America.

"The factory referred to is a small one. The proprietors do all their work at night in order to have their milk fresh for delivery the following morning. The milk is ready and bottled by daylight.

"The room where the milk is made shows that no complicated machinery is necessary in the manufacture of the milk. At one end of the room were found two of the small stone mills in which the beans were ground. Large numbers of bottles were arranged on a rack near the wall, clean and ready to receive the morning's supply of milk. At the opposite end of the room there were three wooden vats built into a concrete foundation, which proved to be a furnace. The prepared product is poured into these vats and boiled, the furnace being supplied with fuel from a hole in the outside wall. On either side were two earthenware jars into which the boiled product is poured and from which it is allowed to run through stopcocks into the bottles.

"The manufacturers of this milk seem to be endeavoring to conduct their factory along hygienic lines. They invited inspection of their factory and expressed a desire to carry out the suggestions made by the inspecting physician. These suggestions related principally to the sterilization of the bottles before allowing the milk to run into them.

"To the eye the product looks exactly like unskimmed cow's milk. It has an odor of raw beans, and is said to be not unpleasant to the taste."

Although the Chinese have used the soya bean extensively for at least 2000 years the first important shipment to Europe was made in 1908 by a British firm. The Germans almost immediately began to experiment with it and five years later were using the major part of an importation, estimated at more than $200,000,000 a year.

Sweden uses large quantities of the bean cake as fol for milch cows; Denmark has a large pressiug factory at Copenhagen; France has a factory built in Paris by a Chinese firm, and South Africa has recently begun to grow the bean in competition to the Manchurian farmers. Germany in 1912 rescinded her former import duty and installed reduction plants for the far eastern vegetable product in all her oil mills, importing the beans directly from Vladivostok by the shipload.

Commercial Utilization.

During the last year notable progress has been made in bringing about the commercial utilization of soy bean seed for the manufacture of oil, meal and various more or less complex products, says Chief William A. Taylor of the United States bureau of plant industry in his annual report just submitted to Secretary Houston. The soy bean is well adapted to the whole cotton belt and indeed to the whole corn region. In the cotton belt it promises to be an important crop wherever the acreage of cotton has been reduced. The immature bean seeds make a very delicious vegetable and are canned with ease. Inasmuch as soy beans can be more cheaply produced than any other bean seed, it is believed that there is a large field for the canning of green soy beans. Efforts are now being made to induce canning factories to put the product on the market. In the growing of the soy bean and in manufacturing products therefrom the United States can compete successfully with the orient.

Many Varieties of the Soy Bean

The soy bean is especially adapted to the cotton belt and northward into the southern part of the corn belt, according to farmers' bulletin 372, United States department of agriculture. The early varieties mature in the northern part of the corn belt, but frequently do not make a sufficient yield to warrant growing them. Farther south, where the later and larger varieties can be grown, the yield is sufficient to make their extensive cultivation very profitable. Generally speaking, the soy bean requires about the same temperature as corn. It is, perhaps, even better adapted to a warm climate and does not do well in a cool climate.

According to a bulletin of the Ohio experiment station issued in 1912, it is declared that within the last 20 or 25 years the soy bean has gained considerable prominence in the agriculture of several states, notably Massachusetts and Kansas, into both of which states the seed was imported direct from Japan. The wide variation in different varieties as regards time of maturity, permit it to be grown pretty generally throughout the United States. Roughly speaking, the earliest varieties can be grown successfully as far north as corn. In Ohio the acreage at present is not large, but is rapidly increasing. The Ohio experiment station has been growing soy beans continuously in a small way since 1894.

Typical soy bean plant.

Sidelights

The peace-at-any-price advocate has solved an old, old problem: What will happen when an irresistible force encounters an immovable object? He recommends the application of the principle of arbitration to such cases.

On Grounds of Neglect.

Parson—Aren't you the same couple that I married last month?

Groom-elect—Yes—but Cally got a divorce for neglect because I forgot to kiss her while shaving.——Puck.

Father's Opinion.

"What is political economy, dad?"

"To to be perfectly candid, my son, I can't tell you. Sometimes I think there isn't any such thing."—Philadelphia Bulletin.

He Will.

Always live within your income,
For there's just this much about it—
If you do not live within it
You will some day live without it.
—Exchange.

Money No Object.

The judge was passing sentence on a very defiant-looking culprit.

"This is a sad case," his honor said. "You, who remained honest until you were 40, have tarnished your name and dishonored your family for the sake of three miserable dollars."

"Please be fair," said the prisoner. "Was it my fault there were so few?"

The Horrors of Law.

The man of great financial prominence had met with an accident.

"We'll have to probe," said the doctor.

Just at that moment the man recovered consciousness and exclaimed: "If it's a surgical operation, go ahead, but if it's another investigation, give me an anaesthetic."

Perhaps He Could.

Among the letters received by the editor of a "heart to heart" column in a certain paper was the following, writ-written by a young man:

"Please can you tell me why a girl always closes her eyes when a fellow kisses her?"

In a moment of fiendish frankness the man of the pen indited the following reply:

"Send me your photograph, and perhaps I can tell you."

By All Means, No.

The editor opened a letter and read:

"I am a widow, having lost three husbands. Another man proposed to me last night, however. Do you think I should accept him?"

The editor sighed wearily, dipped his pen into the ink and wrote: "No, indeed. If you have lost three already you are too careless to be intrusted with a fourth."

Community Development

Market and Transportation Facilities Count

It is useless to produce a crop for which there is no market or, even worse, no transportation facilities, says Professor Thornber, director of extension state college of Washington. Thus the market and transportation facilities have become possibly the most important factor in community development.

The value of the land is determined by the productivity of the soil and the marketing and transporting facilities. Most farm crops can not walk to market, but must be hauled. While a certain locality may have the most favorable conditions possible for the production of apples, wheat or corn, if transportation facilities are not good then it will be better to produce hogs, cattle, horses, or sheep, a crop that may be driven to market.

In the same way, even though a district may be adapted to the growing of perishable fruits and vegetables, if markets are not of easy access or close to the farm, the crops will be unprofitable. It would be much better to raise some crop that could be transported to market, but that would not deteriorate rapidly if not marketed promptly.

The market problem is a keen one and must be given consideration or failure is invited. It is not a problem for the farmer to solve alone, but it is one in which we are all interested

Seven factors of community development are:

1. Productivity of soil.
2. Market and transportation facilities.
3. Good roads and streets.
4. Good schools and churches.
5. An intelligent reading people.
6. Parks and recreation grounds.
7. Pleasant, comfortable homes.

BUCKSHOT SPRAY IS NEEDED

Something worse than the codling moth is reported from certain northwest orchard districts, especially that of southern Idaho. Game wardens rather than insecticide or fungicide boards are being called in to fight the pest, which is nothing other than willow grouse, called in some localities just plain prairie chicken. Deputy Game Warden Davie of Adams county, Idaho, declares that in that section these birds are a real pest, doing enormous damage to fruit trees through the destruction of fruit spurs, which make them a delightful food delicacy during the snowy days of winter. It is declared that there have been as many as 200 fruit spurs found in the crops of birds killed for examination. Some of these "exhibits" are to be sent to the federal authorities with a view to working out a scheme for the prevention of their depredations.

All the World's a Stage, and All the Men and Women Merely Players

Mentioned in the "Leak" Investigation

Distinguished statesmen and financiers involved by Thomas W. Lawson of Boston in the probe by the house rules committee of the alleged "leak" to Wall street in connection with the president's peace message. J. P. Morgan, H. P. Davison and Frank A. A. Vanderlip, leaders of American finance, were summoned to appear before the committee and testify. William G. McAdoo, secretary of the treasury; Joseph Tumulty, secretary to President Wilson, and Secretary of State Lansing, together with several prominent financiers, were directly named by Thomas W. Lawson in his testimony before the committee. They have entered denials of Lawson's charges.

Relish Dinner for a Dime

Richard E. Lyons, one of the members of the squad of 12 New York "rookie" policemen, who volunteered for the 25-cents-day dietary test, is shown consuming his first 10-cent dinner. Most of the "victims" of the dietary test appeared to relish their food and all said that they had quite sufficient to satisfy their appetites. The meal which Lyons is shown eating consisted of lamb stew with vegetables, stewed apricots, gingerbread and coffee. It is designed for the purpose of showing that men may remain well and strong on food not costing more than 25 cents a day.

Silent Sentinels at White House Gates.

(Photo by Clinedinst, Washington, D. C. From Underwood & Underwood, N. Y.

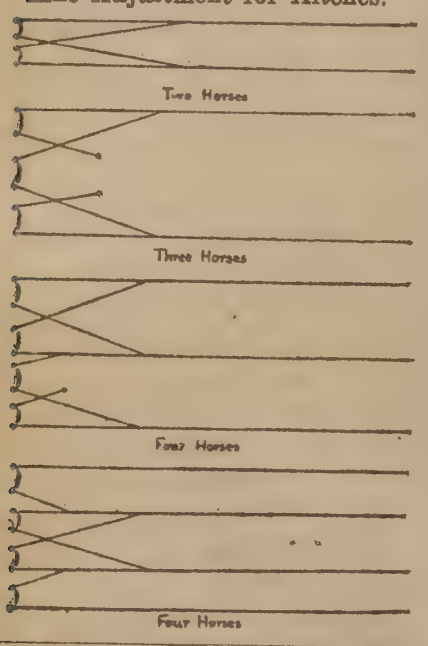
"Picketing the White House" is the latest activity of the members of the Congressional Union for Woman Suffrage in their strenuous efforts to force upon President Wilson and congress favorable consideration for the national woman suffrage amendment. It is now generally understood in suffrage circles as presaging the adoption of "military tactics" by the Congressional Union for Woman Suffrage.

Twice the president passed through one or the other of the gates in a motor car, but he merely smiled and said nothing, as he saw the silent sentinels and their banners. The women made no effort or attempt to obstruct his passage or to do anything more than display their big banners.

Freezing winds swept the White House grounds and forced the pickets to cling with both hands to the heavy tossing banners, while their lips turned blue and the tears came to their eyes with the cold. The custodian of the west entrance of the White House, acting upon orders from the president, came out and told the shivering women that they might come within the mansion and warm themselves whenever they wanted to, but requested them, when they did so, to leave their banners on the outside.

Hitching a Team

Well to Remember Safety First



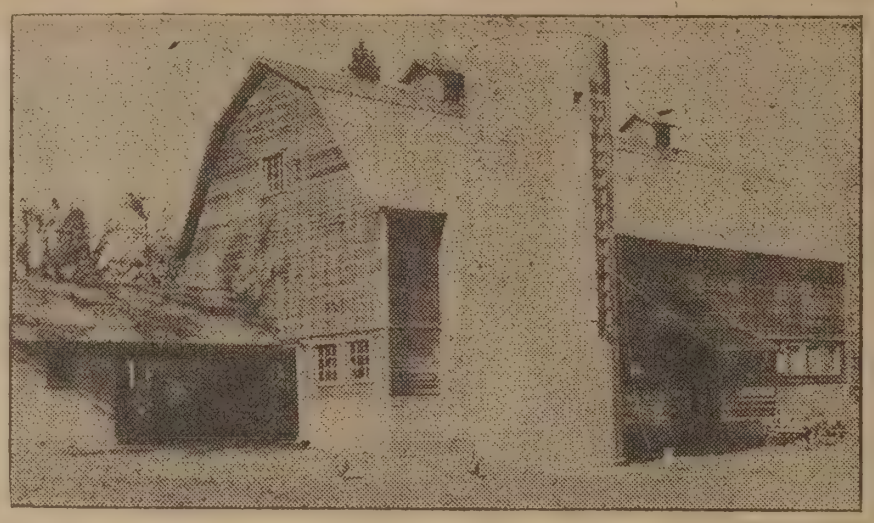
Safety, and speed with safety as the major point, is to be remembered in hitching a team, says a bulletin of the Washington State college. Many men report different methods in the hitching. A very good practice is a partial hitching of the team as the horses are led from the barn. When this is done, the horses are checked, the inside reins are then snapped to the bridles, thus coupling the horses. The outside rein of the off horse is then snapped and his rein undone. Then this line is carefully thrown across the back of the two horses. Next the outside rein of the near horse is snapped and his line unfastened. In coupling the horses be sure to put the coupling rein of the "freeest" horse above that of the other, and if one horse is higher headed, place his coupling rein above that of the other. This is done because there is no need of punishing the quiet horse, if the other is fiery or high headed. When the horses are coupled, they may have to be driven to the wagon. Put them in position for hitching by driving across the tongue from the side and rear. First fasten the neckyoke, slip the tongue into the neckyoke ring and then fasten the traces. The inside trace of the off horse may be fastened while working behind the near horse, and then fastening both traces of the near horse, and finally the outside trace of the off horse.

While fastening the traces, always have the lines drawn across the arm, as otherwise there is danger of the team becoming frightened and running away. These same rules may also be applied in unhitching the team.

The hitching of three or four horses abreast is similar except in the case of the lines. For the three-horse hitch, the three-horse evener should be used in all cases. The outside lines should be run from the two outside horses. The coupling lines should be attached to the middle horse and the outside horses should be "tied in" to the hames of inside horse. The length of the coupling reins and the tie reins is governed similarly to the length of the coupling reins discussed in a preceding paragraph.

In hitching four horses abreast, certain conditions control the use of the four-horse doubletree or the four-horse chain evener. Where the chain evener is used, three lines are all that are needed. In this case the "tongue"

Line Adjustment for Hitches.



horses are hitched to one side or the other, depending on conditions. The outside horse or fourth horse is controlled by a third rein, the coupling rein being attached to the third horse.

In case the four-horse doubletree is used, the "tongue" horses are the middle pair. These are hitched as any team, and then a jerk rein is placed upon each outside horse. These outside horses are tied in to the middle pair. In this case the main lines and tie reins are adjusted as needs be, and the outside lines are used simply as jerk reins, so do not need any adjusting.

Barn Built to Save Labor

Feed Usually Chopped While the Separator is Running

New labor-saving dairy barn of W. O. Morrow, Independence, Ore.

The dairy barn shown above, recently completed by W. O. Morrow on his farm near Independence, Ore., was built primarily with the idea of saving labor, and it seems that the desire was well accomplished. The barn is 38 x80 feet high to the caves. It is well built, has concrete foundations and floors and the walls for four feet are of the same material. The floors of the stalls have planking above the concrete. There are 20 stanchions on one side and 10 box stalls on the other. Thirty-six-inch square windows, set close together, admit plenty of light. The home made swinging iron stanchions are carried on a long bar that slides, so all the stanchions can be closed or opened at once. Gas pipe, bent while cold, embedded and anchored in the cement of the floor and fastened to an upright iron bar, forms the division between the stalls. A gutter of ordinary width runs behind the stanchion stalls and a narrow drain next to the box stalls, all draining into a tank a short distance from the barn. Mr. Morrows plans for this liquid to form an important part of his manure.

The gate to each box stall is hung on a track that runs the entire length of the stalls. They are tight and easily run and do not get in the way like a gate swung on hinges. Five hay chutes each serve two box stalls, so there is no second handling of the hay and on the other side there are two hay chutes, so hay does not have to be carried more than 20 feet in either direction.

In the loft are bins for over 2000 bushels of grain. An ordinary elevator is used for elevating the grain and no other handling is required. The grain is drawn by gravity down either of two chutes to the chopper in the barn, and elevated again to the chop bin, from which it can be drawn out as wanted and comes down another chute ready to feed.

The silo is at one side near the end. It was this year filled with good corn that was put in before the early frost. The separator room is near the end of the barn and feed is usually chopped while the separator is running, to save time and fuel. The manure spreader can be driven through the barn and most of the manure is thus taken directly to the fields. H. A.

Peculiar Tree.

In Mexico there grows a tree called the "tree of little hands." It is thus called owing to the fact that its five peculiarly curved antlers look like the fingers of a child.

Write to the Editor

The Washington Farmer will be glad to get a letter from any subscriber at any time.

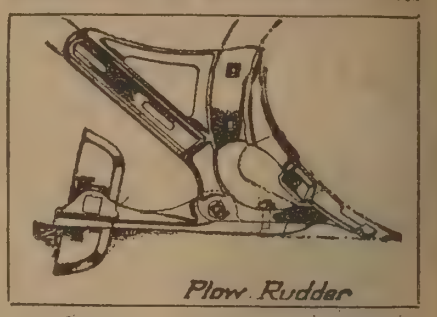
If we are making a paper that you like, tell us so. If we are making a paper in any respect that you do not like, it is yet more important that you should tell us so.

Having thousands and thousands of subscribers, of course it is out of the question to make the paper just as each subscriber would like to have it in every particular. Folks are different and like different things in their reading. This makes it interesting. We try to have something of special interest to every subscriber before we get through with it. Sometimes it takes longer, sometimes shorter to get around to the particular thing you like. It may happen that many readers enjoy one kind of reading matter and only a few another kind, so we can not be expected to give as much space to the desires of the few as to the desires of the many.

You see that it is no simple problem to get up a farm paper for a large number of people.

Then write us about any question that interests you, or any question that troubles you. We may be able to help you. Remember, that the chief difficulty in answering any question is in having the question itself plainly and correctly stated. For instance, a general question regarding the law of boundary fences can be answered easily, while the question regarding your own line fence when there is a dispute between you and your adjoining neighbor may be so intricate and have so many things connected with it which only a trained attorney could answer, after a personal interview with you.

Write us any inquiry you desire to make and we will be glad to give you the best answer possible, whether it is a simple matter of statistics or a matter requiring the advice of experts.

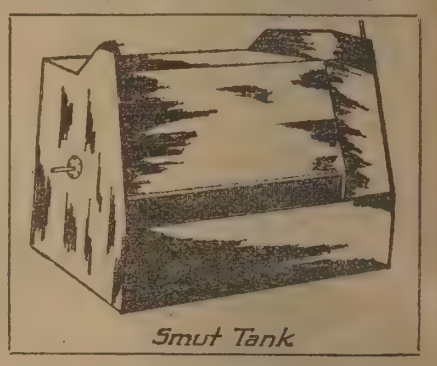


We want your letter, for that is the only practicable way we can talk with most of our readers. Write us anything and everything you wish, and be sure that you will get a reply containing all the information that we have at hand or that we can obtain from people who do know with respect to the particular thing about which you want information.

Inventions

By C. J. LYNDE, Macdonald College, Quebec.

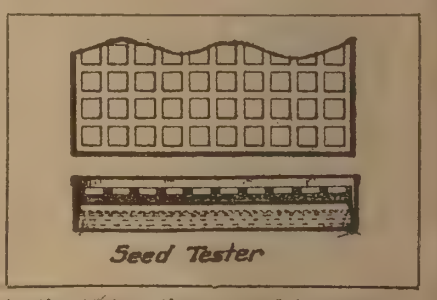
Plow Rudder.



The rudder shown here is a thin metal bar which is attached to the under face of the standard, and resists

any lateral motion. It is designed particularly for cotton plows and middle buster plows.

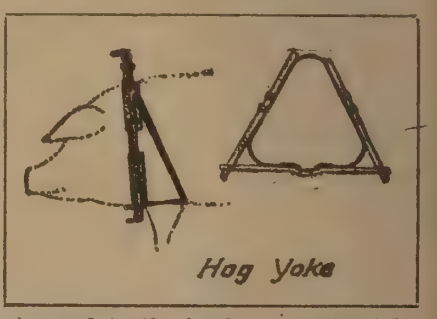
Machine for Treating Grain.



A solution of formaldehyde, or other disinfectant, is used to destroy the germs of smut and rust on seed grain. In this tank the solution in the inner chamber passes through the sieve, and

wets the grain in the outer chamber. When the tank is inverted the solution returns to the inner chamber and the treated grain is discharged into a suitable receptacle. The operation is then repeated with a fresh batch of grain.

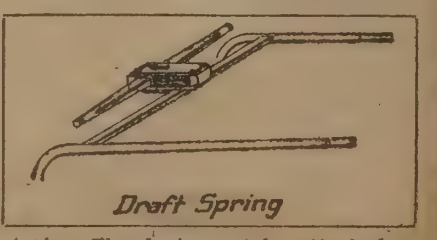
Seed Tester.



The new feature of this tester is the square absorbent pad which has 100 small depressions. It is moistened and placed on a support above the water

in the tester; then a seed is placed in each depression and the tester is covered. The number of seeds which sprout, out of the 100 tested, gives at once the per cent quality of the seed.

Neck Yoke.



The tubular metal bars of this yoke are fastened to one another by cotter

pins and to the leather neck band by U shaped metal straps. The yoke is secured to the hog by means of ropes.

Cushion for Swingletrees.

The spring of this device relieves the shoulders of the horse from shocks and

strains. The device can be attached to any pair of shafts.

WHEN KNIGHTHOOD WAS IN FLOWER

or, the Love Story of Charles Brandon and Mary Tudor, the King's Sister, and Happening in the Reign of His August Majesty, King Henry the Eighth.

By EDWIN CASKODEN (Charles Major).

Copyright, 1898, The Bobbs-Merrill Co.

SYNOPSIS.

Charles Brandon, who has neither wealth nor title, wins distinction for having defeated the heretofore unconquerable duelist, Judson. Brandon is installed as one of the captains of the guard of King Henry VIII. Edwin Caskoden (who tells the story) is Master of the Dance at London Court. The two young men become fast friends. Edwin tells Brandon of the willful, but adorable Mary Tudor, who had coaxed her royal brother Henry out of many proposed marriages which had been arranged for Henry's advantage. Edwin confesses that he, like scores of other men, had fallen in love with Mary, but upon Mary's refusal to marry him, he immediately became attracted to the good and beautiful Lady Jane Bolingbroke. He predicts that Brandon will soon fall a victim to Mary's charms.

At their first meeting, Mary and Brandon have a tilt, in which Mary comes off second best and acknowledges it. Wondering as to Brandon's social accomplishments, and to settle a wager with Sir Edwin that he could not dance, Mary invites Brandon, Edwin and Jane to her drawing room. To her surprise and Edwin's delight Brandon is perfectly at east and proves that he knows more about dancing than the Master of the Dance, himself. He offers to teach the Princess Mary one of the new French dances.

CHAPTER IV.—(Continued.)

The princess stood irresolute for a moment in evident hesitation and annoyance.

"You are grieving because I think you bold! And yet you stand there laughing at me to my face. I think so more than ever now. I know it. Oh, you make me angry! Don't! I do not like persons who anger me and then laugh at me." This turned Brandon's smile into a laugh which he could not hold back.

Mary's eyes shot fire, and she stamped her foot, exclaiming: "Sir, this goes beyond all bounds; I will not tolerate your boldness another moment." I thought she was going to dismiss him, but she did not. The time had come when he or she must be the master.

It was a battle royal between the forces on the floor, and I enjoyed it and felt that Brandon would come out all right.

He said good-humoredly: "What, shall you have all the laugh in your sleeve at my expense? Do you expect to bring me here to win a wager for you, made on the assumption of my stupidity and lack of social accomplishments, and then complain when it comes my turn to laugh? I think I am the one who should be offended, but you see I am not."

"Caskoden, did you tell him?" demanded Mary, evidently referring to the wager.

"He said not a word of it," broke in Brandon, answering for me; "I should have been a dullard, indeed, not to have seen it myself after what you said about the loss of your ten crowns, so let us cry quits and begin again."

Mary reluctantly struck her flag.

"Very well, I am willing," she said laughingly; "but as to your boldness, I still insist upon that; I forgive you, however, this time." Then, half apologetically, "After all, it is not such a grievous charge to make. I believe it never yet injured any man with a woman; they rather like it, I am afraid, however angry it makes them. Don't they, Jane?"

Jane, of course, "did not know," so we all laughed, as usual, upon the slightest pretext, and Mary, that fair bundle of contradictions and quick transitions, stepped boldly up to Brandon, with her colors flying in her cheeks, ready for the first lesson in the new dance.

She was a little frightened at his arm around her waist, for the embrace was new to her—the first touch of man—and was shy and coy, though willing, being determined to learn the dance. She was an apt pupil and soon glided softly and gracefully around the room with unfeigned delight; yielding to the new situation more easily as she became accustomed to it.

This dance was livelier exercise than La Galliard, and Mary could not talk much for lack of breath. Brandon kept the conversation going though, and she answered with glances, smiles, nods and monosyllables—a very good vocabulary in its way, and a very good way too, for that matter.

Once he said something to her, in a low voice, which brought a flush to her cheeks and caused her to glance quickly up into his face. By the time her answer came they were nearer us, and I heard her say: "I am afraid I shall have to forgive you again if you are not careful. Let me see an exhibition of that modesty you so much boast." But a smile and flash of the eyes went with the words, and took all the sting out of them.

After a time the dancers stopped, and Mary, with flushed face and sparkling eyes, sank into a chair, exclaiming: "The new dance is delightful, Jane. It is like flying; your partner helps you so. But what would the king say? And the queen? She would simply swoon with horror. It is delightful though." Then, with more confusion in her manner than I had ever before seen: "That is, it is delightful if one chooses her partner."

This only made matters worse, and gave Brandon an opportunity.

"Dare I hope?"—he asked, with a deferential bow.

"Oh, yes; you may hope. I tell you frankly it was delightful with you. Now, are you satisfied, my modest one? Jane, I see we have a forward body here; no telling what he will be at next," said Mary, with evident impatience, rapidly swaying her fan. She spoke almost sharply, for Brandon's attitude was more that of an equal than she was accustomed to, and her royal dignity, which was the artificial part of her, rebelled against it now and then in spite of her real inclinations. The habit of receiving only adulation, and living on a pinnacle above everybody else, was so strong from continued practice that it appealed to her as a duty to maintain that elevation. She had never before been called upon to exert herself in that direction, and the situation was new. The servile ones with whom she usually associated maintained it for her; so she now felt, whenever she thought of it, that she was in duty bound to clamber back, at least part of the way, to her dignity, however pleasant it was, personally, down below in the denser atmosphere of informality.

In her heart the princess preferred upon proper occasions, such as this, to abate her dignity, and often requested others to dispense with ceremony, as, in fact, she had done with us earlier in the evening. But Brandon's easy manner, although perfectly respectful and elegantly polite, was very different from anything she had ever known. She enjoyed it, but every now and then the sense of her importance and dignity—for you must remember she was the first princess of the blood royal—would supersede even her love of enjoyment, and the girl went down and the princess came up. Besides, she half feared that Brandon was amusing himself at her expense, and that, in fact, this was a new sort of masculine worm. Really, she sometimes doubted if it were a worm at all, and did not know what to expect, nor what she ought to do.

She was far more girl than princess, and would have preferred to remain merely girl and let events take the course they were going, for she liked it. But there was the other part of her which was princess, and which kept saying: "Remember who you are," so she was plainly at a loss between natural and artificial inclinations contending unconsciously within her.

Replying to Mary's remark over Jane's shoulder, Brandon said:

"Your highness asked us to lay aside ceremony for the evening, and if I have offended I can but make for my excuse my desire to please you. Be sure I shall offend no more." This was said so seriously that his meaning could not be misunderstood. He did not care whether he pleased so capricious a person or not.

Mary made no reply, and it looked as if Brandon had the worst of it.

We sat a few minutes talking, Mary wearing an air of dignity. Cards were proposed, and as the game progressed she gradually unbent again and became as affable and familiar as earlier in the evening. Brandon, however, was frozen. He was polite, dignified and deferential to the ladies, but the spirit of the evening was gone, since he had furnished it all with his free, off-hand manner, full of life and brightness.

After a short time, Mary's warming mood failing to thaw our frozen funmaker, and in her heart infinitely preferring pleasure to dignity, she said: "Oh, this is wearisome. Your game is far less entertaining than your new dance. Do something to make me laugh, Master Brandon."

"I fear you must call in Will Sommers," he replied, "if you wish to laugh. I can not please you in both ways, so will hold to the one which seems to suit the princess.

Mary's eyes flashed and she said ironically:

"That sounds very much as though you cared to please me in any way." Her lips parted and she evidently had something unkind ready to say; but she held the breath she had taken to speak it with, and, after one or two false starts in as many different lines, continued: "But perhaps I deserve it. I ask you to forgive me and hereafter desire you three, upon all proper occasions, when we are by ourselves, to treat me as one of you—as a woman—a girl, I mean. Where is the virtue of royalty if it only means being put upon a pinnacle above all the real pleasures of life, like foolish old Stylites on his column? The queen is always preaching to me about the strict maintenance of my 'dignity royal,' as she calls it, and perhaps she is right; but out upon 'dignity royal' say I; it is a terrible nuisance. Oh, you don't know how difficult it is to be a princess and not a fool. There!" And she sighed in apparent relief.

Then turning to Brandon, "You have taught me another good lesson, sir, and from this hour you are my friend, if you will be, so long as you are worthy—no, I do not mean that; I know you will always be worthy—but forever. Now we are at rights again. Let us try to remain so—that is, I will," and she laughingly gave him her hand, which he, rising to his feet, bowed low over and kissed, rather fervently and lingeringly, I thought.

Hand-kissing was new to us in England, excepting in case of the king and queen at public homage. It was a little startling to Mary, though she permitted him to hold her hand much longer than there was any sort of need—a fact she recognized, as I could easily see from her tell-tale cheeks, which were rosy with the thought of it.

So it is when a woman goes on the defensive prematurely and without cause; it makes it harder to apply the check when the real need comes.

After a little card-playing I expressed regret to Jane that I could not have a dance with her for lack of music.

"I will play, if the ladies permit," said Brandon; and he took Lady Jane's lute and played and sang some very pretty little love songs and some comic ones, too, in a style not often heard in England, so far away from the home of the troubadour and lute. He was full of surprises, this splendid fellow, with his accomplishments and graces.

When we had danced as long as we wished—that is, as Jane wished—as for myself, I would have been dancing yet—Mary again asked us to be seated. Jane having rested, Brandon offered to teach her the new dance, saying he could whistle an air well enough to give her the step. I at once grew uneasy with jealous suspense, for I did not wish Brandon to dance in that fashion with Jane, but to my great relief she replied:

"No; thank you; not tonight." Then shyly glancing toward me: "Perhaps Sir Edwin will teach me when he learns. It is his business, you know."

Would I? If a month, night and day, would conquer it, the new dance was as good as done for already. That was the first real mark of favor I ever had from Jane.

We now had some songs from Mary and Jane; then I gave one, and Brandon sang again at Mary's request. We had duets and quartets and solos, and the songs were all sweet, for they came from the heart of youth, and went to the soul of youth, rich in its God-given fresh delight in everything. Then we talked, and Mary, and Jane, too, with a sly, shy, soft little word now and then, drew Brandon out to tell of his travels and adventures. He was a pleasing talker, and had a smooth, easy flow of words, speaking always in a low, clear voice and with perfect composure. He had a way of looking first one auditor and then another straight in the eyes with a magnetic effect that gave to everything he said an added interest. Although at that time less that 25 years old, he was really a learned man, having studied at Barcelona, Salamanca and Paris. While there had been no system in his education, his mind was a sort of knowledge junk-shop, wherein he could find almost anything he wanted. He spoke German, French and Spanish, and seemed to know the literature of all these languages.

He told us he had left home at the early age of 16 as his uncle's esquire and had fought in France, then down in Holland with the Dutch; had been captured by the Spanish and had joined the Spanish army, as it mattered not where he fought, so that there was a chance for honorable achievement and a fair ransom now and then. He told

Ready for the first lesson in the new dance.

When Knighthood Was in Flower

BY EDWIN CASKODEN

(Continued from preceding page.)

us how he had gone to Barcelona and Salamanca, where he had studied, and thence to Granada, among the Moors; of his fighting against the pirates of Barbary, his capture by them, his slavery and adventurous escape, and his regret that now drowsy peace kept him mewed up in a palace.

"It is true," he said, "there is a prospect of trouble with Scotland, but I would rather fight a pack of howling, starving wolves than the Scotch; they fight like very devils, which, of course, is well, but you have nothing after you have beaten them, not even a good whole wolf skin."

In an unfortunate moment Mary said: "Oh! Master Brandon, tell us of your duel with Judson."

Thoughful, considerate Jane frowned at the princess in surprise, and put her finger on her lips.

"Your ladyship, I fear I can not," he answered, and left his seat, going over to the window, where he stood, with his back toward us, looking out into the darkness. Mary saw what she had done, and her eyes grew moist, for, with all her faults, she had a warm, tender heart and a quick, responsive sympathy. After a few seconds of painful silence she went softly over to the window where Brandon stood.

"Sir, forgive me," seh said, putting her hand prettily upon his arm. "I should have known. Believe me, I would not have hurt you intentionally."

"Ah! my lady, the word was thoughtlessly spoken, and needs no forgiveness; but your heart shows itself in the asking, and I thank you; I wanted but a moment to throw off the thought of that terrible day." Then they came back together, and the princess, who had tact enough when she cared to use it, soon put matters right again.

I started to tell one of my best stories in order to cheer Brandon, but in the midst of it Mary, who I had noticed was restless and uneasy, full of blushes and hesitancy, and with a manner as new to her as the dawn of the first day was to the awakening world, abruptly asked Brandon to dance with her again. She had risen and was standing by her chair, ready to be led out.

"Gladly," answered Brandon as he sprung to her side and took her hand. "Which shall it be La Galliard or the new dance?" And Mary standing there, the picture of waiting, willing modesty, lifted her free hand to his shoulder, tried to raise her eyes to his, but failed, and softly said: "The new dance."

This time the dancing was more soberly done, and when Mary stopped it was with serious, thoughtful eyes, for she had felt the tingling of a new strange force in Brandon's touch. A man, not a worm, but a real man, with all the irresistible infinite attractions that a man may have for a woman—the subtle drawing of the lodestone or the passive iron—had come into her life. Doubly sweet it was to her intense, young virgin soul in that it first revealed the dawning of that two-edged bliss which makes a heaven or a hell of earth—of earth, which owes its very existence to love.

I do not mean that Mary was in love, but that she had met, and, for the first time felt the touch, yes, even the subtle, unconscious, dominating force so sweet to woman, of the man she could love, and had known the rarest of all God's perfect handiwork—a woman's heart—the throb that goes before—the John, the Baptist, as it were, of coming love.

It being after midnight Mary filled two cups of wine, from each of which she took a sip, and handed them to Brandon and me. She then paid me the 10 crowns, very soberly thanked us and said we were at liberty to go.

The only words Brandon ever spoke concerning that evening were just as we retired:

"Jesu! she is perfect. But you were wrong, Caskoden. I can still thank God I am not in love with her. I would fall upon my sword if I were."

I was upon the point of telling him she had never treated any other man as she had treated him, but I thought best to leave it unsaid. Trouble was apt to come of its own accord soon enough.

In truth I may as well tell you that when the princess asked me to bring Brandon to her that she might have a little sport at his expense she looked for a laugh, but found a sigh.

CHAPTER V.

A day or two after this, Brandon was commanded to an audience, and presented to the king and queen. He was now eligible to all palace entertainments, and would probably have many invitations, being a favorite with both their majesties. As to his standing with Mary, who was really the most important figure, socially, about the court, I could not exactly say. She was such a mixture of contradictory impulses and rapid transitions, and was so full of whims and caprice, the inevitable outgrowth of her blood, her rank and the adulation amid which she had always lived, that I could not predict for a day ahead her attitude toward any one. She had never shown so great favor to any man as to Brandon, but just how much of her condescension was a mere whim, growing out of the impulse of the moment, and subject to reaction, I could not tell. I believed, however, that Brandon stood upon a firmer foundation with this changing, shifting, quicksand of a girl than with either of their majesties.

In fact I thought he rested upon her heart itself. But to guess correctly what a girl of that sort will do, or think, or feel would require inspiration.

Of course most of the entertainments given by the king and queen included as guests nearly all the court, but Mary often had little fetes and dancing parties which were smaller, more select and informal. These parties were really with the consent and encouragement of the king, to avoid the responsibility of not inviting everybody. The larger affairs were very dull and smaller ones might give offense to those who were left out. The latter, therefore, were turned over to Mary, who cared very little who was offended or who was not, and invitations to them were highly valued.

In truth, I may as well tell you, that when the princess asked me to bring Brandon to her that she might have a little sport at his expense, she looked for a laugh, but found a sigh.

One afternoon, a day or two after Brandon's presentation, a message arrived from Mary, notifying me that she would have a little fete that evening in one of the smaller halls and directing me to be there as master of the dance. Accompanying the message was a note from no less a person than the princess herself, inviting Brandon.

This was an honor indeed—an autograph invitation from the hand of Mary! But the masterful rascal did not seem to consider it anything unusual, and when I handed him the note upon his return from the hunt, he simply read it carelessly over once, tore it in pieces and tossed it away. I believe the duke of Buckingham would have given 10,000 crowns to receive such a note, and would doubtless have show it to half the court in triumphant confidence before the middle of the night. To this great captian of the guard it was but a scrap of paper. He was glad to have it nevertheless, and, with all his self-restraint and stoicism, could not conceal his pleasure.

"My lord has dropped his sword."

Brandon at once accepted the invitation in a personal note to the princess. The boldness of this actually took my breath, and it seems at first to have startled Mary a little, also. As you must know by this time, her "dignity royal" was subject to alarms, and quite her most troublesome attribute—very apt to receive damage in her relations with Brandon.

Mary did not destroy Brandon's note, despite the fact that her sense of dignity had been disturbed by it, but after she had read it slipped off into her private room, read it again and put it on her escritoire. Soon she picked it up, re-read it, and, after a little hesitation, put it in her pocket. It remained in the pocket a moment or two, when out it came for another perusal, and then she unfastened her bodice and put it in her bosom. Mary had been so intent upon what she was doing that she had not seen Jane, who was sitting quietly in the window, and, when she turned and saw her, she was so angry she snatched the note from her bosom and threw it upon the floor, stamping her foot in embarrassment and rage.

"How dare you watch me, hussy?" she cried. "You lurk around as still as the grave, and I have to look into every nook and corner, wherever I go, or have you spying on me."

"I did not spy upon you, Lady Mary," said Jane quietly.

"Don't answer me; I know you did. I want you to be less silent after this. Do you hear? Cough, or sing, or stumble; do something, anything, that I may hear you."

Jane rose, picked up the note and offered it to her mistress, who snatched it with one hand, while she gave her a sharp slap with the other. Jane ran out, and Mary, full of anger and shame, slammed the door and locked it. The note, being the cause of all the trouble, she threw it to the floor again and went over to the window bench, where she threw herself down to pout. In the course of five minutes she turned her head for one fleeting instant and looked at the note, and then, after a little hesitation, stole over to where she had thrown it and picked it up. Going back to the light at the window, she held it in her hand a moment and then read it once, twice, thrice. The third time brought the smile, and the note nestled in the bosom again.

Jane did not come off so well, for her mistress did not speak to her until she called her in that evening to make her toilet. By that time Mary had forgotten about the note in her bosom; so when Jane began to array her for the dance it fell to the floor, whereupon both girls broke into a laugh and Jane kissed Mary's bare shoulder, and Mary kissed the top of Jane's head, and they were friends again.

So Brandon accepted Mary's invitation and went to Mary's dance, but his going made for him an enemy of the most powerful nobleman in the realm, and this was the way of it:

These parties of Mary's had been going on once or twice a week during the entire winter and spring, and usually included the same persons. It was a sort of coterie, whose members were more or less congenial, and most of them very jealous of interlopers. Strange as it may seem, uninvited persons often attempted to force themselves in, and all sorts of schemes and maneuvers were adopted to gain admission. To prevent this, two guardsmen with halberds were stationed at the door. Modesty, I might say, neither thrives nor is useful at court.

When Brandon presented himself at the door his entrance was barred, but he quickly pushed aside the halberds and entered. The duke of Buckingham, a proud, self-important individual, was standing near the door and saw it all. Now Buckingham was one of those unfortunate persons who never lose an opportunity to make a mistake, and being anxious to display his zeal on behalf of the princess stepped up to prevent Brandon's entrance.

"Sir, you will have to move out of this," he said pompously. "You are not at a jousting bout. You have made a mistake and have come to the wrong place."

"My lord of Buckingham is pleased to make rather more of an ass of himself than usual this evening," replied Brandon with a smile, as he started across the room to Mary, whose eye he had caught. She had seen and heard it all, but in place of coming to his relief stood there laughing to herself. At this Buckingham grew furious and ran around ahead of Brandon, valiantly drawing his sword.

"Now, by heaven! fellow, make but another step and I will run you through," he said.

I saw it all, but could hardly realize what was going on, it came so quickly and was over so soon. Like a flash Brandon's sword was out of its sheath, and Buckingham's blade was flying toward the ceiling. Brandon's sword was sheathed again so quickly that one could hardly believe it had been out at all, and, picking up Buckingham's, he said with a half-smothered laugh:

"My lord has dropped his sword." He then broke its point with his heel against the hard floor, saying: "I will dull the point, lest my lord, being unaccustomed to its use, wound himself." This brought peals of laughter from everybody, including the king. Mary laughed also, but as Brandon was handing Buckingham his blade, came up and demanded:

"My lord, is this the way you take it upon yourself to receive my guests? Who appointed you, let me ask, to guard my door? We shall have to omit your name from our next list, unless you take a few lessons in good manners." This was striking him hard, and the quality of the man will at once appear plain to you when I say that he had often received worse treatment, but clung to the girl's skirt all the more tenaciously. Turning to Brandon the princess said:

"How dare you watch me, hussy?"

"Master Brandon, I am right glad to see you, and regret exceedingly that our friend of Buckingham should so thirst for your blood." She then led him to the king and queen, to whom he made his bow, and the pair continued their walk about the room. Mary again alluded to the skirmish at the door, and said laughingly:

"I would have come to your help, but I knew you were amply able to take care of yourself. I was sure you would worst the duke in some way. It was better than a mummery, and I was glad to see it. I do not like him."

The king did not open these private balls, as he was supposed, at least, not to be their patron, and the queen, who was considerably older than Henry, was averse to such things. So the princess opened her own balls, dancing for a few minutes with the floor entirely to herself and partner. It was the honor of the evening to open the ball with her, and quite curious to see how men put themselves in her way and stood so as to be easily observed and perchance chosen. Brandon, after leaving Mary, had drifted into a corner of the room back of a group of people, and was talking to Wolsey—who was always very friendly to him—and to Master Cavendish, a quaint, quiet, easy little man, full of learning and kindness, and a warm friend of the Princess Mary.

It was time to open the ball, and, from my place in the musicians' gallery, I could see Mary moving about among the guests, evidently looking for a partner, while the men resorted to some very transparent and amusing expedients to attract her attention. The princess, however, took none of the bidders, and soon, I noticed, she espied Brandon standing in the corner with his back toward her. Something told me she was going to ask him to open the dance, and I regretted it, because I knew it would set every nobleman in the house against him, they being very jealous of the "low-born favorites," as they called the untitled friends of royalty. Sure enough, I was right. Mary at once began to make her way over to the corner, and I heard her say: "Master Brandon, will you dance with me?"

(To be continued in next issue.)

$275 WAITING TO BE WON

Being an Exhortation to Old and New Subscribers to Get Busy

By the Contest Editor

Only a few weeks remain of the big figure contest in which this paper is giving away $750 in 32 prizes, the largest to be $275 if the winner has paid $1.50 for three years' subscription to the Farmer.

The advantage of beginning your count now is that should you find your first solution to be wrong, you will have time to send in a corrected solution to the Contest Editor with another subscription payment as provided by the rules. A solution when once entered can not be changed.

Get into the contest now. Don't wait until the close when accuracy may have to be sacrificed to speed on account of lack of time.

Something to Know

This contest is given solely by the Northwest Pacific Farm Trio, which includes The Washington Farmer, The Idaho Farmer and The Oregon Farmer, and must not be confused with the subscription offers of any other newspapers or farm journals. Also remember that this is not a guessing contest.

To enter the Figure Contest it is necessary that you remit a new or renewal of subscription to the Farmer at the regular rate of $1 for one year or $1.50 for three years.

If you are already paid ahead on your subscription to the Farmer, your further subscription payments will be credited on an extension from the time to which you are now paid.

Answers to Mail

S. O. S.—Noah (surname not known) was the first man to combat leaks, and not Tom Lawson as you assert. There can be no leak in the Figure Contest because even the Contest Editor, who is the only person to know the correct solution, has locked the answer in a safety deposit vault and forgotten the exact figures. He remembers that the total is less than 10,000 which is worth knowing for some of our contestants who, notwithstanding frequent warnings, continue to find 29, 39, 49 and numerous other double formations, in the chart. Totals thus obtained run all the way from 20,000 to 40,000 and are as far from right as it is possible to go without adding in some figures that do not exist.

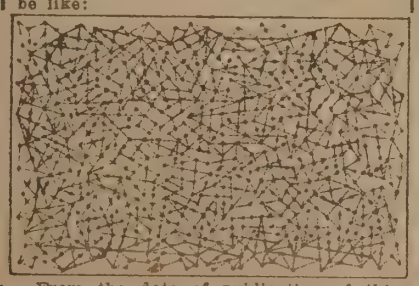
Gwen.—Count the figures and forget him. However, let us hope that he will always cherish such scruples against your working. If you win the first prize of $275 he will have more respect for your "unbridled energy," as you say he calls it.

F. K.—Do not know the number of "3's" or "9's" in puzzle chart, my sole information being the total of all the figures when added up as if they were in one long column.

B. G.—Thank you for the information that the author of the poem, "He Met Her in the Meadow," lives at Alexandria, Va. The other verse to which you refer was written by James Whitcomb Riley and reads:

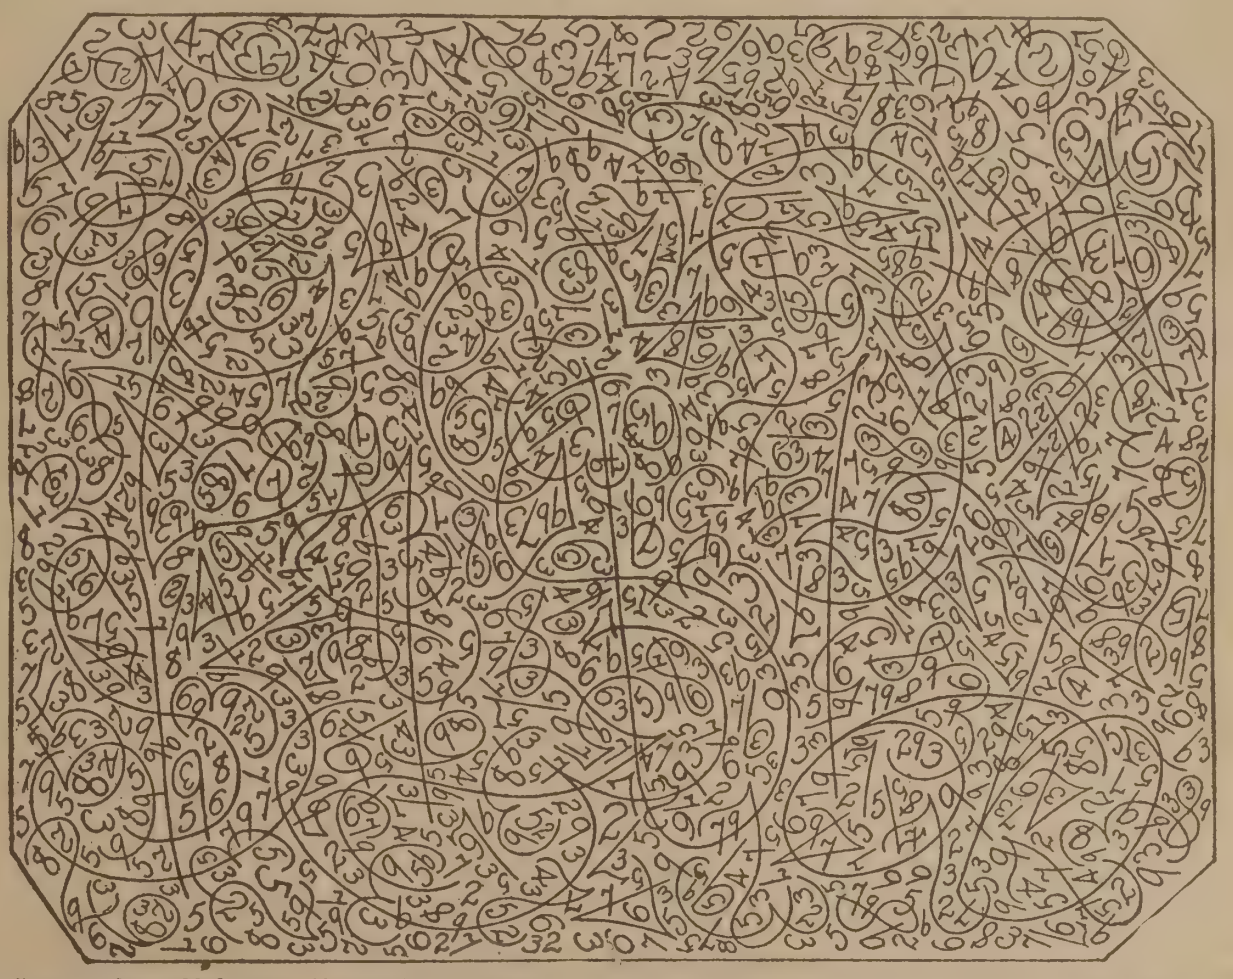
I'm bin a-visitin 'bout a week
To my little cousin's at Nameless Creek,
An' I'm got the hives an' a new straw hat,
An' I'm come back where my beau lives at.

H. K.—All prizes in the figure contest will positively be paid in cash, checks going forward to prize winners just as soon as possible after the contest is decided. Relative to your question about prohibition, there will be 26 states in the dry column after the legislatures of Utah and Florida meet. There are several other states in which it is a long time between drinks and where prohibition is only a matter of a very short time, such as Minnesota, Kentucky, Maryland, New Hampshire and Texas. The success of national prohibition is dependent on the success of prohibition in 36 states, the ratification by the legislatures of three-fourths of the states being necessary to the adoption of an amendment to the federal constitution.



Deciding Ties

In the event of ties on the first problem, those tying will be required to solve a second puzzle, like the small illustration, only considerably larger. Only those tying on the first problem will be eligible to solve the second, or tie-breaking, problem.



The second problem will involve drawing a continuous line through the greatest possible number of dots. Rules for solving the second problem will be published more fully in event that it becomes necessary to present it, and these rules, together with extra charts, will be mailed to each tying contestant just as soon as possible after all answers to the first puzzle have been received and registered. The small illustration simply gives an idea of the nature of the second problem, and nothing can be done toward solving it until it is determined whether there are any ties on the first puzzle, which will be known after March 17, 1917.

In case of ties on the second problem, the same problem will simply be rearranged and another solution asked from those tying on the second problem. If two or more persons tie for any prize on third solution, each will receive the full amount of the prize instead of a division being made of the prize money.

This is what the second problem will be like:

From the date of publication of this second problem one week will be given for its solution.

This Is How to Do It

Simply add up the figures in the puzzle chart as if they were in one long column. Your success depends on the accuracy of your total thus obtained.

Figures run from two to nine, and there are no double figures or characters which are not figures. The tail of the "6" has a decided curve, while the tail of the "9" is straight. All other figures have the usual characteristics, allowing no question as to the identity of any figure.

In event that no one submits the correct total, prizes will be awarded for the next nearest solutions.

This contest is restricted to persons residing in Washington, Idaho, Oregon and Montana.

A payment of $1 to $1.50 on subscription to the Farmer entitles the subscriber to enter the contest.

If your subscription is already paid in advance, your expiration date will be set ahead beyond this date to which you are now paid the full period for which you pay at this time. The advantage of paying $1.50 instead of $1 is that the winner of any of the first four prizes receives additional prize dividends apportioned on the amount paid in on subscription, besides the fact that $1.50 during this contest pays for a three-year subscription to the paper, while $1 pays for only one year.

More than one solution may be submitted by any contestant, by an additional subscription payment of not less than $1 nor more than $1.50. It is not necessary to pay the same amount with each solution if more than one is submitted.

You can send in a subscription for some one other than yourself and have the solution registered in your own name. Remember that by paying $1.50 instead of $1 on subscription, the larger will be your dividends if you win one of the four leading prizes; but not more than $1.50 will be received with one solution.

$750-Prizes-$750

FIRST PRIZE, $200,
to which will be added 50 times the amount paid by the subscriber with the winning solution. For example, if you pay $1.50 on subscription, this prize will be worth $275.

SECOND PRIZE, $100,
to which will be added 30 times the amount paid by the subscriber with the winning solution. This prize may be worth $145.

THIRD PRIZE, $60,
to which will be added 20 times the amount paid by the subscriber with the winning solution. This prize may be worth $90.

FOURTH PRIZE, $50,
to which will be added 10 times the amount paid by the subscriber with the winning solution. This prize may be worth $65.

FIFTH PRIZE, $40.

SIXTH AND SEVENTH PRIZES, Each $20.

EIGHTH TO SIXTEENTH PRIZES, Each $7.

SEVENTEENTH TO THIRTY-SECOND PRIZES, Each $2.

CASH MUST ACCOMPANY.

Don't send in your charts and working papers unless called for by the Contest Editor. Simply write your solution in blank space provided in "Registration Blank."

Remember, the contest closes March 17, 1917.

Stiff Upper Lip

Advice Which Helped One Man

What is the quotation or what are the words which have helped you in the journey of life?

Is it a phrase from some famous author or was it the words from some neighborly soul who helped you over a hard place and left you the invaluable legacy of a life motto?

What are your favorite motto, your favorite quotation, your favorite words?

Send them to the editor of the Farmer and let those words help another which have helped you.

To the Editor of the Farmer: I will give you a quotation which was given to me a number of years ago by a business firm, to whom I had written about a bill I was owing them, and I wanted some extra time. Their answer was: "Keep a stiff upper lip and go ahead," which meant, go ahead and do the best you can.

I have always remembered that and have kept it in practice.

L. F. DAVIS.

Rainier, Wash.

Emergencies

Supplies That Should Be on Hand

By Alice W. Barland.

When my children were small there were a few things I always kept on hand and where I could find them without delay. These articles are necessities in every household. They are a package of court plaster, a package of surgeon's plaster, a five-yard package of sterlized gauze, which should be kept in a fruit can closely sealed, a bottle of boracic acid, a package of absorbent cotton, a bottle of alcohol or peroxide, and a bottle of olive oil.

In addition to these things I always kept a sack of old cotton cloth carefully washed and boiled and had always in it an old, worn sheet that would make long bandages. Many a time there has been a sudden frantic appeal to me for large bandages for a horse injured on the barbed wire fence.

We used to think it a part of the process of healing that the injured part should swell and go through a long period of supperation, but nowadays we have learned better and know if we keep the impurities out of a wound it will heal in a clean manner.

I should have added a bottle of camphor and a piece of alum to the list above. When one feels a "cold sore" swelling on the lips either camphor or alum, if applied at once, will heal it before it hardly starts.

Powered alum will usually stop excessive bleeding and sometimes seems to be the only thing that will stop it. Common baking soda covered over a burn will give instant relief.

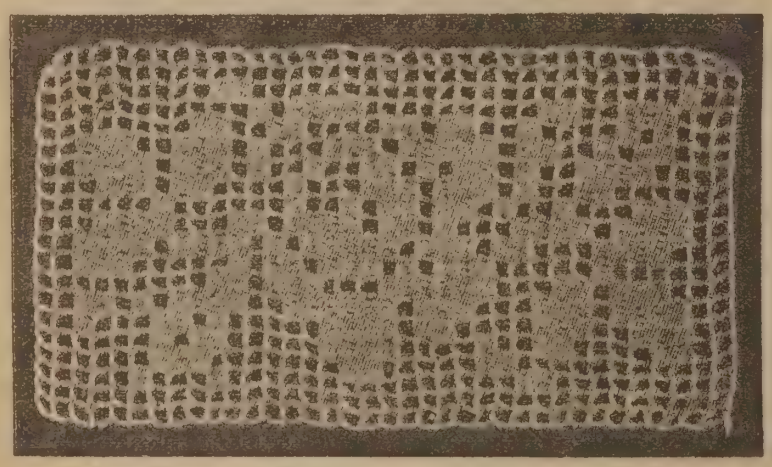
Should you have a child taken with convulsions first place a silver spoon between the teeth to protect the tongue then without a moments delay place the child in a tub of warm water. Leave in the water only long enough to see the tense jerking motions relax, then lift out and roll in a flannel blanket. The child will go to sleep and awaken in a normal condition.

Convulsions are caused most frequently from indigestion, therefore one should be watchful of the diet of a child subject to convulsions, and above all prevent constipation.

Little Home Helps.

Did you ever sow a few parsley seeds in a plant can and grow in the window with the house plants? It is so nice to have a few leaves for winter garnishing.

Did you ever try lifting the cookies from bake-board to pan with your pancake turner? It is easier to keep them nice shaped that way, especially if you are making great, big ones.



Did you ever slip a newspaper between the house plants and the window glass on cool nights? It is an easy way to keep the plants from chilling on nights not cold enough to warrant taking from the windows. E. Q.

To Test Woolen Goods.

To test woolen goods dissolve two rounded teaspoonfuls of common lye crystals in a cup of water. Boil for three or four minutes and the wool will become a pulp and any cotton threads present will be unaffected. Use two samples of equal size. Test one and use the other sample for comparison.

Popular Crochet Designs

By WINIFRED WORTH

Rose design for sash curtain.

All crochet workers will be glad to learn this practical design, as it is easily done if the given instructions are followed.

For the 20 open meshes chain 60.

First and second rows—Make 20 open meshes in each row, then follow design. The design as it appears measures 8 inches made from No. 3 cordinet, but would not measure so much made from finer thread. Be sure that the center of the rose comes in the center of the curtain. The remaining length can be either of open meshes or the pattern at each end and also the center.

School Lunch

Put Responsibility on Pupils

It is much better to have a child eat his lunch in a comfortable place than if he is permitted to eat a cold lunch on the school house door steps or on the wood pile, says Leila W. Hunt, assistant professor of foods and cookery at the Washington State college, in a bulletin entitled "The Hot Lunch for Rural School." Often such a cold lunch is made up simply of left-overs.

In adition to the better nutrition of the child, there may be learned lessons in courtesy, table manners and common social customs by using the hot school lunch. A lesson in the economy of time and material is worth while and may be taught. Other things that might be gained are the bringing of the school and home more closely together by interesting the mothers and fathers in the work. Girls could be taught lessons regarding the planning and serving of meals; boys may be interested in gardening.

The Plan.

All of the responsibility should not be placed upon the teacher, but the pupils also should share the work and the responsibility. Parents should be interested and should share their part of the burden. Mothers might be invited to the school and plans discussed with them. They might be induced to provide some food occasionally—such as baked beans, soup stock, milk or vegetables. Perhaps it will be necessary for the teacher to estimate and plan the bill of fare, furnishing at least one warm dish at noon. This can be provided at a small cost—say 3 cents, 4 cents or 5 cents a child and each one can bring a sandwich or two of bread and butter from home. The cost should be kept as low as possible. Usually milk and vegetables are in plenty and farmers are usually generous with these products, so a good plan is to ask them to donate such foods to the school. Sometimes the woman's club of the community will coperate by furnishing supplies and equipment in an enterprise of this kind. In a consolidated rural school one teacher might be selected to give a lesson in cooking to a few pupils every noon and to supervise the serving of the luncheon. Make this a community work.

Potato Recipes

Simple Directions for Preparing

The following recipes for potatoes, prepared by the office of home economics for club work of the department of agriculture, show a few of the many uses of the wholesome potato:

Stuffed Potatoes.

A nice way to vary baked potatoes is to cut a slice from the top of each and scrape out the inside. Mash, season with salt, pepper, chopped parsley (if liked), and butter and heat in a little hot milk; add two well-beaten whites of eggs. Refill the skins, sprinkle with grated cheese, and bake in a hot oven about six minutes.

French Fried Potatoes.

Wash, pare and cut into eighths lengthwise. Soak in cold water one hour; drain and dry between towels. Fry in deep fat, which must not be too hot. Drain on brown paper and sprinkle with salt.

Shoestring Potatoes.

Potatoes cut in long, narrow strips and prepared by the above recipe are called Julienne or shoestring potatoes.

Panned Potates.

Cut cold boiled potatoes into quarter-inch slices; dredge lightly with flour and fry in pan with a little butter. When light brown, heap on side of pan; let stand a few minutes, then loosen with a knife and turn out on a platter in much the same way that an omelet is taken out. Sprinkle with salt and serve at once.

Production of Peanut.

The peanut, or ground nut, although grown in places all over India, as a garden and even an occasional field crop, is produced on a commercial scale only in the Madras and Bombay presidencies, in Burma, and that part of French India (Pondicherry) that adjoins Madras.

Acclimated Seed Wanted

Demand Can Be Reached Through Want Ads

Turn over to the "want" ad page of this issue and notice the seed classification.

Space in this department may be secured at a reasonable rate by those who are able to offer good, clean, acclimated seed.

These "want" ads will take your offer into more than 50,000 farm homes in the Pacific northwest. In a large proportion of these homes there is undoubtedly a demand for seed that has been tested out under the conditions and climate peculiar to this section.

We believe our seed classification will prove of real service both to those who have acclimated seed to sell and to those who want to buy and plant it.

If you have something in this line that you've tried out on your own place and know is good, let us hear from you.

Save Strength

By Keeping Work Done Ahead

What is the most helpful thing you have learned during the past year in your experience with housekeeping? Let us pass it along to other housekeepers.

To the Editor of the Farmer: What is the most helpful thing I have learned during the past year in my experience with housekeeping?

This is a hard question to answer as one learns something every day and I often wonder how we ever got our work done without the learning we get by experience.

I read all the papers and get many helps from them and often wish there were more recipes both in cooking and fancy work in the Washington Farmer.

Learn to conserve your strength by keeping your work done ahead. Take plenty of time to read and keep the mind on beautiful things and the body will never seem tired. This is the best thing I have learned.

MRS. W. C. BOWMAN.

Mondovi, Wash.

Patterns

1965-1816—Ladies' costume.

Waist 1965 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 1816 cut in 6 sizes: 22, 24, 26, 28, 30 and 32 inches waist measure. It requires 6 3-4 yards of 44-inch material for the entire dress for a medium size. Two separate patterns, 10 cents for each pattern.

1952—Ladies' house dress.

Cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. It requires 6 1-8 yards of 44-inch material for a

36-inch size. The skirt measures about 3 yards at the foot. Price, 10 cents.

1963—Ladies' apron.

Cut in 4 sizes: 34, 38, 42 and 46 inches bust measure. Size 38 requires 5 1-4 yards of 36-inch material. Price, 10 cents.

1589—Girls' dress.

Cut in 4 sizes: 4, 6, 8 and 10 years. Size 8 years will require 1 3-4 yards of 36-inch material for the guimpe, with 2 1-8 yards for the dress. Price, 10 cents.

1951—Girls' slip, with or without envelope chemise finish.

Cut in 6 sizes: 4, 6, 8, 10, 12 and 14 years. It requires 2 1-2 yards of 36-inch material for a 10-year size. Price, 10 cents.

1973—Dress for misses and small women.

Cut in 3 sizes: 16, 18 and 20 years. It requires 5 5-8 yards of 44-inch material for an 18-year size. The skirt portion measures 2 3-4 yards at the lower edges. Price, 10 cents.

Kale

Makes a Good Winter Vegetable

This is the time of the year when the farmer's wife finds it hard to get enough fresh vegetables to make a variety in the daily menu. With onions this year at 4 cents a pound and cabbage, celery and rutabagas a poor crop, there isn't much left but carrots, parsnips and Hubbard squash.

I wonder how many of our countrywomen know that the young sprouts of the thousand-headed kale make delicious greens for the table. They are very wholsome and a good substitute for spinach and should be included in the diet of every family who is fortunate enough to have a field of kale on the farm. When properly gathered and properly cooked and served, it is sure to be liked by every one who likes greens.

It is a common dish in the British isles and if you have any Britishers in your family you will find they will give the kale greens a hearty welcome. In gathering them, remember that it is the young, new shoots that sprout at the joint of the big leaves on the main stalk that will make tender greens. When I have a large field to pick from I take just the heart of each plant, which includes three or four leaves, none larger than your hand. The plants keep on throwing out new sprouts for another month or so. The kale is at its best after the heavy fall frosts, and is at its best right new. It will begin to go to seed late in February and after that will not be tender and palatable.

For six or eight people gather a market basket full, then wash in several waters to shake out any worms or insects. Then put in a large kettle and cover with boiling, salted water; remove cover as soon as it boils up well and boil briskly 15 or 20 minutes, or until it is soft and tender, but not too long or it will be dark and watery. Put in a colander to drain and chop with a sharp, big knife or in a chopping bowl. Put in a hot, buttered dish and serve very hot with bits of butter laid on top and well salted. A tablespoonful of cream added to each dish as it is served adds a delicate, mellow flavor liked by many.

For variety a cream sauce with a chopped hard boiled egg in it, poured over the greens, makes the dish attractive and more nourishing, and appeals especially to children, who sometimes do not fancy greens at first.

These greens are especially appropriate with pork or any rich meat course. Like spinach, kale greens are considered healthful for their laxative effect and as a help in purifying the system.

Pictures

Seen by Little Jim in the Fire

By Laura Pearson Felton.

There was something strangely pathetic about the patches on the knees of the blue overalls and the holes in the toes of his stubby shoes as he lay in the glow of the fire from the hearth—something strangely pathetic about the way this man-child of nine summers pillowed his smooth cheek on the sleeve of his worn blouse.

There was a far-away look in his eyes as he listened to the steady creak of his mother's chair as she rocked and sewed. He only half heard the creak of the chair, for, mingled with it, he thought he could hear the shouts of the other boys as they rode by in a wagon for town and the "movies."

How he did want to go tonight! All the other fellows were going. There were to be pictures of the Pendleton roundup and most everybody would be there—everybody except mother and him.

A feeling of resentfulness came over him. Why must mother alawys sit in her chair and sew and why must he lie and listen to the creak, creak of the chair?

The other fellows got to go to town real often and had money to buy pop and ice cream cones. Yes, and their mothers didn't always sew, either. He guessed he knew. He had seen them reading or doing fancy work when he went on errands for mother. He had to go quite often to return some sewing mother had done for them, or some ironing or something.

The other fellows always said: "Aw, come on and play a while, Jim. That ironin' 'll keep," or, "Guess you've earned that nickel—sneak it and we'll go to town to the show." But the small head had always shaken and the lad had answered, "No," and would trudge off with his share of the work.

All these things little Jim pondered over as he lay looking into the fire and a feeling of rebellion crept into his heart.

Presently the firelight took on a softer glow and there came visions of the little mother always smiling, always working. Sometimes she was washing, sometimes ironing or baking. And always in the evening she sat in the low chair sewing—every evening except Sunday and then she would sit and read to little Jim as he lay by the fire. Sometimes, on rare occasions, she would make a plate of taffy and they would pull it and laugh when it stuck to their fingers. But always, in frolic or at work, Jim could see in his vision, a halo about his mother's head and he wondered vaguely what it meant.

As he gazed into the glowing embers he saw another picture of his mother as he came upon her unawares one day. She was sitting by the kitchen table, her head upon her arms, and he was not sure, but he thought he saw her sholders quiver. He had slipped away quietly and had been glad he had not sneaked the nickel as the fellows wanted him to.

Then he saw the little mother as she knelt beside the bed one night to pray. She thought he was asleep. He saw the slender mother-form in her white night gown as she knelt there and he heard her pray, "O God, make me brave; give me courage and strength. Keep my boy free from sickness, sin and all harm, dear Lord."

And again he had been glad that he had done his errands well and willingly.

The firelight flickered and he saw another picture. It was his mother's face as he had seen it when they brought his father home all bruised and still. Even then her thoughts had been not of herself, but of him, her boy, who would be without a father. O, how plainly he could see the pictures of the days that followed! As the logs of the fire shifted and rolled out on the hearth he could hear the dull thud of the clay as they dropped it in the open grave.

A dry sob chocked him. He felt a soft hand on his head and heard a sweet voice saying, "Come, little son; it is late and the fire has burned low. Did you know you had gone to sleep?"

How gentle her touch, how sweet her voice!

"Why, what's the matter, boy dear; you look as if you had seen a ghost?"

Little Jim swallowed a lump in his throat and said: "No, mother. I've been seeing moving pictures in the fire. They were wonderful pictures."

Little Jim understood the halo of the dream picture. To him it stood for courage, unselfishness, truth and love.

Scalloped Potatoes.

Wash and pare potatoes; let them soak for a half hour; and cut in one-fourth inch slices. Butter a baking dish, put in a layer of the sliced potatoes, sprinkle with salt and peper, dredge with flour and dot over with one-half tablespoon of butter. (A little grated cheese may be sprinkled over each layer if desired.) Repeat until the baking dish is nearly filled, then cover with hot milk. Bake one and one-fourth hours in a moderate oven, or place on the back of the stove and cook slowly.

The Motor Car

On the Farm

Road Map Sign.

A large board sign upon which has been painted a road map of the district has been erected near Roscoe, Cal., by the Automobile Club of Southern California.

How Much Do You Use?

The present gasoline consumption in this country amounts to 1,750,000,000 gallons per year. One-fifth of the gasoline products of this country have been shipped abroad for the last two years.

Dripping of Cylinder Oil.

Speaking of the benefits derived from such fine roads as the Pacific highway, E. E. Ware of Chehalis calls attention to the menace to teams from the constant dripping of cylinder oil. "Sooner or later, the roads will have to be sanded, or something of the kind," he predicts. "Even now they sometimes get too slippery for a team to get a good footing on them."

Gasoline for 138 Years.

A note of alarm concerning the gasoline supply of the country was sounded at the convention of the Society of Agriculture Engineers at Chicago by Dr. Oscar F. Bransky of the Standard Oil company.

He declared that production was not keeping pace with consumption and that exhaustion of the supply was drawing near. The tension was considerably relieved, however, when it was calculated that the estimated remaining supply of crude oil, visible and invisible would last 138 years at the 1916 rate of consumption.

Dr. Bransky said that next year there would be 3,000,000 automobiles in operation in the United States, or 750,000 more than this year. He estimated that castern oil fields are 75 per cent exhausted; midcontinental fields 50 per cent; Texas fields 80 per cent, and California fields 35 per cent exhausted.

BULLFROGS AND PUSSYWILLOWS.

The first genuine harbinger of spring has already arrived at this place despite it being somewhat early, which is believed to be the earliest for many years. The bullfrog chorus is getting in shape for the spring concerts. Real pussywillows are out in almost full force while lilac bushes and other shrubbery are showing signs of growth with buds swelling perceptibly. Wild Oregon grape is shooting out its green buds and violets are in the budding stage.

EDWARD LOUIS SACHTLER.

Ridgefield, Clarke County, Wash.

Spend More on Education

People of Washington Demand More, Get More

Former President Bryan of the State College of Washington reminds the people of Washington that if they are spending a great deal more money on education than they were spending per capita a decade or two ago, they are demanding more and getting more in return. Mr. Bryan says:

The excellent and useful tax articles of E. D. Cowen have one weak spot in their logic. Because the expenditure within the state for education has increased in the last 20 or 25 years faster than the population, or even the assessed valuation of the state, it does not necessarily follow that the expenditure is now too high. It may just as well follow that it was then too low.

In the case of higher education the state expended, about 1890, $5000 a year, which was undoubtedly too low. We can not assume that the expenditure was then correct and that all increases have been wrong. Then there were less than five standard four-year high schools in the state. Now there are over 150 accredited high schools. Of course these cost more than those, but our children have correspondingly better opportunities.

Without a doubt there have been mistakes and extravagances in school expenditures of all grades, and these ought to be corrected as far as possible. But merely because we have more and better educational facilities now and pay more for them than did our forebears is not proof that we are wrong and they were right.

College and high school education is diffused today among the masses to an extent that was unknown a generation ago. Whether we are happier, more prosperous or even more progressive for the change admits of some debate. Australian conditions seem to throw some doubt around the question.

"One of the anomalies of Australian life," says the National Geographic Magazine for December, "is their attitude toward education. In a country where the government digs a man's well, sells him fish, and tells him when to open his store, and where 98 per cent of the adult population can read and write, it is strange, indeed, that interest in higher education should be so slow in developing.

"Free public education from kindergarten to a university degree, giving equal opportunities to rich and poor of both sexes, is not known in Australia. The numbers enrolled in secondary schools, both public and private, and in universities are therefore relatively small.

"The states of Washington (United States) and Victoria (Australia) have about the same population, but the Washington high schools enroll four times the number of pupils, and the state university enrolls four times as many students.

"To my mind the chief reason is the low valuation placed on higher education; too few are willing to obtain it at a personal sacrifice. Stories of American boys and girls without money, who by the thousands work their way through school and college by sacrificing their holidays and vacations, performing menial services and living on meager fare in cheap lodgings, read like fiction to the son of the Australian laborer."

Yet we are told by the same writer that "the day laborer, as opposed to the employer and other workers, is king in Australia. The unions, through the labor party, practically control the executive, legislative and judicial machinery of the cities, the states and the commonwealth.

"Forty-eight hours is the recognized maximum for a week's work; but in certain occupations, 44, 42, 40 and even 36 hours are considered full time.

"On the basis of doing a moderate amount of work amid agreeable surroundings, most Australians are workers. * * * With a short, easy day for the business and professional man and for the wage-earner, with Saturday afternoon free and frequent holidays, the Australian has the energy and the time for amusement, which, because of the climate, take largely the form of outdoor sports.

"The desire for money is in most cases a desire to secure a competence, not to secure power and prestige by amassing a huge bank account. Wealth is so diffused that nobody is really poor and few are very rich."

Quick Sale of Duroc Swine

Two boars sold for $50 each and an offer of $75 for another that was not for sale—all from the first insertion of a small ad on the breeders' page of

The Pacific Northwest Farm Trio.

Such are the gratifying results secured by Doerfler Bros. of Silverton, Oregon, breeders of fine Durocs.

If you have good stock to sell tell our more than 50,000 subscribers about it and get quick action. Write today for our rates and let us tell you about our free ad service.

MABEL SAW THE PLACE WHERE FORD CARS ARE MADE

Dear Aunt Nellie: I am going to write about the holidays. Thanksgiving is when we thank God for our crops and Christmas is the birth of Jesus and the day of giving. New Year is first day of the new year. I live on a farm two and a half miles south of Oroville. We have two horses, Sunday and Pet, and three cows and three heifers. The cows' names are May, Dolly and Susie, and the heifers' names are Midget, Betsy, Blossom. I have a horse named Ted and three pullets and one rooster. I have one sister and two brothers. Their names are Julia, Ferber, Gilbert. I go to school in town. The name of the school is Southside school. We have five studies. They are arithmetic, spelling, reading, geography and language. The study I like best is geography. I am going to write to some of the cousins and I also am going to write to Genevieve McCauley of Dayton. Now I am going to tell you of my visit to the east, on the train. I saw many things. The first city we came to was Spokane and then we went through Idaho and we saw the twin cities and I saw where the Munsing underwear was made. I also saw where the Ford car was made. Then we went to Campbellsport, Wis., where I visited with my uncle and aunt and cousins. I am 10 years old September 19. I ride to school in a school wagon. I am in the fourth grade.—Mabel Schlef, R. R., Oroville, Wash.

LEARNING TO READ SWEDISH AT HER SUNDAY SCHOOL

Dear Aunt Nellie: I live on a farm and have lots of fun. I go to school and am in the fourth grade. I am 10 years old and 5 feet 2 inches tall. I have blue eyes, light hair and weigh about 100 pounds. My birthday is September 24. For a pet I have a cat named Lucky. My sister has a cat named Beauty. We also have a dear little calf named Beauty. It is all white excepting its ears are dark at the end and it has a dark ring around its neck which looks like a necklace. We have three cows and two heifers and two horses. We have over a hundred chickens. I have three brothers and three sisters. Two brothers and one sister are older than I. My oldest sister and I are almost the same size and we do have lots of fun together. I can tat and crochet a little.

I go to Sunday school and learn to read, talk and sing in Swedish. While at the public school, I learn English. I would like to see this letter in print. —Ethel Sandberg, Box 45, Olalla, Wash.

THEIR FARM IS ON THE SHORES OF LONE LAKE

Dear Aunt Nellie: I will tell you about our farm. We live on a 40-acre farm on the shores of a lake called Lone lake. It is a very pretty lake. We calle our place Lake View Farm. I have two pet cats. Their names are Tommy and Nigger. Tommy is six years old and Nigger is one. I will be 12 years old September 6. We have one horse and seven milk cows and two calves. We have about 350 chickens. I have two sisters and one brother and his name is Bennett. My sisters' names are Olive and Dora. Bennett is 13, Olive is 6 and Dora is 3 years old. Bennett is in the sixth grade, and I am in the fourth. Olive is in the primer grade. We have four rooms in our schoolhouse. There are 84 pupils in our school. My teacher's name is Miss Hazel Thomas. Bennett's teacher's name is Miss Ruth Davey, and Olive's is Mrs. Helen Howell. I like my teacher very much.—Adolph Olsen, Route 1, Box 17, Langley, Wash.

STELLA TELLS THE COUSINS ABOUT HER CHRISTMAS

Deaur Aunt Nellie: My birthday is June 11, and I am 8 years old. I got some toys for Christmas, a painting set, a hair ribbon, a story book, a handkerchief, and a game of Tiddley Winks. We had lots of candy Christmas. We had a program at the church and my sister had to speak.—Stella Stuurmans, R. F. D. 1, Lynden, Wash.

HATCHING EGGS FREE.

Hatching eggs from prize-winning pens of poultry FREE to thrifty boys and girls who will give the Washington Farmer a little of their time. Write today to Washington Farmer, Room 37, Review Building, Spokane, Wash.—Adv.

PLAY FOOTBALL IN THE FALL BUT MARBLES NOW

Dear Aunt Nellie: I am 9 years old and am in the fourth grade. I have two brothers and one sister. The oldest brother's name is Thomas and he is in the second grade. The other's name is Ross. The girl's name is a name I never heard before. It is Orena. We live in a lumber town and there are some farms around here too. My father is the superintendent of the mine. There is a Buick to carry the lumber out in the yards and the man that drives it taught me how to drive it. I go to the Lebarn school and we have about a mile and a half to walk every morning. We are having a vacation of two weeks. We play football in the fall but just now we are playing marbles. I have a lot of them. On the rainy and snowy days we play in the auditorium of the schoolhouse. The schoolhouse is quite a big one. There are about 200 pupils in the whole school. I have not missed a day in spelling this year and have not missed a day at school or been tardy either. If I do not miss a day or be tardy I will get a diploma at the end of the year with a gold seal on one end of it.—Grant Armstrong, Globe, Wash.

GRACE AND HER DOG HAVE GREAT FUN ON THE BEACH

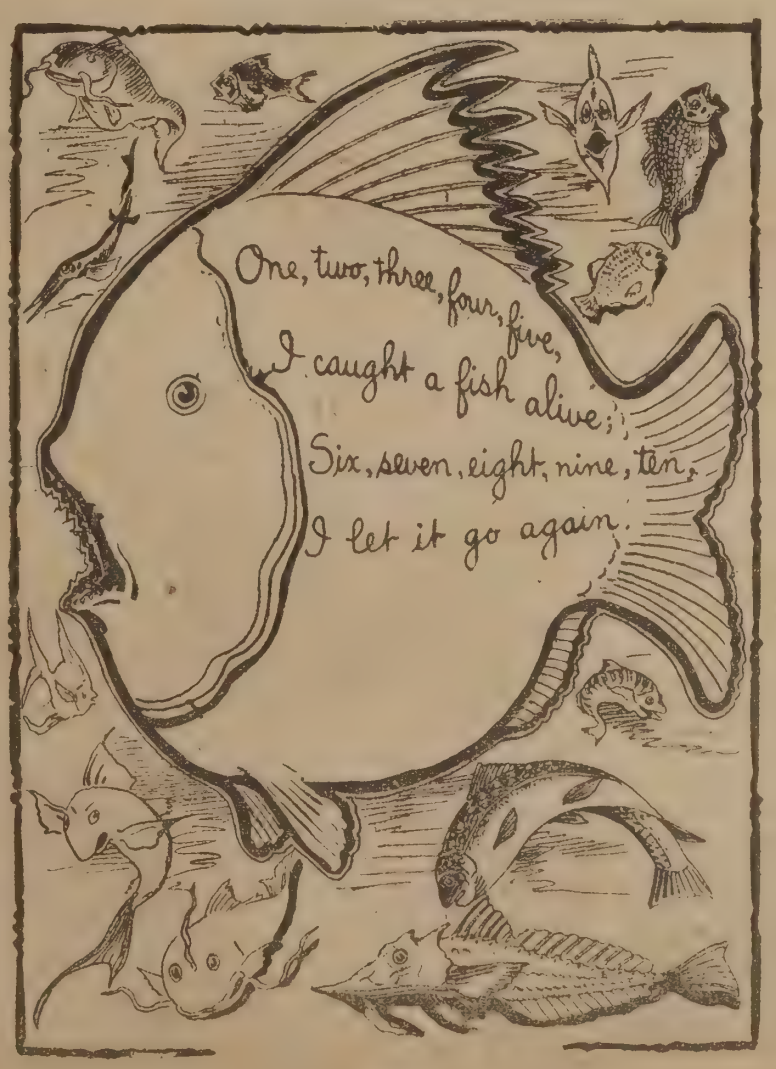
Dear Aunt Nellie: My subject will be "In the Summer." In the summer I help mama in the morning and then my dog, Tippy, and I go down to the beach that we live by and go in bathing and have lots of fun. I get on a log and stand up with my dog on behind and paddle out till the water is as high as my head and then I jump off and swim a ways, but then come back to the log and get on again. My dog and I have lots of fun. We go picking wild flowers on an island called Dinner island. It is covered with lilies in the summer time. They are very big, some are four on a stem. I have all sorts of fun on the beach. I am 10 years old and am in the fifth grade. My birthday is August 22.—Grace Humbly, R. F. D. 2, Box 2, Friday Harbor, Wash.

IDA LOVES BEST OF ALL TO HAVE TRUE FRIENDS

Dear Aunt Nellie: I am 13 years old. I am going to write about what I love and hate. I love to have true friends and I love to be kind to them, too. I love my sister, who is taking care of me, and I think all the other girls who have no mother and are being cared for by their sister ought to like her. I love Christmas because it is the day Christ was born and we have a grand celebration. I hate to have untrue friends, and I also say the same as Enis Erickson, that I hate to be cruel to animals. I do not like selfish people, either. I think all the other girls will agree to what I say. I think that Enis Erickson and Alice Mortan wrote lovely letters. I wish to corerspond with them and many other girls of the Corner. We had a little program and a Christmas tree at school. Since the last time I wrote to the Corner we have have seven new scholars. Now we have two Franceses, two Johns, two Rubys, two Franks, two Marys and three Roses.—Ida R. Diliak, Buckeye, Wash.

EUNICE'S COLT ISN'T BIG ENOUGH TO RIDE YET

Dear Aunt Nellie: I am a little girl 10 years old. I am in the third grade. My birthday is June 24. My father has a Flanders car. My teacher's name is Miss Browning. I like her fine. My brother is in the eighth grade. I have two brothers and three sisters. My oldest brother is 22 years old and the other is 16 years old. My oldest sister is 31 years old and the other two are 26 and 20 years. Two of my sisters are married and one of my brothers is married. I have a colt. It's mother died. My colt is not big enough to ride yet. We live on a farm of seven acres. My father has four head of horses and four head of cattle.—Eunice Martin, box 124, Riverside, Wash.



ADDIE O'ROURKE WRITES ABOUT HER SCHOOLROOM

Dear Aunt Nellie: In my schoolhouse there is only one room. The stove is in a corner and the library is, too. There is a few paintings on the wall. There are some new seats and some old ones. We have two swings and a pair of trapeze. The girl comes to the same school I do that got the big doll from Aunt Nellie. I am 13 years old and will be 14 May 5.—Addie O'Rourke, R. R. 1, Reardan, Wash.

MAUDE LIKES TO READ THE COUSINS' LETTERS

Dear Aunt Nellie: I am 10 years old. I am in the fifth grade in school. My teacher's name is Miss Mussen. My birthday is May 31. We live on a 160-acre ranch. I read the letters the children write and think they are fine.—Maude Bailey, Box 53, Malo, Wash.

I Caught a Fish Alive

THE TWINS HAVE TWIN PONIES OF THEIR OWN

Dear Aunt Nellie: We are twins, who enjoy reading the Children's Corner. We are 10 years of age and are in the 7B grade at school. We live in the country and have many pet turkeys and two small horses named Kewpie and Beauty. They are twins and are 4 years old. Their mother is a large bay horse, but they are both black. One has a white spot on the end of his nose, the other a white spot between his eyes. We have lots of fun riding our ponies to and from school. We live in the country and have three miles of good graveled road to go to school on. We go to school in town and there is a nice playground for us to play on, and a hot dinner at noon. In the summer we have a small flower garden and papa helps us make our playhouse. We have a baby brother, 4 years old. His name is Harold Edgar Black. We got lots of nice things for Christmas, and among them were two little gold watches for us. We spent our Christmas vacation at Seattle with our aunt, uncle and three cousins. Our aunty gave us each a lavalliere.—Thelma and Alma Black, Wash.

CLAYTONE GOES HUNTING SOMETIMES WITH HIS DOG

Dear Aunt Nellie: This is the second time that I have written to the Children's Corner and I read every letter that is in the paper, so I thought I would write again. I want to tell you some more about our farm. We had 10 cows and sold two of them so we have only eight now. I go hunting with my dog. Sometimes I go to Menlo to see my friend and he has a "twenty-two." I killed a bluejay with it. I killed it just as it was going in the chicken house to steal an egg. I will tell you what I got for Christmas. I got a little game, a necktie, a pair of sleeveholders and two handkerchiefs. When school started after vacation, we moved into the new schoolhouse and it has electric lights, electric bell, and an electirc fire bell. In case of fire there is a glass and a little hammer. It says, "In case of fire break this glass." I am 12 years old and in the fourth grade.—Claytone Beeson, Globe, Wash.

ETHEL LIKES TO WALK TO SCHOOL IN THE SPRING

Dear Aunt Nellie: My father is serving on the jury in Tacoma and my oldest brother is in bed with the measles. I have two brothers and one sister and one of our cousins is staying with us. My oldest brother is 15 years old and he is in the 10th grade. My youngest brother is 11 years old and he is in the seventh grade, and my sister is 9 years old and in the third grade. My cousin is the same age and in the same grade that my youngest brother is in. I live on a farm. We have 18 head of cattle, two mules, and their names are Kitty and Jennie. We have one dog and his name is Prince. I walk one mile to school. I like the walk to and from school, especially in spring. I am 13 years old and I am in the eighth grade.—Ethel Duke, Alder, Wash.

ROBERT HAS ONE CAT THAT HE CALLS TABBY

Dear Aunt Nellie: I am a little boy 6 years old. I like to read the Children's Corner. I am in the second grade. My teacher's name is Mr. Ayers. I like him very much. We have two horses and four head of cattle and 14 pigs. I have one brother and one sister. Their names are Edward and Alice. I have one cat and its name is Tabby. I have a sled. My birthday is June 10. Have I a twin?—Robert Fisher, R. F. D. 1, Colbert, Wash.

LORENA HAS NEVER BEEN ABSENT NOR TARDY YET

Dear Aunt Nellie: I live on an 80-acre farm. We have six cows, six cats, two horses and five pigs. I milk two of the cows. I am 10 years old and in the fourth grade. I am the only girl in the family. I have three brothers. Their names are Henry, Walter and Fred. I have three miles to walk to school. I have never been tardy nor absent. My teacher's name is Miss Howell and I like her very much.—Lorena Ross, Langley, Wash.

EDITH HOLM IS A BIG HELP TO HER MOTHER

Dear Aunt Nellie: This is the first time I have written to the Children's Corner. I am 10 years old and am in the fifth grade at school. My sister Agnes is 16 years old and is in the eighth grade. My birthday is September 12. I live on an 11-acre farm. We have one horse and one cow and about 400 chickens. I like the farm very much. I help mamma wash dishes, sweep the floor and make the beds.—Edith Holm, Box 5, Olalla, Wash.

Grain and Produce Markets

Chicago Grain.

CHICAGO, Jan. 27.—Wheat prices collapsed today under heavy selling due to rumors that peace was in sight. After an extreme break of 7 1-8c the market reacted, but closed weak, 1 1-2c to 6c net lower, with May at $1.75 3-8 to $1.75 1-2, and July at $1.47 3-8 to $1.47 1-2. Corn finished 7-8c to 1 1-4 @1 3-8c down, and oats off 1-8c to 1 1-4c. Provisions scored gains of 5c to 12 1-2c.

Notwithstanding that peace talk appeared to have only the flimsiest of backing in the way of specific new developments, the wheat market plunged swiftly downward as soon as trading opened. Rallies which ensued were quickly followed by a much greater descent than at first, and it was not until the last hour of the session that the flurry was in a measure overcome by week-end evening up of business.

Bearish sentiment was notably increased by the striking absence of fresh export demand for wheat and by assertions that railway congestion was again as bad as ever.

Corn yielded grudgingly to the influnce of wheat.

Oats followed the downturn of other grains. Seaboard demand proved slow.

In provisions the chief factor was strength of hog prices. Peace talk was likewise a deterrent against selling.

Car Receipts at Coast Points.

Receipts of grain and hay in car lots at Coast points for the fiscal year beginning July 1 up to Saturday night for 1916-17 and 1915-16 were as follows:

Seattle.	Wheat.	Oats.	Barley.	Hay.
1916-17	3834	833	779	2682
1915-16	6462	737	1105	2931
Portland.				
1916-17	3648	1630	145	1520
1915-16	9140	820	1330	1512
Tacoma.				
1916-17	4487	234	110	1406
1915-16	5733	251	482	1654
Total.				
1916-17	11969	2697	1034	5856
1915-16	21335	1808	2917	6097

Spokane Market.

The wholesale prices quoted in the list below are not the prices paid to producers or shippers; they are those charged by the Spokane commission houses to the retail trade for standard produce. The prices quoted for live stock, however, are the prices given to the producer.

Potatoes — Potatoes, $2.25@2.50 cwt; sweet potatoes, $6.

Apples—Washington apples, cooking, 60c@85c; eating, $1@1.25; Wageners, 85c@$1.35 box; Jonathans, $1.25@1.35 box; Winter Bananas, 80c box; Kings, $1 box; Spitzenburgs, $2 box; Baldwins, 90c box; Delicious, large, $1.75@2.25 box; Rome Beauties, $1.25 box; Winesaps, $1.75@2 box; Y. N. Pippins, $1.75@2 box.

Butter—Blanchard cartons, 40c lb; Medo-Maid, 40c lb; Cascade, 40c lb; Gold Coin, 36c lb; Gold Leaf, 40c lb; Better butter, 40c lb; Hazelwood, 40c lb; Peerless, 38c lb; Jersey Belle, 39c lb; Attalia, 40c lb; Diadem, 40c lb; Jersey, 38c lb.

Cheese—Wisconsin full cream, twins, 28c; triplets, 28½c; Hazelwood full cream triplets, 22c lb; Wisconsin limburger, 23c lb; brick cheese, 28c lb; domestic Swiss, 35c lb; western cream, Idaho or Oregon twin or triplets, 24c lb; Young Americas, 26c lb.

Eggs—Fresh local ranch eggs, $13.50@14; fresh eastern eggs, $13 case; eastern storage eggs, $10.50 case.

Live Poultry—Springs, 14c lb; hens, 13@14c lb; old roosters, 6@7c lb; ducks, 11@13c lb; turkeys, 20@27c.

Dressed Poultry—Hens, 17c lb; springers, 17c; old roosters, 10c; ducks, 15c; geese, 14c turkeys, 28c.

Hide Quotations.

Green cows and steers—25 lbs. and up, 16½c; salted cured, 19c; green bulls and stags, 13c; salted cured, 15c; kip, 15 lbs. to 25 lbs., 21c; calf skins up to 15 lbs., 30c; dry flint hides, 32c; dry salted, 27c; dry calf skins, under seven lbs., 38c; dry sheep pelts, full wooled, 20-23c; dry shearlings, 10-75c each; green horse hides, $3 to $5 each; dry horse hides, $1 to $2 each.

Butter and Eggs.

SAN FRANCISCO, Jan. 27.—Butter—Fresh extra, 38c.

Cheese—New, 18½c.

CHICAGO, Jan. 27.—Butter—Higher. Creamery, 31½@37½c.

Eggs—Receipts, 829 cases; unchanged.

ELGIN, Ill., Jan. 27.—Butter, 45 tubs at 39c, 10 tubs at 38c.

PORTLAND, Ore., Jan. 27.—Butter—Steady; cube extras, 38c.

Portland Market.

PORTLAND, Ore., Jan. 27.—The upward trend of the wool market continues. In the latter part of the week the Portland Wool Warehouse company sold 200,000 pounds of Heppner fine staple of the 1916 clip at 33 cents. This is the best price ever paid for this grade of wool in this section. The first consignment of early shorn mutton wool has been received from Roch creek, near Arlington. The wool contract market is inactive.

Oregon onion growers have advanced the selling price of onions to $6 a sack, but no sales have been made yet at this extreme quotation. The demand for potatoes has also been checked by the high prices ruling.

An advance of 3 cents in butter has raised the local print price to the highest of the season. Cubes are firm, but have not advanced accordingly. Another car of cheese was sold to go east during the coming week. The cheese market is firm and on the eastern basis.

The decline in egg prices has been checked by the receipt of orders from Spokane and Montana cities. Poultry and dressed meats are holding steady.

A fair business in hops is reported, with Oregons selling at 5 to 9 cents and western Washington at 10 cents.

In the following list of quotations the grain, hay, millfeed, hop, wool and hide prices are those paid to producers. The other quotations are prices from jobbers to retailers:

Oats—No. 1, $35.75 per ton.

Corn—Whole, $46; cracked, $47 per ton.

Millstuffs—Bran, $26.50 per ton; shorts, $30.50.

Barley—No. 1 feed, $38; brewing, nominal; rolled, $41@42.

Hay—Buying prices. Timothy, eastern Oregon, $19@20; alfalfa, $15@16; clover, $11; grain, $12@13.

Eggs—Oregon ranch, case count, 32@33c per dozen; candled, 35@37c.

Poultry—Hens, 16@18c; ducks, 20@22c; turkeys, live, 18@20c; dressed, 22@25c; geese, 12@14c.

Butter—City creamery, prints, 40@43c per pound; cubes, 38 1-2c.

Cheese—Oregon triplets, 20c; Young Americas, not quoted.

Dressed meats—Veal, 14 1-2@15c; pork, 13 1-2c.

Hops—1916 crop, 5@9c.

Potatoes—Oregon, jobbing price, $2.25@2.50 per cwt.

Onions—Buying price, $6 for country points.

Wool—Eastern Oregon, fine, 28@33c; coarse, 33@36c; valley, 35@41c.

Beans—Small white, 11 1-4c; large white, $11.10 per 100 pounds.

Hides—Salted hides (25c lbs. and up), 19c; salted stags (50 lbs. and up), 15c; green and salted kip (15 lbs. to 25 lbs.), 18c; green and salted calfskins (up to 15 lbs.), 27@28c; green hides (25 lbs. and up), 17c; green stags (50 lbs. and up), 13c; dry hides, 30c; dry salt hides, 25c; dry horse hides, $1 to $2; salt horse hides, $3 to $5.

Seattle Market.

SEATTLE, Jan. 27.—As long as Yakima holders can get bids of $55@60 for No. 1 gems f. o. b., which they are still doing, Seattle jobbers do not hope to work over any weaknesses in the market. Quotations here vary from $58 to $65 with a $70 level in immediate prospect, but sales under $65 were made possible only on purchases by wholesalers earlier in the season, and holdings of this stock are phenomenally light.

Seasoned traders are endeavoring to dissuade growers from increasing their potato acreage for the crop year of 1917, convinced that extremely low prices are to come next fall because of plans already made.

Onions are very firm at 6c per pound. Oregon is now the dominating spirit of the trade with practically all the holdings on the Pacific coast.

There has been a better movement this week of extra fancy apples, Spitzenbergs at $1.75@2, leading in popularity.

BUYING PRICES.

Unless otherwise stated the following prices are fixed upon a jobbing basis and are average prices obtained in reports of transactions by jobbers.

The following prices are offered to the producer by the local dealers for delivery in round lots f. o. b. Seattle:

Eggs—Local, 32@33c per dozen.

Poultry—Live hens, fat, over 4 lbs., 18c per lb.; do, 3 lbs. and under, 15c; old roosters, 10c per lb.; springs, 18c per lb.; ducks, 19c per lb.; squabs, large, $3.50 per dozen; geese, fat, 12c per lb.; turkeys, live, 24c.

Butterfat—43c lb.; dairy butter, 28c per lb.

Beef—Buying price: Prime beef steers, 8c per lb.; cows, fat, 5@6c per lb.

Hogs—Light, 11 1-2@12c per lb.; do, heavy, 10@11c per lb.

Veal—Fancy light, 12 1-2@13c per lb.; do, heavy, 9@10c per lb.

Hides—Salted, 19c per lb.; salt kip, 22c per lb.; salted calf, 32@35c per lb.; green hides, 16c per lb.; salted bulls, 15c per lb.; dry hides (short trim), 32@33c per lb., dry calf, 12c; (under six lbs.), 36c per lb.; bull and dry salts, 4c per lb. less; green bulls, 13c per lb.; dry butcher full wool sheep pelts, 20@23c per lb.

Seattle Wheat.

SEATTLE, Jan. 27.—With the heavy sales of wheat in the country this week Washington farmers have let loose of all their 1916 wheat and holdover up to 5 per cent, and due to the difficulty of securing cars between 10,000,000 and 15,000,000 bushels are held by eastern buyers in this territory. These, together with new high prices to farmers, are the dominating features of the week. Records of $1.60 for bluestem, and $1.62@1.63 with charges added, which buyers were compelled to pay, established some phenomenal net prices to farmers of this state.

Quite a little club wheat changed hands during the struggle for milling bluestem. Millers bought some for sale in the east, but not for grinding, as they are well supplied on much lower purchases to the end of the season. One mill bought 100,000 bushels of club for shipment east. General bids by millers in the country were $1.54 for bluestem, $1.50 for club and $1.50 for fife, although there is little fife left in Washington that has not changed hands.

Portland Wheat.

PORTLAND, Ore., Jan. 29.—Wheat trading came to almost a complete stop in the latter part of the week. With the slumps at Chicago prices here were scaled down severely. The drop put an end to all offerings by farmers and buyers considered it useless to put out bids. The demand from the east and California has ceased for the time being. The larger dealers welcome the lull in trading, as it gives them an opportunity to devote all their energies to dispatching wheat previously sold.

Closing bids at the local exchange for February wheat were: Bluestem, $1.57; forty fold, $1.54; club, $1.52; red Russian, $1.51.

Oats and barley shared in the weakness and bids for both cereals were reduced.

No change in flour or mill feed prices has been announced.

The hay market is heavily stocked and weak.

Live Stock Quotations.

At Chicago.

CHICAGO, Jan. 27.—Hogs—Receipts, 17,000; unsettled, 5c above yesterday's average. Bulk, $11.35@11.60; light, $11.10@11.60; mixed, $11.15@11.70; heavy, $11.20@11.70; rough, $11.20@11.35; pigs, $9.25@10.60.

Cattle—Receipts, 700; steady. Native beef cattle, $7.75@11.90; western steers, $7.75@10; stockers and feeders, $6@9; cows and heifers, $5@10.25; calves, $11@15.

At Omaha.

OMAHA, Jan. 27.—Hogs—Receipts, Higher. Heavy, $11.20@11.45; light, $10.90@11.30; pigs, $9.50@10.25; bulk of sales, $11@11.35.

Cattle—Receipts, 100. Steady. Native steers, $8@11; cows and heifers, $7@9; western steers, $7@10.50; Texas steers, $6.50@8; stockers and feeders $6.50@10.

At St. Paul.

SOUTH ST. PAUL, Minn., Jan. 27.—Estimated receipts at the Union Stock yards today. Cattle, 800; calves, 200; hogs, 4200; sheep, 300.

Cattle—The supply for Saturday was made larger than usual at the week-end by a lot of stuff that arrived too late for Friday's market. It included a fair showing of beef steers at $9@10 and fat sheep stock up to $8. A straight load of steers brought $9.25.

Hogs—Some of the loss registered in the trading on hogs here yesterday was regained in the market today, when prices were quoted steady to a nickel higher. Good heavy sorts were given the definite boost and went back to an $11.20 top. Bulk of sales were registered between $11 and $11.10.

Sheep—Sheep house trade had been on a firm basis all week. Higher price levels are in effect on most classes. Lambs of top grade are selling at $13.50@13.75, with seconds at $11@12 and good heavy lambs at $12@13.

At Portland.

PORTLAND, Ore., Jan. 27.—Hogs steady; receipts, 81. Bulk of packing grades, $10.90@11; heavy packing, 215 to 250 pounds, $11@11.10; heavy butchers, $11@11.10; light packing, 170 to 190 pounds, $10.90@11; rough heavy, $9.50@10.25; pigs and skips, $9@9.50; stock hogs, $8.25@9; cripples, $8@9.

Cattle steady; receipts none. Steers, prime light, $8.35@8.50; prime heavy, $8@8.35; good, $7.75@8; cows, choice, $7.35@7.50; medium to good, $6.25@7; ordinary to fair, $5.75@6.25; heifers, $4 7.50; bulls, $3.50@5.50; calves, $6@8.

Sheep steady; receipts, 494. Lambs, east of mountains, $11.50@12; lambs valley, $11@11.50; lambs, good, $9.75@10.25; choice yearlings wethers, $9.75@10.50; good yearlings, $9.50@9.75; choice ewes, $8@8.50; heavy ewes, $6.75@7.50.

At Seattle.

SEATTLE, Jan. 27.—Receipts, 577 cattle; 468 hogs.

Hogs—Prime light hogs, $11.25@11.35; medium to choice, $10.35@10.60; smooth heavy, $10.10@10.45; rough heavy, $9.25@9.85; pigs, under 150 pounds, $8.50@9.15.

Cattle—Prime light steers, $9; medium to choice, $8.25@8.50; common to good, $6.50@7.75; medium to choice, $7@7.25; common to good, $5@6.50; best bulls, $5@5.75; common bulls, $3.50@4.50; calves, $7@9.

Sheep—Prime lambs, $10.25@10.50; good lambs, $9.75@10; wethers, $8.50@9; ewes, $6.50@8.

Spokane Stock Yards Saturday.

Hogs—Receipts, 176; market steady. Prime heavy, $10.90@11; prime light, $10.65@10.85; prime mixed, $10.10@10.40; rough heavy, $10@10.25; stockers, $7@8.75; bulk of sales, $11.

Cattle—Receipts none; market steady. Prime heavy steers, $8.35@8.65; prime light steers, $8@8.25; good steers, $7.75@8; stockers and feeders, $5.50@6.50; prime cows, $7@7.50; good cows, $6.25@6.75; best heifers, $6.75@7.75; bulls, $3.50@5.50; calves, $6.50@9.

Sheep—Receipts none; market steady. Prime lambs, $11@11.50; common lambs, $10@10.75; best yearlings, $9.50@10.25; good yearlings, $8@8.50; best mutton ewes, $7.75@8; common ewes, $6@7.50.

San Francisco Produce Market.

SAN FRANCISCO, Jan. 27.—Butter—Fresh extras, 38c; prime firsts, 36½c; fresh firsts, 35½c.

Eggs—Fresh extras, 32½c; pullets, 31c.

Cheese—New, 18½c; Young Americas, 20c.

Poultry—Hens, 21@22c; old roosters, 12@13c; fryers, 24@26c; broilers, 27@30c; large, 25@27c; squabs, $2.25@2.50; pigeons, $1.25@1.75; ducks, 16@18c; geese, 18@20c; turkeys, live, 23@25c.

Onions—Carloads, $7.50.

Potatoes—Rivers, $2.40@2.65.

WHEAT, ALFALFA

and other grains yield more where a perfect seed bed is prepared. The **Western** pulverizes, packs and mulches—makes a perfect seed bed at one operation. Saves seed, time and horse power. Is especially adapted for breaking crust on winter wheat or other grain or in orchards after irrigation or packing rains. It forms the hardest crust into a granular mulch without hurting the grain, and prevents evaporation.

Western Pulverizer, Packer and Mulcher 3 Machines in 1 made in 8 sizes, 1 and 3 sections, prices $20 and up. We want every farmer to have our free catalog before buying a roller or packer. It proves we can save you money and have far the best machine. Contains full description, price direct to you, letters from many farmers proving its advantages over other makes, and much other valuable information. Send for it today.

Want Ad Rates 30c Per Line

Want ads are run at this rate in The Washington Farmer and its associate papers, The Oregon Farmer and The Idaho Farmer, thoroughly covering the three states.

Want Ads

How to Figure Cost of Ads

Figure four words for the first line, which is set in capital letters, and six words for each succeeding line. Multiply number of lines by 30 and you have cost each issue.

POULTRY 174 Continued.

This classification introduces the person who wants to buy purebred poultry to the person who can fill his or her order satisfactorily. If you have breeding stock, hatching eggs or chicks to sell, now is the time to advertise.

MAMMOTH BRONZE TURKEY, BEST IN the west. Unrelated stock. Mrs. H. J. Cortner & Mrs. C. R. Lowery, Payette, Ida.

LIVE STOCK 177

PUREBRED STALLIONS.

We have for sale a few 1-year-olds, 2 this spring, Shire stallions, our own breeding; also a 5-year-old and an 8-year-old Shire stallion, both brown; a 3-year, a 7-year-old and 1 aged Percheron stallion, all black; one 2-year-old Brown Clyde stallion, bred by Canadian government. The oldest horses have been taken in exchange, mostly for colts of our own breeding, and can make you a cheap price on them. We sell at the barns only, and tell you all we know about each and every horse, guaranteeing them to be as represented or refund your money.

Our horses won all firsts and champions at Spokane Interstate Fair, N. W. Live Stock Show, Lewiston, Ida., and Pacific International, Portland, Ore., last year. If you need a horse, or want to exchange, write us, or, better, come and see them before buying. It will pay you.

G. M. WILSON, WILBUR, WASH.

SELLING OFF STOCK.

1 Ayreshire bull, Robin Hood stock; 20 grade cows, milk test 40 to 55 at Monroe condensery; 9 heifers, yearling this spring; 2 horses; machinery, separator, cans, etc. Total of 31 head; machinery and all for $2550. Cows are above average and are all big milkers. Good chance for some one. Chas. J. Davis, Tolt, King county, Wash.

50 BRED SOWS AND GILTS, 50 OF TRUE Berkshire type and quality, bred to grand champion boars, are included in our private sale list now ready for mailing. Write for it today. Silver Birch Farms, Bx. R, Newport, Wash.

MADDEN & BURNS, CALDWELL, IDAHO.

THOUSANDS OF ACRES OF FINE LAND. Irrigated, logged-off and general farming land; along the new lines of the Chicago, Milwaukee & St. Paul Ry. Write or call for free booklets. Immigration bureau, C. M. & St. P. Ry., 2nd and Cherry st., Seattle, Wash.

CALIFORNIA FARMS FOR SALE. WRITE for list. E. R. Waite, Shawnee, Oklahoma.

FARM LANDS—FOR SALE 651 Continued.

WHY GO TO MONTANA OR CANADA WHEN YOU CAN BUY BETTER WHEAT LAND IN WASHINGTON FOR $20 PER ACRE? EASY TERMS.

720 acres, or will divide into smaller farms. This land is in the famous Waterville-Mansfield district, where there is plenty of water and moisture and the soil is a good, dark loam, with a clay subsoil; produces 30 to 40 bushels of wheat per acre; part of it is in cultivation, and practically all tillable; it lies close to the railroad and near a good town where there are good schools, churches, stores and other conveniences. The climate is excellent, and plowing can be under way very early in the spring. No severe winters to combat. This section of the country produces a very hard wheat, which commands the top price. We can sell this land for ¼ down and the balance a long time, at 6 per cent. Did you ever hear of anything better?
ARTHUR D. JONES & CO., SPOKANE.
ARTHUR D. JONES BLDG.

YOUR CHANCE IS IN CANADA — RICH lands and business opportunities offer you independence. Farm lands $11 to $30 acre; irrigated lands, $35 to $50; twenty years to pay; $2000 loan in improvements, or ready-made farms. Loan of live stock; taxes average under 20c an acre; no taxes on improvements, personal property or live stock. Good markets, churches, schools, roads, telephones; excellent climate—crops and live stock prove it. Special homeseekers' fare certificates. Write for free booklets. Allan Cameron, Gen'l Supt. Land Branch, Canadian Pacific Ry. 92 Ninth ave. Calgary, Alberta.

MONTANA GRAIN AND STOCK FARMS IN Shields River valley, Judith Basin and Great Falls district. Good land for stock-raising, $7 to $15 per acre; grain land, $20 to $40 per acre; small cash payment, balance easy terms, at 6 per cent. Several good farms, with one-fourth or more in crop. Can take some good property as part payment on quite a number of good Montana farms. Call or write for Montana land list. HEGE & SCHIFFNER CO., 715-17 PAULSEN BLDG., SPOKANE.

BARGAINS IN FARM LAND.

Our business is loaning money on farm and city property. Occasionally we have properties for sale which have come into our possession on account of foreclosure of loans. These we offer at practically the net cost to us, which is far below their real value; a small payment down, the balance on easy terms, with low rates of interest. Send for list.

NEWS FOR BREEDERS

Sophie 19th and Her "Golden" Calf

C. I. Hood of Lowell, Mass., has refused to consider a $25,000 offer for this calf and for whose mother, Sophie 19th, he refused an offer of $50,000. Sophie has a record of two and three-fourths tons of butter in six years, which is given as the greatest ever made by a cow of any breed.

Swine Sale

Wilsons Sell Registered Stock

By A. E. GIPSON.

At the sale of registered swine held by Wilson Brothers of Greenleaf, Idaho, January 17, there was a surprising demand for registered animals on the part of farmers. The entire listings that were catalogued were quickly sold and more could have been disposed of had they been available. Thirty-three head were sold at an average of about $46, the total sales being $1575.

This is significant as showing the confidence of the farmers in the future of the hog and their willingness to invest in purebred animals. All of the purchasers were farmers and the stock was nearly all bred gilts and sows of different ages.

Live Stock Lectures.

The sale was held in a large tent which had been erected and warmed for the occasion. Preceding the sale lectures on live stock and demonstrations in judging were given by Professors Leland and McCall, the former government project advisor and the latter county agricultural agent for Canyon county.

Colonel A. J. Miller, the auctioneer in charge, also gave a pertinent talk on improved live stock and the importance of good foundation animals in building up the industry.

At night, under the auspices of A. L. Wilson, an illustrated lecture was given in Greenleaf academy by Professor Ireland on live stock, showing the conformation and points of merit of the best types of dairy cows and other animals.

A. L. Wilson believes in the future of Idaho as a center of quality animals and that animal husbandry is destined to put the farmers of the state on a safe financial basis. He leaves for the east soon to be present at some of the important gatherings of live stock breeders in different states.

The following are the buyers at the Wilson sale:

J. A. Van Cleef, Greenleaf; Lewis Griffith, Caldwell; E. V. Gipson, Caldwell; E. M. Hurlburt, Greenleaf; O. E. Peret, Greenleaf; J. S. Hurlbert, Nampa; B. F. Leavel, Parma; O. O. Womack, Parma; R. M. White, Caldwell; B. F. Leavill, Parma; William N. Rhodes, Greenleaf; William Womack, Parma; S. D. Williams, Greenleaf; Isaiah Williams, Greenleaf; John Tish, Caldwell; J. W. Root, Caldwell; W. C. Altig, Greenleaf.

REGISTERED SHORTHORN BULL.

L. M. Beal bought while at Portland a registered Shorthorn bull for his farm in the Kuna country. This will be followed by the purchase of a number of registered cows of the same breed.

Woman Deputy Sheriff.

Logansport, Ind., has a woman deputy sheriff.

WEST SIDE MAN BUYS SHORTHORNS

Among the western Washington men who have purchased breeding stock from the Hercules farm of Day & Rothrock at Sprague, Wash., is Sylvester Egan of Kent, Wash. Mr. Egan purchased the bull calf, Diamond Prince, the individual that won second prize in his class at both the Lewiston and Portland shows and headed the calf herd that was first at Lewiston and second at Portland. The heifer he acquired is a 2-year-old roan, which has been bred to Gainford Perfection, the Hercules herd sire, the bull that made many winnings in Canada during 1914 and 1915.

"The interest among farmers generally in high-class stock is on the increase," says Harry L. Day of the Hercules farm. "We are receiving inquiries and calls daily to an extent never dreamed of two years ago. Farmers generally have been enjoying a reasonable prosperity during the last two years to the extent that they feel able to improve the condition of their live stock, and are realizing now that this phase of their business should not be neglected."

NEWS IDEAS ABOUT HORSES.

A correspondent of the Cologne Gazette, discussing the subject of live stock interests in Germany as affected by the war, expresses an opinion that many of the popular ideas concerning horses and horse-breeding will have to be considerably modified. His chief points may be thus enumerated:

(1) Seeing that cavalry horses are likely to be almost negligible in future, breeding for army purposes certainly requires no stimulus; (2) as the future of racing is exceedingly doubtful, thoroughbred horses may not be largely wanted, so that the government studs should be utilized for the breeding of more general utility animals; (3) that blood sires and half-bred or coarser mares should be mated with extreme care, since the offspring may turn out to be anything except what is desired, and may have no type; and (4) that the horse-breeding industry should be conducted as an ordinary matter of business apart from considerations having reference to military and racing purposes.

PACIFIC INTERNATIONAL.

The Pacific International Live Stock exposition for 1917 has been given its initial appropriation of $3750 from the American Shorthorn Breeders' association of America, of which Frank W. Harding is executive secretary. This sum, according to O. M. Plummer, secretary treasurer of the Portland Union Stock yards, where the annual show is held, is 50 per cent greater than the sum received from the same source last year.

Wanted to Know.

"Who were Adam and Eve, grandma?"

"They were the first man and woman, dear."

"Were you 'quainted with 'em, grandma?"—Boston Transcript.

We Will Pay Salary To Farmer With Rig or Saddle Horse

The publisher of The Washington Farmer wants men to secure and renew subscriptions to this paper in various farming districts throughout the state during the winter months. We are going to pay good salaries to those who can do the work.

We have decided to offer these positions only to farm owners or renters.

We feel sure there are many of our readers who would like to earn some extra cash during the winter months when work around the place is slack.

We want to hear only from those who will be willing to give our proposition a fair trial for at least a month and who will put in good hard licks for good pay. For men or women with these qualifications the opportunity is a splendid one. This work isn't easy; but you can do it and earn a good salary during the winter months, without neglecting your farm chores—without being away from home more than a few hours each day. We give you full instructions and the right kind of help.

You will be able to earn a salary of from $25 to $150 per month or even more, dependent upon the amount of time and effort you can give to the work. Salary check will be sent promptly at the end of each month.

We will not consider an applicant who does not live on a farm and who does not have a rig, saddle horse or automobile. In writing us tell whether married or single, whether you own or rent your place and give the names of two merchants with whom you trade. There isn't any red tape about our proposition, but we must know something about those workers we put on our payroll to receive a monthly salary check.

Give full details in your first letter. If we get two or more applications from one neighborhood, the first will be given the preference in making our appointment. If you want a good salary proposition for the rest of the winter, don't wait till tomorrow to write us, but send your application today.

If not interested personally in the above proposition, why not get some neighbor or friend in touch with us at once who you think will appreciate an opportunity to make several hundred dollars during the winter months. You will be doing both him and us a favor.

Address your letter to Publisher The Washington Farmer, Review Building, Spokane, Wash.

One Hundred Thousand Paid in Commissions

Trading Company Officers Pocketed Third of Receipts From Stock

Out of collections of $315,636 for stock in the Northwestern General Trading company sold by agents and officers of the company, $101,011 were paid to such agents and officers as commissions, according to testimony and figures submitted in the trial in the federal court at Spokane last week. One item in this commission was, according to the witnesses examined and the documents submitted, $10,000 paid to Gale Smith, president of the company, in addition to his regular salary. Another item was $1000 paid to C. L. Davies as commission on the day following the filing of voluntary proceedings by the company in bankruptcy.

Much documentary evidence was submitted, including a large number of letters passing between the men now on trial. In these letters such terms as "mossbacks," "steam rollers," "cleanup," "big deal," "hot air," "jar loose" and "stand pat" were found frequently. The following are extracts from some of the letters:

We will make a cleanup if things go right.—C. L. Davies, manager Portland branch of Northwestern Trading company, October 9, 1914.

Some of these mossbacks are hard to jar loose from their coin.—C. L. Davies, September 14, 1914.

I don't know whether or not we will use the steam roller method; but if necessary we can do it, as we have plenty of gasoline and hot air.—S. T. Knudson, president of the Olympic Trading and Supply company, November 9, 1914.

If necessary get the steam roller in position and have it well fired up; and if you find it necessary, start it rolling and put them to sleep.—F. B. Sears, Northwestern Trading company, Spokane, to Knudson, November 12, 1914.

The steam roller is a rather necessary adjunct at these meetings, and when it gets started it has to run quick and fast.—F. B. Sears, November 19, 1914.

The Farmers' union bunch are standing pat with us with the exception of Mr. Dilivuk.—C. L. Davies, February 27, 1915.

I am rather inclined to think that it is good weather to go to South America.—C. L. Davies, April 1, 1915.

FILE BANKRUPTCY
But Continue Taking Commission.

One of the most startling revelations in the trial so far was in the testimony of H. S. House, special examiner for the federal department of justice, who testified that the officers of the company and their agents received 20 per cent commission on the stock they disposed of to the farmers and other, and that C. L. Davies, one of the officers now on trial, was paid or paid to himself $1000 in commissions after the company had actually filed its voluntary proceedings in bankruptcy, in which it was shown to be insolvent.

"During the time Davies was drawing commissions he was also on salary, being paid $150 a month, and after January 1, 1915, $225 a month," said Examiner House while on the witness stand. "He drew in salary $2225 and in commissions $2591."

"At the time the Northwestern went into voluntary bankruptcy had Davies collected all commissions due him?" inquired District Attorney Garrecht. "He had," replied the witness.

"State when was the bankruptcy filed." "April 23, 1915."

"After the date of the petition for bankruptcy were any commissions paid Davies?" inquired Attorney Garrecht. "Yes, on April 24, 1915, he drew $1009.75."

"How much in commissions was then due Davies?" "The books show $9.75."

"How was this $1000 shown on the books?" "It was charged to Davies as commission account."

"Was this sum ever repaid to the company?" "It was not."

"SOME GRANGER"
Davies Works From the Inside.

Not content with having secured the indorsement of the state grange and the farmers' union after a supposed investigation by committees of which C. B. Kegley, master of the grange, and J. C. Lawrence, now one of the defendants, were members, C. L. Davies became a member of the grange himself, apparently for the purpose of impressing the farmers with the supposed fact that he was working with and for them. He describes himself as "some granger" in a letter written from Portland to Gale Smith, president of the Trading company, announcing also that Mr. Kegley "and his bunch" had indorsed the company. The letter follows:

"Portland, Nov. 7. 1914.—Dear Gale:

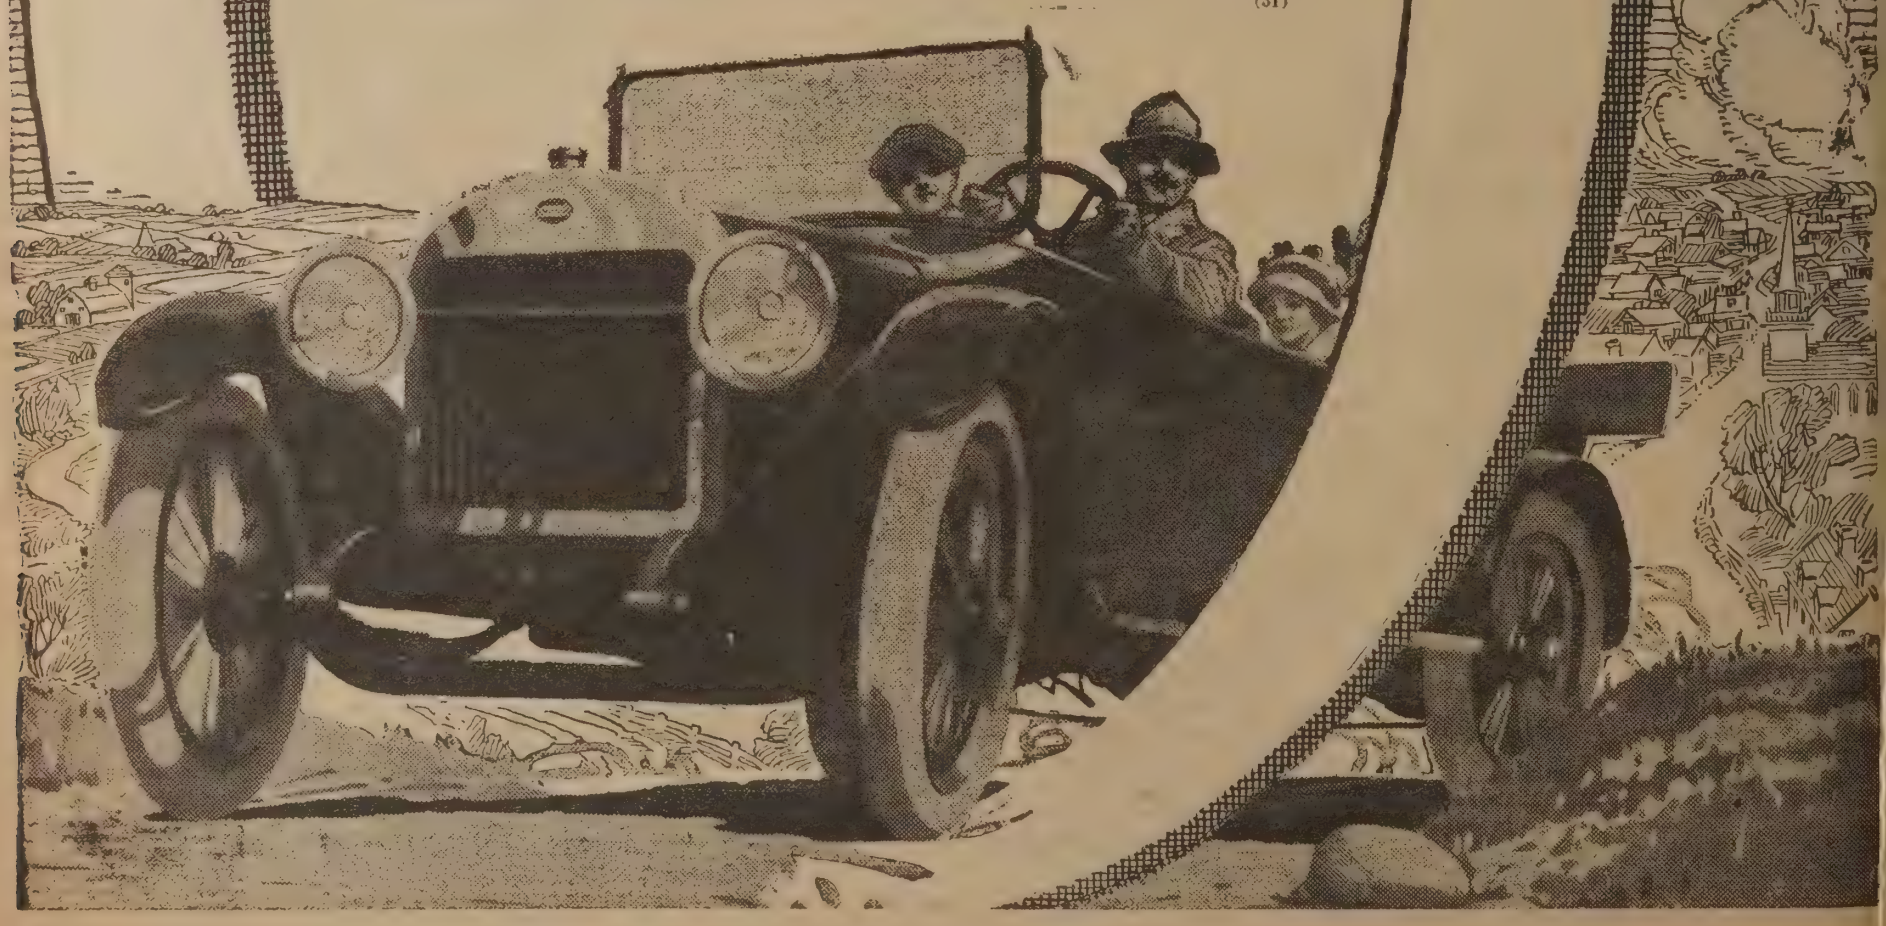
(Continued on page three.)

How many tons of root crops can you grow on an acre?
How many pounds per day would be a good ration for a cow?
How many days would the yield of the acre feed the cow?
Read "The Value of Field Roots," by Thomas Shaw, on page 4.

Oakland Sensible Six

"Sturdy as the Oak"

Get the *real* thrill of the open road in an *Oakland Sensible Six*. The valve-in-head motor develops full 41 h. p. at 2500 r. p. m.—one h. p. to every 53 pounds of car weight.



And every mile is an easy mile. The big, over-size tires, 32x4, the long, semi-elliptic springs, 51" in rear, 112" wheelbase, all make the *Sensible Six* one of the most comfortable and easy riding cars of its size ever built.

It has the power, comfort, good looks, reliability you want in an automobile—yet it is sensibly priced—$875, and built to operate at moderate cost.

Oakland Eight—$1585—is a big luxurious 73 h. p., 7-passenger touring car for those who demand the utmost in power, speed and luxury.

OAKLAND MOTOR COMPANY, Pontiac, Mich.

One Hundred Thousand Paid In Commissions

Books Show That Trading Company Officers Pocketed One-Third of All Collections for Stock

(Continued from page one.)

Mr. Kegley and his bunch have finally indorsed the company. It took a long time to bring them over. I was up at Washougal yesterday and had a talk with Mr. Wing, one of the executive committee, and signed him up for a share of stock. He is the one that was bucking our proposition last spring at Washougal. We have him in line now; are getting him out and putting him to work undoing what he did last spring. That is the way to fix these fellows that knock. When they kick the brick wall down make them get in and build it up again.

"I am joining the grange down here and am going to be initiated tonight. I will be come granger, believe me. Heretofore when I wanted to arrange a meeting I would get in for a few minutes and then they would kick me out. But I am going to be in a position where I can go to their grange meetings and stay until the last dog is hung.

"I am glad to hear that you are gettings things lined up there with a bunch that are capable of getting the business. I trust that you will be able to run onto some new proposition that will be of benefit to us. CLYDE."

LAWRENCE INVESTIGATES
And Pronounces Company Sound.

One of the charges made by the prosecution in the Trading company case is that John C. Lawrence, one of the defendants, was in the employ of the Trading company receiving a regular salary from it at the time that he acted as a member of the farmers' union committee which investigated and indorsed the company. A letter in proof of this contention, signed by Lawrence, was read into the record.

Quick Dividends Promised.

Promises of the immediate payments of dividends was made to some purchasers of stock in the Northwestern General Trading company, according to the testimony of witnesses in the trial of Gale Smith and associates, Thursday in the federal court on a charge of using the mails to defraud.

Witness after witness testified that he was induced to buy stock under representations that were afterward found untrue, among these being the allegations that the company bought its goods in carload lots for cash and gave wholesale prices to its patrons.

Stock sales agents made promises, causing purchasers subsequently to repudiate their payments. This action was generally followed by a series of dunning letters threatening lawsuits, some of which were sent out under the disguise of the Inland Mercantile company, owned and operated by the Northwestern as its collection department.

Too Poor to Pay.

William W. Carlock, Bonners Ferry, Idaho, testified that in October, 1914, while he was at work, J. E. Argo, an agent for the Northwestern General Trading company, induced his wife to sign a contract for one share at $75, on which $10 was paid in cash.

Cheaper merchandise, strictly cash business, no terrors of bankruptcy, direct dealing with manufacturers and buying in carload lots were the inducements used in securing the signature of his wife.

After the stock was bought he learned the Northwestern prices were no lower than he could get at Bonners Ferry, and he then wrote the company a letter agreeing to surrender his payment if released from the note.

"If you knew our circumstances you would release my wife," wrote Carlock. "We are poor homesteaders and not able to go into anything like this. This amount of money means much to us, and if you will release us we will agree to forfeit our claim to the $10 already paid."

Relied on Farmers' Indorsements.

In denying Carlock's plea the Northwestern General Trading company pointed to its recent indorsement by the farmers' union and the Washington State grange. The letter was signed by F. B. Sears, head of the membership department, and was read to the jury. Among other things Sears said:

"This company is on sound footing and is building up very rapidly, and the time is not far distant when it will be the greatest proposition in the United States. There is no question but what it is today the biggest proposition of its kind west of the Mississippi river.

"The executive heads of the farmers' union took a couple of months to investigate the system, books and methods of the company and unanimously indorsed it. The state grange of Washington took the same course. This of itself placed the company above suspicion, and emphatically tells the people that it is right and proper to put their money into it."

Mrs. E. A. Bartlett, Troy, Mont., was visited by two women solicitors for the Northwestern in October, 1911, who assured her that the stock would be a good investment and would pay dividends in a short time. On this representation she bought five shares at $50 a share. Within two hours after she made the purchase she concluded to cut the order down to one share, but was informed that she was late, that the order had gone in by mail to Spokane.

She then wrote to the company with reference to the matter and received a letter from Gale Smith saying that the record showed the purchase by her of five shares of stock for $250, on which she had paid $30 and $220 still remained due.

After lauding the company and its future prospects Gale Smith declined to do anything for her. Mrs. Bartlett testified that she had inquired at the postoffice in her home town and found that no letter had gone out from the women solicitors when they claimed to have mailed her order.

Congratulations After Bankruptcy.

James Denholm of Portland testified that he bought five shares of stock in the Portland branch of the Northwestern Trading company March 21, 1915, at $50 a share, paying $50 cash. On April 6 he received a letter saying that if he paid the balance on his stock that he would be given a discount of 10 per cent and on the 8th he paid it up in full. On April 23 the company went into voluntary bankruptcy, a notice of which he received. On the following day came a letter with his certificate of stock and a note of congratulations.

Illustrating how the same methods were carried on by the Olympic Trading and Supply company of Seattle, a subsidiary of the Northwestern General Trading company and under the same management, Miss Etta Harris, a school teacher of Tacoma, testified in court how women agents induced her to buy five shares of stock, making to her a lot of rosy promises and exhibiting to her a "little brown book" in which the company announced that such a concern had nothing to fear from bankruptcy, and in which a multitude of promises were made.

On the witness stand Miss Harris read extracts from the book, among them the following:

"The sole object of the Olympic Trading and Supply company is to save dollars for the stockholders."

"It will trade direct with the manufacturer and will sell direct to you at wholesale prices."

"It will go into the markets of the world with spot cash."

"Only first-class, standard goods will be handled."

"The profits will be distributed among the stockholders as dividends."

Miss Harris declared that when she dealt with the company at its Seattle store she found none of the promises lived up to; that the stock of goods carried was inadequate and of a character such that she could not purchase what she wanted, and that the prices on the goods that were in stock were no cheaper than the same that could be purchased at Tacoma.

Reading further from the book she had received from the company's woman representative, Miss Harris brought out the following:

"No profit whatsoever will be added for the benefit of any person."

"Officers and employes will draw no big salaries and will not profit otherwise from the business. Not one dollar's worth of goods shall be purchased for this company unless the money is on hand to pay cash prices."

Knock and It Shall Be Opened Unto You

"The advice of the college won't hurt you, for, like the doctor's medicine, you don't have to take it unless you want to."

"The farm home should be built around the kitchen rather than around the parlor."

"When you are tempted to try some of these new, unusual, untried things, before you do it write to the State college for advice."

E. A. Bryan was president of the college at Pullman for over 20 years. He knows more about it than any other person. He saw it grow from its very beginning to its magnificent status today. He saw the college farm developed; saw the experimentation carried on and largely directed it; saw the departments of soil analysis, domestic science, farm crops, architecture, farm mechanics, animal husbandry, poultry, and all the lesser branches created and adapted for farm life betterment, and equipped and manned for that service.

He resigned the presidency of the institution a year or so ago, but his heart is still in its work. He knows exactly what it is and what it can do to assist in the improvement of farms and farm conditions. Next week, in the Washington Farmer, he offers his first article of a series telling exactly and specifically how the man or the woman on the farm can get assistance from the State college.

If the problem is one of farm buildings, farm live stock, farm soils, farm power, kitchen economics, the poultry yard, the crops, the fences, the lighting—

If it is any of the one thousand and one problems that every farmer, young or old, has faced, faces now and will face as long as rural life continues to develop, the college is able and willing and anxious to help. That is its peculiar business. That is what the state and the government support it for.

Dr. Bryan tells you just how to ask for what you may want to know, and declares that the promise is still true: "Knock and it shall be opened unto you."

Read his first article next week. Read the second the following week, and so on—and let the college give you the advice you need.

Marketing Agency
May Be Created by Legislature

As the Farmer predicted recently the creation of a state marketing agency has sprung to the front at Olympia. Several bills to that end are before the legislature, and others will likely follow. In his message Governor Lister treated this question as follows:

"The enactment of a law which will bring about better marketing conditions for those engaged in the different lines of agriculture is a subject which has received a great deal of attention during the last few years. I hope the legislature will give careful attention to such suggestions as the members may make."

It is probable that before the session is ended the friends of state marketing will unite in support of a single measure, and on that issue may be expected one of the liveliest fights of the session, as the plan of making the state the official middleman between the producers and the consumers will be fought with great determination and adroitness by commission men, fruit-handling firms and corporations, grain buyers and dealers in hay and all other farm products.

Artificial Rubber.

Freshly caught sea fish are said to be the principal ingredient of an artificial rubber of Dutch invention.

Value of Field Roots in Northwest

Aim Should Be to Grow the Kind That Grows the Best in the Locality

By THOMAS SHAW

The universal testimony of the farmers of the northwest in answer to the interrogations of the writer has pointed to the possibility of obtaining very large yields of roots. The yields mentioned in some instances, especially west of the Cascade mountains seemed incredulous in a way. The farmers spoke frequently of 25 to 30 tons per acre. In some instances they spoke of 25 tons as an average crop per acre, and these yields applied to rutabagas, mangels and carrots. In one instance a farmer told the writer that he had actually grown 65 tons of mangels to the acre. This was in the Tillamook country and on highly fertilized land. A yield like that may seem incredible to many, but yields of mangels in France point to still higher returns. It is claimed by French writers that more than 70 tons of mangels have been grown on an acre of land. Of course, such yields are in a sense phenomenal, but they point very clearly to the remarkable high adaptation of many parts of the northwest to the growing of these crops.

East of the Cascades they will not produce so highly, except where irrigation can be supplied. But in many areas good crops can be obtained in the absence of irrigation. This is especially true of areas where the rainfall is not less than 20 inches. This frequently happens in many areas in the intermountain states. In some of these the annual precipitation is considerably more than 20 inches. Of course, where irrigation is practiced, splendid crops may be grown, but when in its absence very large yields are talked of by those who have grown them, especially does this hold true of carrots, which may be grown on a less amount of rainfall than some other classes of field roots.

When such large yields of field roots may be obtained in a locality where dairying is the chief line of production followed, it is in a sense surprising that they are not grown by all who are engaged in dairying. That many dairymen do not grow them was made clear to the writer. The reasons given as to why they did not complained of the amount of the work involved in growing them and handling them when grown. But when the very large yields obtained are considered why should this be an objection?

Now, suppose the average yield is put at less than 25 tons. Suppose it is put at 20 tons. Suppose that our bushel, that is 50 pounds, were fed to a cow in milk every day, how long would the roots grown on an acre last that cow? Just 800 days or two years and 70 days. Suppose the cow was given the very liberal allowance of one and a half bushels a day, the roots would last for 533 days, or one year and 168 days. Again suppose the average yield is reduced to 15 tons and that one bushel a day is fed to a cow in milk, the roots grown on the acre would last the cow 600 days, that is one year and 235 days, or practically one and two-thirds years. Now one bushel a day with other fodder would be about as much as the cow would need to cover so long a period, and field roots are excellent for the production of milk. Why then should not the dairymen in the areas under consideration grow large quantities of field roots?

The facts are, however, that many of them do not grow roots. Why is it thus? The answer chiefly given was that they perferred to grow kale. That answer is so far good, but is it all sufficient? Does it not take about as much work to grow kale as to grow field roots? It may be answered that it is less work to feed kale than to feed roots. That is true if the roots have been stored for winter feeding and that would seem to be the best plan of feeding them. But this to some extent is offset by the disagreeable nature of the work of cutting the kale and bringing it in from the field in wet weather, as in the rainy season. Nor can kale be made to cover so long a season as field roots. The plan is good which grows kale for a part of the winter feeding, but would it not be improvement to grow field roots in addition and to store the same where they could be obtained without exposure in wet weather.

The cost of harvesting the roots should not be large, since it would not be necessary to go to the expense of providing underground receptacles to keep back the tendency to grow. They could be easily stored in the field in pits covered with straw and earth. They would even keep in the fields within an inclosure of poles lined with straw. They are thus kept frequently in the climate of Great Britain. One fine thing about field roots is the long time that they may be fed. Mangels especially may be kept under favorable conditions for many months after harvesting.

Which kind or kinds of roots to grow must be determined by the grower. The aim, of course, should be to grow the kind that grows best in the locality. That, of course, may be determined best by actual trial. In one case it will be rutabagas, in another mangels and in yet another carrots. Should they grow equally well, rutabagas will call for less labor than the other classes. Carrots, though a very sure crop, involve more labor, but they have the advantage when preparing them for feeding. Because of their size they do not in many instances call for slicing. When very large rutabagas and mangels are fed to cows they must be prepared by slicing or pulping.

Great use can be made of the carrot. Should soiling food be wanted in the autumn season the carrot can be made to furnish it in fine form. For such a use the half long would probably answer best. The seed may be sown in the usual way and as early as will be prudent. The weeder if judiciously used may be run over the ground before the carrots are up. This should be done in a dry day, and it must not be allowed to go too deeply, or it may harm the carrots. It should destroy many weeds lying near the surface. A skilled man could probably use the weeder by running it crosswise after the carrots are two or three inches high. It the stand of carrots is thick there would probably be more than enough left. But I would not ask any man to do this except in a very small way at first, to know how it will work on his soil. With a small area the garden rake may be thus safely used. I have proved that in my own experience. The cultivator does the rest of the work. Hand thinning is not called for nor hand hoeing, except enough to keep the weeds from making any seed. When the feeding season comes the carrots are pulled by hand from day to day, and fed to the cattle, tops and all. Being half long they may be pulled thus without difficulty. A very large amount of soiling food may be thus obtained per acre. If, however, the carrots are to be stored for winter feeding a larger kind may be grown. Thinning in such a case is absolutely essential.

Eleven Thousand Cattle

Are Assembled at Denver's National Western

By HORACE ADDIS.

The assertion that the 11th annual National Western Live Stock show at Denver January 20-27 was the greatest in the history of the show is believable when it is understood that there were 11,000 head of cattle received in the yards on Monday of show week, some for exhibition purposes, some for sale. There were also hundreds of hogs, horses and sheep. There were 49 cars of registered bulls and 11 cars of heifers shown in the carload lots and this was only a drop in the bucket of the total number offered, for over 2000 bulls in car lots were for sale in the stock pens.

There were just 11 carloads of fat cattle, all 2-year-olds; but there were 20 cars of 2-year-old feeders, 36 of yearlings and 22 of calves. Besides these 89 cars there were 8 of sheep and 38 of hogs. They came from Colorado, Wyoming, New Mexico, Utah, Kansas and Nebraska. Colorado, of course, sent most of them and bought most of the carloads of bulls.

Secretary Johnson informs me that 10 years ago when the show was started there was practically no pure bred stock shown from this region, so two classifications were made, one for the entries west of the eastern Colorado state line and the other open to the world. Now the western men compete in the open class, the western classification is getting to be of less and less importance and eastern breeders actually bought western cattle at the sale to take back home for breeders.

The horse show and the beef cattle show—the latter in both the breeding and fat classes—were the really great features of the show. There were 237 horses in the draft classes, besides nearly 100 in the fancy or "horse show" classes, and probably 50 drafters for sale purposes only. Percherons largely predominated. There were present several winners in the Chicago International. The second prize aged stallion there was first at Denver, but was not made champion. The quality throughout was of the best.

George Chandler and Son of Baker, Ore., showed a carload of yearling Hereford bulls and were able to win first in their class and grand championship on carload. It seemed probable that a few cars of bulls, of all this vast number, would remain unsold at the end of the week, but the Messrs. Chandler sold their car for $575 each. Another notable sale was that of a carload of registered Hereford bull calves under a year old, by the Hereford Corporation of Wyoming of Cheyenne, Wyo., for $300 a head.

The Fat Classes.

The show had both fat and feeder carloads and most of the cars were entered in the feeder class. I was not always able to distinguish a "feeder" from a "fat" carload, except by the big sign which gave the name and address of the owner and the commission firm. There were just 11 carloads of fat cattle, all 2-year-olds; but there were 20 cars of 2-year-old feeders, 36 of yearlings and 22 of calves. Besides these 89 cars there were eight of sheep and 38 of hogs. They came from Colorado, Wyoming, New Mexico, Utah, Kansas and Nebraska. Colorado, of course, sent most of them and bought most of the carloads of bulls.

The Fat Class Sales

There was a fine showing of single fat steers, of Hereford, Shorthorn, Angus and grade, but there were no singles or pens of sheep and very few of hogs. A purebred Angus steer, shown by Congdon & Battles of North Yakima, Wash., won first in this class and grand championship of the breed. He wound up his career by selling in the fat stock auction for $23 a hundred to the Brown Palace hotel of Denver. D. D. Casemont's Hereford steer, champion of that breed, was sold to the same hotel for $25.50 a hundred. The champion Shorthorn steer shown by R. G. Maxwell & Sons of Fort Collins, Col., sold to the Coffin Packing company, Denver, for $20 per hundred.

In the carlots the grand champion load were Herefords. They were shown by Clayton & Murmon of Eaton, Col., and sold for $16. Clayton & Murmon also had the reserve champion carload, also Herefords. They went to the Colorado Packing & Provision company for $12.25. The Portland Feeder company's carlot of Herefords, fed on beet pulp at Burley, Idaho, and for which the Messrs. Burke refused $12 before the show opened and which it seemed to me had a pretty good chance for championship took third place and sold for $11.90.

The grand champion carload of lambs, shown by Bruce G. Eaton of Eaton, Col., took the roof off when they sold to Armour & Co. for $25 a hundred, a record price for the show. The reserve champion lambs, shown by W. W. Brown of Eaton, Col., sold to Swift for $18 and the first prize car of wethers for $15.50.

The grand champion barrow, shown by D. E. Couchmon of Lyons, Neb., sold to the Coffin Packing company for $27 a hundred, another record, and the champion carload, also shown by Mr. Couchmon, sold to the same company for $16.75.

The Beef Breeding Classes.

The Herefords were the most strongly represented in the breeding classes, with 256 entries. It is safe to say there was not a poor animal shown and in most of them quality was very high. When Thomas Mortimer of Madison, Ind., who placed the ribbons, faced the junior yearling bulls, he found 46 animals awaiting place and he found 69 in the junior bull calf class, while 34 junior and 23 senior heifer calves lined up, most of them so good no great mistake would be made if any of them went to the top. Here A. B. Cook of Helena, Mont., was the heaviest winner. He walked off with both senior and both grand championships on his great 2-year-old bull Panama, and his equally great cow Lady Panama 7th, both bred by himself and both carrying great scale and

(Continued on page nine.)

Washington Portraits—No. 1.

E. H. Dunning.

E. H. Dunning of Richland, Wash., has been farming in Benton county two years, growing strawberries, alfalfa, potatoes and operating a small dairy. Dairying is his hobby and he proposes to make this the major line of work, other things secondary. He believes that dairying is the leading way by which the farmer in that section will attain success, as four heavy crops of alfalfa can be grown for roughage and corn for the silo can be grown in abundance. The soil is of a nature, however, that runs down rapidly and consequently needs a good deal of fertilization. He keeps enough hogs to use the skim milk and thus has another source of income without much added expense.

The next in the series of Washington portrait will be that of P. A. McNamara of Sequim, and will be given in the next week's issue of The Washington Farmer.

Board of Five Directors

Later Replaced by Permanent Board of Nine

By N. W. DURHAM

Chairman of Spokane Committee on Federal Land Bank

This is the second article in Mr. Durham's second series on the organization and operation of the new federal farm loan banking system.

Temporarily the federal farm loan banks (including that at Spokane) will be managed by a board of five directors to be appointed by the federal farm loan board at Washington, D. C. But a little later control of the management will pass into the hands of the farmers who are members of the local farm loan associations.

The law directs that after the subscriptions to stock in any federal land bank by national farm loan associations shall have reached the sum of $100,000, the five temporary directors shall be replaced by a board of nine, six of whom shall be chosen by the farm loan associations.

In other words, when the system is going and $2,000,000 has been loaned in the Spokane district of Washington, Oregon, Montana and Idaho, the temporary directors will give way to the permanent.

The six directors elected by and representing the farmers will be known as local directors, and the remaining three will be known as district directors and will be appointed by the federal farm loan board to represent the public interest.

This will be the manner of electing the six local directors:

"At least two months before each election the farm loan commissioner shall notify each national farm loan association in writing that such election is to be held, giving the number of directors to be elected for its district, and requesting each association to nominate one candidate for each director to be elected. Within 10 days of the receipt of such notice each association shall forward its nominations to said farm loan commissioner. Said commissioner shall prepare a list of candidates for local directors consisting of the 20 persons receiving the highest number of votes from national farm loan associations making such nominations.

"At least one month before the election the farm loan commissioner shall mail to each national farm loan association the list of candidates. The directors of each national farm loan association shall cast the vote of said association for as many candidates on said list as there are vacancies to be filled, and shall forward the vote to the farm loan commissioner within 10 days after the list of candidates is received by them. The candidates receiving the highest number of votes shall be elected as local directors. In case of a tie the farm loan commissioner shall determine the choice.

"The federal farm loan board shall designate one of the district directors to serve for three years and to act as chairman of the board of directors." The remaining two district directors will be designated to serve two and one years, respectively; and after the first appointments each district director will be appointed for three years.

"At the first regular meeting of the board of directors of each federal land bank it shall be the duty of the local directors to designate two of the local directors whose term of office shall expire in two years, and two whose term of office shall expire in three years. Thereafter every local director shall hold office for a term of three years."

The purpose of this method is to keep a continuing board, so that all will not go out at the same time. The law further provides that—

"Directors of federal land banks shall have been for at least two years residents of the district for which they are appointed or elected, and at least one district director shall be experienced in practical farming and actually engaged at the time of his appointment in farming operations within the district.

"No director of a federal land bank shall, during his continuance in office, act as an officer, director or employe of any other institution, association or partnership engaged in banking or in the business of making or selling land mortgage loans.

"Directors of federal land banks shall receive, in addition to any compensation otherwise provided, a reasonable allowance for necessary expenses in attending meetings of their respective boards, to be paid by the respective federal land banks. Any compensation that may be provided by boards of directors for federal land banks for directors, officers or employes shall be subject to the approval of the federal farm loan board."

It seems probable that the directors will not be paid, at least not until the system is well built up, any compensation beyond a per diem allowance for time actually given to the business.

(The next article in this series will pertain to the duties and powers of the officers of farm loan associations.)

Large City

Not Best Place for a University

Startling facts brought out before the legislature at Olympia emphasize the objections to locating a state university at a large city. When so located it becomes chiefly an institution maintained by the state, largely by the farmers, for the education of the young men and women of that city.

The official report shows an enrolment at the university of 3435 students, who are residents of Washington, and of these, 2255, a little more than 65 per cent are from King county, which is practically Seattle.

The 1917 report of the state board of finance informs us that for the university the legislature appropriated $1,410,866 at the session of 1915. That was a two-year allowance, so the average annual allowance for the university was $705,433.

King county paid 24 per cent of that, or $169,303 per year. Divide that sum by 2255, the number of students King county had in the university, and you have King county (which is practically Seattle) getting university education for its students at $75 per annum.

Tacoma is in Pierce county and Pierce county adjoins King. But by the same formula of determining education costs Pierce county is paying $284 per annum for each of its 211 students at the Seattle university.

Jefferson, another West Side county, pays $247 for each of its students, while King county pays $75.

Skamania, another West Side county, fronting on the Columbia river, is paying yearly for the upkeep of the state university, $3386. And Skamania had one student there, as shown by the experts' survey!

Spokane county, with 140 students in the university and paying 12 per cent of the state taxes, is taxed $84,651 yearly for the Seattle institution. It is costing Spokane county, therefore, $604 a year for each student it sends to Seattle.

Rural Lyceum

Free Entertainment and Instruction

By Horace Addis.

A free rural lyceum entertainment course is a novel and certainly a most commendable innovation originated at Idaho Falls, Idaho, mainly through the efforts of the commercial club, of which Mr. Bowman is president and Mr. Stubbs, secretary. Through their efforts both literary and musical talent of Idaho Falls were induced to give their services free and excellent entertainment is thereby provided. One hour of entertainment is given and then one hour of an instructive program.

Dr. L. C. Henderson, one of the government veterinarians, who is working on the elimination of hog cholera and is stationed at Idaho Falls, has given the idea his warmest support and he, together with Professor Clarence Johnson, teacher of agriculture in the city high school, have seen that the second hour was filled.

The good roads association has secured R. E. Salzman of Chicago to lecture on good roads. Mr. Salzman is a salaried man. The program rendered at Ririe recently when 150 were present is a sample of what is usually given. Miss Irene Welch Grisson gave a reading, the ladies' quartette rendered "Hail to the Snake River Valley," written by Miss Grisson. D. D. Flenner, son of Judge Flenner, who was famous in Idaho for his James Whitcomb Riley interpretations, gave a Riley reading. Dr. Henderson spoke on "Hog Cholera Control," Professor Johnson on "Live Stock" and R. E. Salzman on "Permanent Roads." The entire program was greatly enjoyed and similar crowds gather at most of the meetings.

Stock Judging

In Mount Vernon High School

To the Editor of The Washington Farmer: The agricultural department of the Mt. Vernon high school is divided into two classes, namely: "First-year class" and "second-year class." The first-year class takes up the study of types and breeds of farm animals, while the advanced class studies soils.

At the beginning of this year both classes took up stock judging in order to be ready for the annual stock judging contest at the county fair, which was held a month after school started. In the judging contest we competed with several of the other high schools of the county.

It was several weeks before we found out who won the judging contest, but when we received the returns all the prizes offered were won by members of the agricultural department of this school. Melbourne Peterson of the advanced class won first prize in judging cows and horses, and James Snowden of the first-year class won second prize. Melbourne received $6 and James $4. These two boys will have the honor to represent Skagit county in the students' stock judging contest at the state fair next fall.

In the pig judging contest Will Schroeder of the first-year class won first prize and received $1.50, and Harold Wersen of the advanced class won second prize and received $1.

After the fair the advanced class organized a club. We named it the Farmers' club of the Mount Vernon high school. We made several rules to follow. The librarian wrote to several papers and magazines. As we have been unable to get books this semester for some reason, we have been taking articles from the different farm papers and discussing them in class.

The club has divided into three groups, each group has a captain, who takes charge of the programs. Each group takes their turn in giving the programs.

The second semester the first-year class will study dairy farming three days a week. The other two days they will test milk. They will take laboratory trips to the different farms and score up the barns. They will visit rural schools and give demonstrations on milk testing in the spring.

The advanced class will experiment in vegetable gardening two days a week and the other three days will study how to make gardens and hotbeds. They will raise vegetables for the markets.

LAWRENCE LARSON.

Mount Vernon, Wash.

Beginning with this issue the Farmer will run a series of phoptographs of representative farmers living throughout the state, giving with each a brief sketch of his interests. Watch for them each week. They are intended to afford a means of getting acquainted with next-county as well as next-door neighbors.

Easy Registration

Is Purpose of Bill in Legislature

Bills are being considered in the legislature at Olympia intended to remove the objection found in the country districts to the present law requiring registration every four years in order to vote. The senate has passed a bill permitting a voter to register at the polling place on general election day, and it is expected that the house of representatives will agree to the measure or amend it so as to make voting itself constitute a reregistration. The bill passed by the senate also provides that the registration books may be signed at other places than the regular registration place, thus enabling the officers to place them at places more convenient for rural residents to register.

Capital Punishment.

Directly as a result of the murder of Chairman E. W. Olson of the industrial insurance commission last week, in the state house at Olympia, a bill has been drawn up restoring capital punishment in this state. It has both friends and enemies, but apparently more of the latter as there appears a strong sentiment against the reestablishment of the death penalty in Washington.

Revolver "Permits."

The legislature is about to abolish the "permit" system of obtaining liquor in the state, and a bill is under consideration requiring that hereafter a person will have to get a permit from the county sheriff or other peace officer before he may purchase a revolver. This law is immediately inspired by the shooting of Commissioner Olson with a revolver just bought, and which still had the price tag on it when taken from his assassin.

Session Is Half Over.

The present session is half over, and it is declared to be in the unusual position of having transacted the most important business of the session. Ordinarily the big measures are left to be disposed of during the last two weeks. Now, however, the constitutional revision question is disposed of by a resolution submitting it to a vote of the people next general election; the educational questions are almost disposed of in the agreement of the university and state college people on a compromise measure which forever establishes the status of the two institutions, leaving the state college practically exactly as it now stands; the liquor question is practically settled, though the senate may force amendments to the "bone dry" bill that has passed the lower house.

Bills Yet Remaining.

There are many measures of considerable importance still on the docket, however, among them the "first aid" bill. The point at issue in this measure is whether the cost of first aid to the injured in the industries of the state shall be borne by the employers or the employes or in part by each. Reports from Olympia indicate that there is a fair chance for agreement on the measure.

The military fund tax levy is also unsettled. There is still a strong effort being made to increase the tax for the militia by from half to three-quarters of a million dollars, making the money available nearer a million than half a million dollars.

The big "omnibus" budget bill which includes all the appropriations for the general maintenance of the state and its institutions is now being drawn up. It is expected that it will be some larger this session than usual.

The public highway funds have not been distributed yet, but it is understood that the legislature will agree to distribute them for eastern Washington in accordance with the recommendations made by the good roads association of that part of the state. There are controversies west of the mountains on the methods of distribution there.

Sells Ranch for $21,000.

Elnora Folsom, widow of the late Myron B. Folsom, has sold her 640-acre ranch near Tonasket, Okanogan county, to B. C. Gregory and W. A. Howard, recent arrivals from Palouse, for $21,000. About 70 cattle, horses and other stock went with the place.

OUR GUARANTEE TO SUBSCRIBERS.

Any subscriber who does not feel that The Washington Farmer is worth to him all and more than the subscription price may order the paper discontinued and the unusued portion of the amount paid for the subscription will be refunded. You must be satisfied.

Entered as second-class matter January 13, 1916, at the postoffice at Spokane, Washington, under the act of March 3, 1879.

GUARANTEE OF ADVERTISEMENTS.

We guarantee every subscriber against loss through dishonesty or swindle by any advertiser in this publication; we do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Complaints must be sent us within 30 days from the date of the transaction, and the subscriber must have mentioned The Washington Farmer when writing the advertiser. This guarantee applies to live stock, except that we will not be responsible for claims for damages on account of disease in stock sold through these columns.

Determining Factors in Agriculture

All agricultural industry must, sooner or later, face the physical geography of the region as the controlling, almost immutable condition. Soil, subsoil, rainfall, temperature, wind currents, length of season, proximity and relation to ocean, rivers, mountain ranges, humidity and aridity, altitude and latitude, are determining factors in agriculture. Here in Washington we range in precipitation from three inches to 10 feet; in altitude from sea level to 15,000 feet above it; in native soil cover, from sagebrush to the densest forests; in soil, from beaver dams to volcanic ash; in season, from long to short.

While the range of conditions is so wide, we must not think that this is without value. In fact, it is one of our great assets. Even in animal husbandry, the variation necessitated by these natural conditions is full of interest and importance. The bunchgrass brakes of the Snake and the Columbia provide winter pasturage for herds of cattle, sheep and horses.

The high mountain areas covered for many months with snow and clothed during the short, hot summer with luxuriant forage form a counterpart for the same classes of live stock. The low, irrigated valleys with abundance of alfalfa and corn, furnish the feed and finishing grounds for meat producing aniamls. The long growing season, humid atmosphere and mild climate of the valleys west of the Cascade present ideal conditions for the abundant pasturage which is the most important foundation for the dairy industry. Climatic and soil conditions in the same region are favorable to the large production of root crops and kale supplementary to pasturage in the dairy industry. Even our brushy undergrowth in certain regions makes possible the Angora goat industry. The omniverous and omnipresent hog finds a reason for his existence in the physical basis which gives to us abundant cereal and forage crops.

The conditions are such as to give us a great range in the size of flock and herds, from the very small on irrigated tracts in central and cleared patches in western Washington, to vast herds on the plains and mountains.

The diversity of physical conditions and natural resources has laid the foundation for a diversified industry, which, in turn, is a good basis for the live stock industry. Washington is one of those states west of the Mississippi river with a larger urban than rural population. The city dwellers, sea-faring folk, fishermen, timbermen, lumbermen, coal and metal miners and railway men, are excellent consumers of eggs, butter, milk and meat, and provide a nearby market of no small consequence.

E. A. BRYAN.

Road Signs Needed

Road associations, county authorities or individuals could scarcely do a greater service from the standpoint of effort required than to put up accurate and informative signs along the roads. It is safe to say that travelers go thousands of miles out of their way during any year in the northwest because there are inadequate signs along the roads.

In California one automobile association has erected at one point a large sign board bearing a road map of the district. It is a capital idea, but it should be supplemented by smaller signs at road intersections wherever they occur bearing directions and distances. But it should be remembered by every association or officer or individual who prepares or places a sign that if it is not true it is worse than useless.

A Smaller Legislature

Senator Cornwell of Walla Walla has a bill at Olympia proposing a constitutional amendment to make the Washington legislature a single body of 15 legislators, who would be paid $3000 salary and hold annual sessions at the state capital.

No more progressive or scientific legislation will come before the Washington legislature this winter. Every one knows that something is radically wrong with present methods of state lawmaking. The fault lies with the system, not with the individual members of our bulky legislature. The system is conducive to confusion, error, extravagance, and the unbearable propagation of needless statutes. A member's constituents expect him to make a "record"—to come back home with a new law or two dangling at his scalp-belt—or at least he thinks they expect it of him and that he must live up to their expectations. With a legislature of 139 members it follows that log-rolling and mutual back-scratching flourish like weeds in June-time.

There is no theory about that; all well-informed people know it for a fact, and none know it better than the legislators themselves.

Senator Cornwell's proposed reform will require amendment of the state constitution, and that puts complete relief well into the future. But meanwhile the legislature need not wait on constitutional revision to give the people a considerable measure of retrenchment. It can cut down the present senate and house by one-half and still comply with the existing constitutional requirements. That would cut the legislative expense bill squarely in two and reduce log-rolling 50 per cent.

Objection that a single legislative body of 15 members would be "undemocratic" springs from imperfect study of principles of government. The converse of that is true. A single chamber legislature, meeting yearly and paid a reasonable salary, would be far more responsive to public demands than is the present system of divided responsibility between house and senate and members paid such trifling compensation that they are often notoriously independent of public sentiment.

Do Your Preparing Early

The tendency to put off till tomorrow what can and should be done today is no greater on the farm than anywhere else. Probably it is not as great. But it is nevertheless true that the plow lays are taken to the shop generally on Saturday when they are to be used to start plowing Monday; that the hay rack is built or repaired between shocking and hauling times; that the harvesting machinery is repaired or newly purchased the last week before the grain is ready to cut, and sometimes after it is ready.

It is not always possible to know many days in advance just what will be needed, or just what one can afford to buy. But as a general rule it can be known, or closely estimated, and preparations should be made as far ahead of time of actual need as possible. If the farm is going to need certain new machinery during the coming season, it is needless to wait until the last week to order it, thereby helping to cause a rush at both factory and railroad office and in all probability delaying the shipment and causing inconvenience and loss to all persons connected with the deal.

Life's Essentials

If you ask the average person what the essentials of life are, the reply will be food, clothing and shelter. These three, we are told, will sustain life.

Well, that depends entirely on what sort of life you mean. If you are referring to physical life, it may endure on these three elements. If you refer to modern, civilized life, other things are just as necessary and important. Men do not live by bread alone.

But without the great trio which actually support human life, all the other things would be in vain, no matter how plentiful they might be. And so there must be food, clothing and shelter that there may be life at all, and those people who supply these things are most important of all. It is on the basis constructed by the people who produce food and clothing and places to live, that all other things are built.

Industrial Wasters of the World

Secretary Redfield of the United States department of commerce says the Americans are the chief wasters of the world.

"It would not be untruthful," he remarked in an address at Philadelphia a few days ago, "to take the initials I. W. W., with which we are familiar, and attach them to ourselves as meaning the Industrial Wasters of the World. We like to be lavish."

Washington Gleanings

Potatoes have been selling at $50 a ton in Tacoma.

D. D. Kelly has sold for $9120 his farm east of Odessa to Simon Roloff, the 240 acres bringing $38 per acre.

Yakima fruit growers cleared $35,000 last year on sale of culled fruit, formerly nearly a total loss to the growers.

It is reported that Northern Pacific officials have set aside $360,000 for improvements in the Yakima valley for 1917.

Construction of a cheese plant at Oakville will be started within the next few weeks by a cooperative company of that district.

George K. Walter of Odessa purchased from N. A. Munro of Everett 640 acres lying several miles northeast of Odessa for $20,000.

The price for hogs on foot has reached $10.20 a hundred at Palouse. The shipments from Palouse will average at least a car a week.

John Leroue of Toppenish has agreed to purchase for a consideration of $15,000 an 80-acre tract six miles from Toppenish on the Fort Simcoe road.

L. E. Ensor of Reardan has sold 40,989 bushels of wheat, mostly marquis, for $61,264.24, or about $1.50 a bushel. This is the largest single sale of wheat ever closed in Reardan.

At the Sunnyside Cooperative Creamery company's annual meeting an increase in the sale of butter of $13,921 over last year was reported. This has been the creamery's best year.

What Others Say.

Southern Agriculturist: The reserve force is what tells.

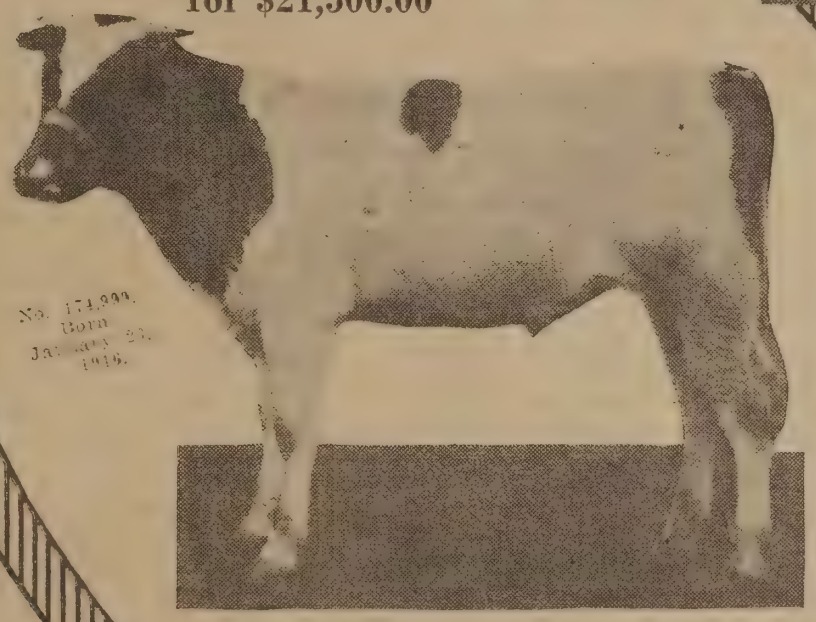
Dakota Farmer: All that too many farmers ask is a gambler's chance.

National Stockman and Farmer: The demand for municipal distribution of milk is steadily growing.

Rural New Yorker: Even the liquor men now seem ready to admit that prohibition is gaining ground.

Hoard's Dairyman: Good farm management largely consists in getting one class of work out of the way of another and in performing each promptly on time.

THE BULL CALF WITH WORLD'S RECORD DAM AND SIRE — 40 LB. LONG DISTANCE COMBINATION



Finderne Mutual Fayne Valdessa, world's highest priced bull calf; sold at public sale for $21,500.00

HIS DAM

Finderne Mutual Fayne

who as a 3-year-old produced almost 37 lbs. butter in one week.

No. 174,999. Born Jan. 29, 1916.

A son of the World's Champion Long-Distance heifer, by the bull with the highest 7-day average. The records of his dam (at 3 yrs.) and sire's two nearest dams average 40.93 lbs. butter.

HIS SIRE

King Valdessa, son of the first 40 lb. cow.

STUDY THE PEDIGREE

DOES A WORLD RECORD MILK BULL AT $800 APPEAL TO YOU?

SIRE

Aaggie Cornucopia Newman, No. 80744.

Whose dam was the world's record milk cow, Margie Newman—Butter 32.79; milk 895.50 (world's milk record when made); milk, 1 day, 136.50 (world's record when made).

One of the greatest young sires of the breed, being the sire of a junior 2-year that holds the world's seven-day milk record; two 2-year-olds who have made over 24 pounds and a 3-year-old who has made over 29 pounds of butter in seven days.

I now offer Colony Zarilda Cornucopia (twin), No. 170835. Born March 26, 1915. Now ready for heavy service. He bears wonderful promise; well boned, square built, more white than black.

Our price is based on present achievement. His value is bound to increase with the development of both his dam and sire, for this young bull's development is only started. Few bulls have ever had such wonderful backing of both milk and butter. READ HIS PEDIGREE.

$800 In Cash Prizes

If young swine are called pigs, what are young rats called?

$800 In Cash Prizes

The above and 59 more questions are to be answered in the big new free-for-all

FARM INFORMATION CONTEST

Could You Use $300?

If you live in Washington, Oregon, Idaho or Montana, you are eligible to compete.

Could You Use $300?

This contest includes 60 questions which every person should be able to answer. If you don't know the answers you should know them, and now is the time to learn. There is a definite answer for every question. Many of them are simple, yet it is not everybody who can answer them right off the reel.

This contest will give every one an opportunity to refresh his memory and at the same time provide interesting entertainment for the readers of the Farmer, besides affording the opening for

Earning Good Sums of Money

We will positively give EIGHT HUNDRED DOLLARS in cash awards (and more in event of ties) to the winners. As explained in the rules which follow, there will be five questions run in every issue of the Farmer for 12 weeks. The last five questions will appear in the issue of April 19.

You Can Enter Without Cost

You do not even have to be a subscriber of the Farmer to enter. As has already been stated, any resident of Washington, Oregon, Idaho or Montana is eligible to compete in this contest.

Five Questions Each Issue

The contest will be composed of 60 questions. Five will be run in each issue of the Farmer for 12 issues.

Answers to each question except No. 45 can be given correctly in from one to 10 words and will be given a score of 100 if correct. Answers to question No. 45 will be limited to 100 words each, and will be graded as to the common sense and general knowledge of farm conditions shown by the contestant without regard to spelling, grammar or penmanship. As with the other 59 questions, a perfect answer to No. 45 will be scored 100.

Perfect Score Is 6,000

The contestant who comes nearest to a score of 6000 and complies with all the conditions of the contest will receive the first prize; the next nearest, second prize, and so on. In case of a tie each tying contestant will receive the full amount of the prize.

There are 35 prizes as follows:

$150 is amount of First Prize.
$100 is amount of Second Prize.
$50 is amount of Third Prize.
$20 is amount of Fourth Prize.
$10 is amount of Fifth Prize.
$5 each, Sixth to Tenth Prizes.
$4 each, Eleventh to Fifteenth Prizes.
$1 each, Sixteenth to Thirty-fifth Prizes.

Read the Rules—Answer These Questions

6. What is the heaviest package which can be sent by parcel post?

7. What domestic fowl requires from 20 to 22 days in which to hatch its eggs?

8. What is the common name for maize?

9. In what year was the edition of the Bible known as the "Vinegar Bible" published? (This question is made simple by our CONTESTANT'S HELPFUL OUTFIT.)

10. What important part of a wagon has the same name as an important part of the human body?

A Valuable Aid to Contestants

One complete CONTESTANT'S HELPFUL OUTFIT, including all of the 60 questions and instructions and helpful warnings as to answers which would be wrong, and the correct answers to some of the most difficult questions, will be sent to any public library free of charge, upon request.

To each contestant who sends in a new, renewal or an extension of his subscription at the time of registering for the contest, this complete CONTESTANT'S HELPFUL OUTFIT will be sent in combination.

We feel that those beginning on the contest will find these suggestions as to what to avoid distinctly useful. This equipment supplies in convenient form everything needed to enable you to apply your ability to the best advantage, and will contain information enabling you to answer the most difficult questions correctly.

Puts Questions in Reach of Children

This CONTESTANT'S HELPFUL OUTFIT puts the solution of the questions in the reach even of the children, it being the purpose to make it possible for everybody in Washington, Oregon, Idaho and Montana to compete. This outfit includes, besides general information about the plan of the contest, the following:

Guide against wrong answers, which includes either correct answers of more difficult questions or easy references as to where to find the correct answers; and blank forms on which to write your answers in such a way that there can be no confusion when your answers are taken up by the judge for scoring.

It will be worth considerable to you to be assured that your answers are reaching the Farm Information Editor in such form that he will know in every instance exactly what question you intended to answer. This CONTESTANT'S HELPFUL OUTFIT will make it possible for you to

Begin Work at Once

On account of the large number certain to send for our CONTESTANT'S HELPFUL OUTFIT, thus making it possible for them to answer the entire 60 questions without delay, it is deemed advisable to offer some special inducements to secure prompt returns from this particular class of contestants. By securing the early replies of those who are thus supplied with the entire 60 questions, we will be able to have their papers carefully scored before the final rush of answers toward the end of the contest.

Understand, it is not absolutely required that those who use our CONTESTANT'S HELPFUL OUTFIT send in their replies at once, but, in order to induce them to get in early, the following plan for enlarging the awards to those prize winners whose answers come in early is offered:

ENLARGED PRIZE LIST—$800 CAN BE WON—ENLARGED PRIZE LIST

For those who use our CONTESTANT'S HELPFUL OUTFIT.

Thirty-Five Prizes	Amt. of prize if winner sends in answers during 1st period, Feb. 1- Feb. 21	Amt. of prize if answers sends in winner during 2d period, Feb. 21 Mch. 14	Amt. of prize if winner sends in answers during 3d period, Mch. 14 April 5	Amt. of prize if winner sends in answers during 4th period, April 5 April 19	Amt. of Prize for winner who does not send in answers before April 19
First Prize	$300.00	$225.00	$200.00	$175.00	$150.00
Second Prize	200.00	175.00	125.00	110.00	100.00
Third Prize	100.00	87.50	62.50	55.00	50.00
Fourth Prize	40.00	35.00	30.00	22.00	20.00
Fifth Prize	20.00	17.50	15.00	11.00	10.00
6th to 10th 5 prizes each	10.00	8.75	7.50	5.50	5.00
11th to 15th 5 prizes each	4.00	3.75	3.00	2.20	2.00
16th to 35th 20 prizes each	3.00	2.50	2.00	1.50	1.00

To secure our CONTESTANT'S HELPFUL OUTFIT, fill out order coupon on this page and send it in to Farm Information Editor, with your personal check, money order or 2-cent stamps, for $1 for one year or $1.50 for three years.

Other Rules

The answers will be passed upon and graded by a fair-minded, thoroughly competent judge.

Two weeks will be allowed for sending in answers after April 19, 1917, date of the issue containing the last five questions.

Remember, your failure to answer all the questions will not necessarily exclude you from the contest. There are 60 questions to be answered and it is not reasonable to suppose that all our prize winners will attain a perfect score. Your answers must all be sent in at the same time. Do not send any answers until you have completed the full list or as many as you can answer.

Those who use our CONTESTANT'S HELPFUL OUTFIT will be able to send in their complete set of answers without delay, there being no need of their waiting for the questions as they appear in The Farmer from week to week down to the final issue of April 19. In order to get as prompt returns as possible from those contestants who use our CONTESTANT'S HELPFUL OUTFIT, extra inducement is made in the prize awards. SEE ENLARGED PRIZE LIST.

Announcement of prize winners will be made and prize checks mailed as soon after close of contest as possible.

If any point is not clear, do not hesitate to write the Farm Information Editor.

All answers must be mailed on or before midnight, May 3, 1917, as shown by postoffice dating stamp on your envelope.

Order Coupon

If your subscription is paid ahead, the time paid for herewith will begin at the date to which you are now paid.

Eleven Thousand Cattle Seen

At National Western Show at Denver, Col., Last Month

(Continued from page four.)

showing wonderful breed type. He also captured several blues in younger classes. George Chandler & Sons of Baker, Ore., also annexed a nice lot of ribbons in the Hereford breeding classes.

The Shorthorns were but little behind the Herefords in numbers, with 220 entries, and were not one whit behind in quality. Frank Brown of Carlton, Ore., was honored with the strenuous task of judging the Shorthorns. He pronounced Maxwalton Roan Lady, the senior and grand champion cow, the greatest Shorthorn cow alive today. She is 5 years old and has calved twice and from her feminine head, along her strong, broad back, down her deep, wide body and well turned rump, the best Shorthorn type is at once apparent. She was bred by Carpenter & Ross of Mansfield, Ohio, and owned and shown by F. A. Gillespie & Sons of North Muskogee, Oklahoma, as was also the grand champion bull, Maxwalton Commander. The fact that Model Type, owned by D. Warnack & Sons of Loveland, Col., that was grand champion at the Portland show, beat 37 other junior yearling bulls and won first in his class, but could get no farther, gives an idea of the quality of the show and the task of placing the ribbons. Forty-nine junior bull calves were placed satisfactorily as were the other big classes shown.

The Aberdeen Angus class brought honor to the state of Washington, Congdon & Battles of North Yakima, with their well-fitted herd of very high quality carried off every blue ribbon, although they had strong competition from Kansas and Nebraska. While Galloways were shown by breeders from Missouri, Kansas and Iowa, the class was small and the individuals of only moderate merit.

The Dairy Cattle.

It was essentially a beef cattle show. This is the third year in which dairy cattle have had a place in the show, yet the exhibit was creditable, even if overshadowed by the other departments. There were three exhibitors each of Holsteins and Jerseys and two of Guernseys, though none had full herds. One small herd of milking Shorthorns was shown. The Jerseys were mainly of Island type and some splendid specimens of the breed were on exhibition. Size and good conformation marked most of the Holstein exhibits. Improvement could be made in the Guernseys shown and the milking Shorthorns were rather plain.

The Hog Show.

The hog show would not be considered large in the northwest, but it seemed to me the quality was equal to that found in the northwest. Perhaps the Berkshire class was the strongest, although both Poland Chinas and Durocs were well represented. There were a few good Hampshires.

The Poultry.

An unusual but pleasing feature was the poultry show, held upstairs above the dairy cattle. It was as complete and well managed and as replete with quality as any other division of the show. Over 1100 birds were shown. Barred Rocks had the largest number, with over 200 birds, Rhode Island Reds next, and then probably White Leghorns, with all the utility and a number of fancy breeds represented.

The Horse Show.

Each night of the week and the last two afternoons a horse show of the fancy classes was staged in the big stadium, in which 10,000 people can be comfortably seated. And it drew the crowds. On some occasions seats for all were not available, so great was the attendance. Horses from Chicago, from Texas and from various places outside as well as inside the state of Colorado, ridden or driven by gaily dressed ladies and gentlemen competed for big prizes, which I would have liked to see added to the utility classes; but they say this is what brings in the revenue, and I have to admit it does. The Denver people want to see the horse show.

Along with the splendid exhibits of breeding cattle from Iowa, Nebraska, Kansas and Ohio were many visitors from the east, but the entire west was well represented, and I met many stockmen I knew. A. B. Cook and George Chandler and his son have already been mentioned. Henry Thiessen of Sweetwater, Idaho, is another Hereford breeder who was an interested visitor. A. H. Barnum of Moro, Ore., was not only there, but took home a very fine bull for which he paid $1650, to head his Hereford herd.

Frank Brown, who judged Shorthorns, was not the only far western Shorthorn breeder. F. M. Rothrock of Spokane spent part of the week there and A. D. Dunn of Wapato was there all week. He and Mr. Brown each bought a bull at the sale, though I think they were buying for some one else and each grabbed a bargain.

I met Professor Carlyle, so long connected with the Idaho university, and now of the Oklahoma college. He judged Angus, Galloways and carlots of cattle. I also had the pleasure of meeting Professor French, late state leader of county agriculturists in Oregon, and for 18 months director of the experiment station at the Colorado agricultural college. J. E. Reynolds of La Grande, Ore., was there. He came to look for a high class Clydesdale stallion to head his very fine herd and was much disappointed to find the breed not represented. R. E. Reynolds, formerly with the animal husbandry department of the Oregon Agricultural college, and now county agriculturist at Cheyenne, Wyo., spent two days at the show.

J. H. Daughtrey, president of the Portland Union Stock Yards company, accompanied by his wife, was a visitor.

John L. Smith, proprietor of the Hazelwood farm, Spokane, Wash., was there to judge all the dairy cattle.

William Hanley of Burns was there and so was Mr. Mayer of Uniontown, Wash. The latter purchased a fine Shire colt from an Illinois firm.

The Hereford sale of breeding cattle was sensational. Fifty head went through the ring in less than three hours, on Thursday, at an average price of $1013. Top price was $5100, paid by the well-known breeder, Thomas Mortimer of Madison, Neb., for A. B. Cook's champion bull, Panama. Another of Mr. Cook's consignments brought $4250. This bull was taken by Professor Kenzer, formerly with the Idaho university, for the Taylor farm in Kentucky.

Chandler & Sons' New Era went for $1650, and was considered a great bargain at the price.

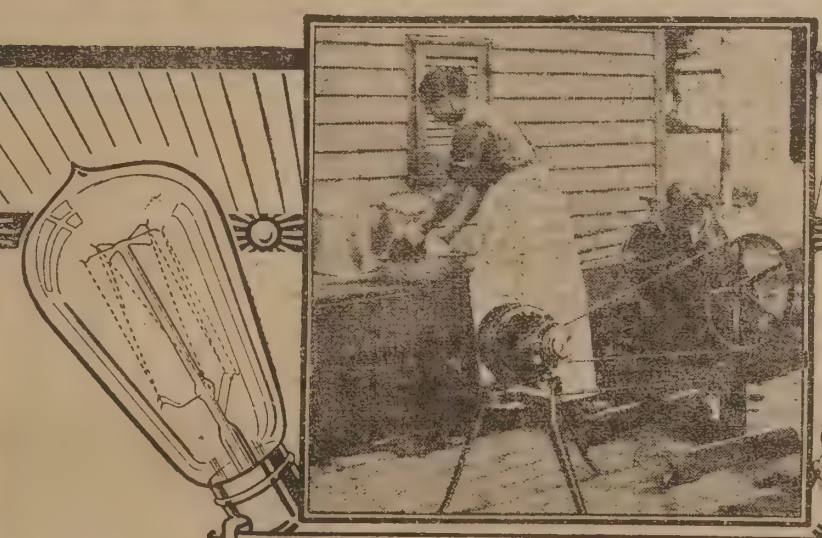
The Shorthorn sale did not show the same high average and top price was $1200, paid by J. R. Carpenter of Cheyenne, Wyo., for College King, a grand roan yearling, consigned by the Allen Cattle company of Colorado Springs, Col. C. A. Hauf of Glendo, Wyo., paid $1050 for Supreme Monarch, a very classy red yearling, consigned by Purdy Bros. of Harris, Missouri. The first 15 sold averaged 691, but a number of very plain bulls were sold toward the close of the sale.

The few Galloways sold were not of special merit and prices brought were moderate.

Raise Telegraph Charges.

Post and telegraph charges have been advanced in Austria in order to raise the interest on the war loans. It is expected in this way to raise $18,270,000 in additional revenue.

BE AN AUTO MECHANIC AND TRACTOR ENGINEER

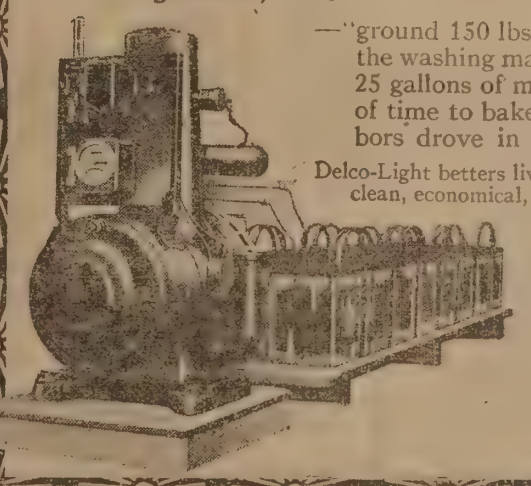


Personal instruction by the best GAS ENGINE INSTRUCTOR in the United States, with TWENTY YEARS' EXPERIENCE. Personal instruction guaranteed. No books, charts or printed lessons used. Practical EXPERIENCE from day you start until you GRADUATE. Our instruction is not mere THEORY, it's getting right down to actual work on REAL AUTOMOBILES and TRACTION ENGINES, on the road, operating field and SHOP. You go through every branch in easy stages. You can not fail to LEARN IT ALL.

Hawthorne Auto School 445 Hawthorne Ave. Portland, Oregon

Established 1907.

There's a good position waiting for the trained man.



DELCO-LIGHT

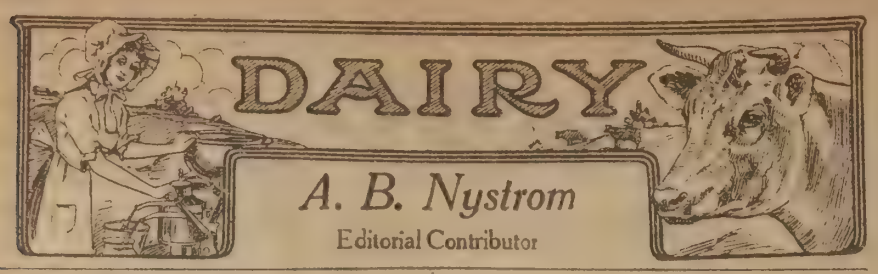
All In The Day's Work

Delco-Light actually pays for itself in time and labor saved in doing the household chores.

Here is a sample day's work for Delco-Light, on the farm of A. L. Denlinger, near Engelwood, Ohio.

—"ground 150 lbs. of sausage meat—churned 90 lbs. of cream—turned the washing machine and wringer for large family wash—separated 25 gallons of milk. And after all of this work, my wife had plenty of time to bake bread. During the evening, some of the neighbors drove in and we had a pleasant time under Delco-Light."

Delco-Light betters living conditions on the farm. It furnishes an abundance of clean, economical, safe light for house and outbuildings. It makes possible a modern bath and running water in various parts of the house, and it furnishes power for small farm machines.



Delco-Light is a complete electric power plant—wonderfully compact, economical and efficient—and so simple that a child can care for it.

Money for Silos

Offered by Bank at Five Per Cent

Showing its faith in the dairy business as an upbuilder of the community, and in the silo as an upbuilder of the dairy business, the Mount Angel bank of Mount Angel, Ore., has announced that it will lend to farmers in the community $5000 at the low rate of interest of 5 per cent on the condition that such money shall be used for building silos.

It is stated that the dairymen are expressing interest in the offer, and as a result a number of new silos are expected to be built.

FARMERS' CREAMERY
Paying Concern for 20 Years.

The Skamokawa Farmers' Creamery association in southwestern Washington is about 20 years old and has been a paying institution from the beginning. The plant is up-to-date and has a comfortable surplus laid up for improvements needed at any time. The officers of the association are: Nels Peterson, president; W. J. Strong, treasurer; W. R. Oatfield, secretary. Peter Jergensen, who was the buttermaker of the creamery last year, has been retained for this year.

From December 1, 1915, to December 1, 1916, there was received a total of 137,461 pounds of butterfat, from which was manufactured 168,332 pounds of butter. The average overrun was 22.45 per cent. A dividend of 1 1-2 cents per pound was paid to all stockholders of the association, and a dividend of 1 cent per pound was given to all patrons who are not stockholders of the creamery.

WILL POOL ALL MILK
With a Special Selling Committee.

The agreement recently drawn up by the Skagit County Dairymen's association in western Washington has been ratified, and hereafter the members of the association will pool their milk and let all selling be done by a specially appointed committee. The conditions of the agreement do not become effective until 6000 cows are signed up, and now 3500 are signed. The association has 297 members, and a vigorous campaign is under way to secure a much larger membersship.

The original idea of the association was to contract with the buyers for all milk from the association at a stipulated price, the same to remain unchanged for three months. The price and other selling terms, however, will be left in the hands of the committee.

Questions

Are Answered by A. B. Nystrom

My cow's milk at times is thick and I can hardly strain it. It also has little lumps in it like butter, and when I wash the milk utensils in soapy water the water gets thick and slimy. I know it can't be from unsanitary conditions because I scald all the utensils and keep everything good and clean. The cow eats heartily and seems to be well; she doesn't cough. She is fed clover and timothy hay, also a warm bran mash twice a day, mixed with a commercial stock tonic. I haven't any idea why the milk should get this way. She will be this way about four or five days and then it will be all right again, but I am afraid to use the milk.

MRS. H. C. M., Spirit.

I would advise that you have the cow tested for tuberculosis. It is possible that she has tuberculosis of the udder. In this case you should by no means use the milk. The milk from any cow with garget should be discarded because it is unfit for food. The garget, however, usually shows up as lumps and stringy matter coming out of the udder at intervals and some times you find congestion in the udder, hard lumps, and more or less caked conditions. Give the cow plenty of exercise as well and I believe that by following out the suggestions given you will get good results.

FEEDING THE HEIFER
For Best Results Later in Life.

I have a heifer which freshened a short time ago. I have been advised that I must feed her heavy on mill feed now if I want her to do her best later on in life, as heavy feeding now will develop milk cells which no amount of feed will bring out of the dormant stage the next time she calves. Is there anything to this theory?

Also please advise me how much shorts per pound of milk it is best to give.

B. E. P., Orchards.

The Answer.

The above question was answered by A. B. Nystrom of the Washington State college as follows: It is the opinion of some dairymen that the method in which the heifer is handled during her first lactation period determines to a large extent her ability as a milk producer for the later lactation periods. This point has not been definitely proven, however, and some dairymen as well as scientists feel that the ability of a cow to produce milk is a thing that is bred into the cow and you can not change that by any method of handling. Our problem in handling any cow, of course, is to get the most out of her that we can at the least expense, and in this connection I wish to state that if a cow is properly fed when she is a heifer and at all times after that, we will get the most out of her. I think that the feeding previous to the time that the cow freshens is of more importance, or at least of just as much importance, as feeding during the time that the cow

Jerseys on a Grays River Farm

Ole Dosland and three of his Jerseys. Mr. Dosland stands farthest to the right. His dairy farm is on Grays River, in southwestern Washington.

Why Let Your Cows Slink Their Calves?

What is Abortion in cows?
A contagious, communicable venereal disease that is costing the breeders of the U. S. millions of dollars yearly.

Can this disease be prevented or overcome?
It can be prevented and overcome.

What do the agricultural colleges say?
Some say it can be prevented and overcome and others say it cannot be.

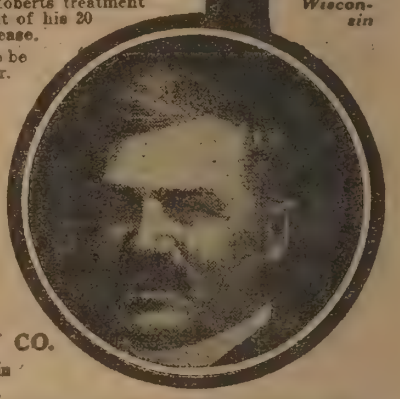
What does the U. S. Government say?
The U. S. Government recommends the hypodermic treatment as the very best method of combating this disease.

Who says that Abortion cannot be prevented and overcome?
People who have not used the Roberts treatment, or who have used only part of the treatment and not according to instructions.

Who says that Contagious Abortion can be prevented and overcome?
The owners of 5,000 herds of cattle who have treated their cattle from one to four times during the past 25 years, owing to the fact that their herds had become reinfected through new animals purchased.

Has this treatment always proved successful?
No; because the directions have not been followed.

Does Dr. Roberts claim that this treatment will wipe Abortion out of any herd regardless of how long it has been afflicted?
Yes, absolutely; providing the cattle are free from tuberculosis and providing directions for treatment are followed.



What evidence is there that this is true?
Animals and herds that were pronounced incurable by veterinarians and owners after having many kinds of abortion treatments given and applied to them have been successfully treated by Dr. Roberts and have been given splendid 7-day and yearly records. Lynden Grove Betsy De Kol, 5 years old—yearly butter record 721.49 lbs. and 18,563 lbs. of milk—is a typical case.

Do agricultural colleges indorse the Roberts treatment?
No; Agricultural Colleges cannot indorse or recommend any commercial treatment for live-stock diseases.

Does the U. S. Government recommend the Roberts treatment?
The U. S. Government cannot indorse any commercial treatment; the Government bulletin, however, embodies all of Dr. Roberts' treatment except these additional values, which are the result of his 20 years' scientific work and personal study of this disease.

If Dr. Roberts can buy infected herds, knowing them to be such, and by his treatment wipe out the disease; if Dr. Roberts can introduce the disease into a herd through infected animals, then check it and wipe it out; if Dr. Roberts can keep his own valuable herds of pure bred cattle free from tuberculosis and contagious abortion, it proves that it can be done. *Dr. David Roberts has done these very things and what he can do you can do if you will do as he tells you to do.*

All Abortion treatments are shipped direct from our laboratories at Waukesha, Wisconsin

There is a Roberts medicine for every animal ailment. Sold by nearly 4000 druggists; if not at yours, write us direct, give your dealer's name. Look for and insist on getting the package bearing Dr. Roberts' picture. Dr. Roberts' great "Practical Home Veterinarian," 184-page cloth-bound book, will be sent you postpaid for $1.00.

is giving milk, and I would say in answer to your question that your cow should be liberally fed now, provided she is over her sickness due to calving, and you should aim to feed what we would call a balanced ration.

We do not consider that shorts is especially fitted for dairy cows. We like bran much better and usually bran can be obtained for from $1 to $2 less per ton. Feed some good, clean hay, usually about as much as the cows will eat up clean without waste, and from three and a half to four pounds of some succulent feed, such as roots or silage for each 100 pounds of live weight, and then feed a well-balanced grain mixture in the proportion of one pound of grain daily for each pound of fat that the cow produces in a week.

SKIM MILK CHEESE

Fat Is Replaced by Water.

Please give me what information you can on how to make skim milk cheese.

W. O. P., New Castle.

The Answer.

Professor A. B. Nystrom gives the following method of making cheese from skim milk:

I regret that there is very little published on the subject of making cheese from skimmed milk, and so far as I know there is no method by which we can make a cheese from skimmed milk equal to a full-cream cheese. Where skim milk cheese is made, the fat is replaced by water to a certain extent, and in this way a fairly good cheese can be made. Skim milk is heated to about 84 degrees Fahrenheit and ripened to .24 per cent acid by the addition of starter. When the proper degree is reached four ounces of rennet per 1000 pounds of water is added and thoroughly stirred into the milk for three minutes. The curd is cut as soon as it is firm and afterward stirred gently for five minutes or until the curd particles have commenced to contract. The whey is removed quickly and the curd plied, without stirring, at least 12 inches deep in one end of the vat. The whey running from the curd should test not over .22 per cent acid. As soon as the curd becomes firmly matter it is cut into large pieces and turned, and in 15 minutes it is ready for milling. After milling it is rinsed off with pure cold water and salted one and one-fourth pounds to each 100 pounds of curd. From this point on it is finished the same as full-milk cheese. Skim-milk cheese will shrink rapidly if it is not paraffined, and it is, therefore, advisable to apply paraffin when the cheese is three to four days old. When ripened at a temperature of 70 degrees Fahrenheit the cheese is ready for the market in about 30 to 40 days.

SLIMY SUBSTANCE

Gathers in Bowl of Separator.

I have a Jersey cow which came fresh last August, whose milk is apparently all right, but when put through the separator there is a slimy substance in the top of the bowl of a grayish mucuous matter. The cow is a good eater and seems healthy, but her manure is a little hard and has a little filmy coating sometimes. Can you tell me what the trouble is, and a remedy for it?

U. S. A., White Bluffs.

The Answer.

Referring to the above question, A. B. Nystrom, professor of dairy husbandry at the Washington State college, says:

The appearance of a slimy substance in the milk bowl after separating is a normal condition. We find this mucous matter present in practically all milk. Of course, some cows give more of this than others and that is probably due to the fact that there is a better circulation in the udder so that the refuse matter is taken care of; but I do not believe that you need to be alarmed over the condition that exists. The cow should have plenty of exercise, and if the milk itself shows slimy and abnormal before you separate it, I would suggest that you massage the udder regularly for 10 or 15 minutes each day to bring blood to the parts, in this way increasing the circulation.

PRIDE OF LILAC HEDGE.

Handsome is as hondsome does. Lilac Hedge Pride is handsome only because she is a producer. According to the live stock department of the First National bank of St. Paul, she produced 130 pounds of butter in 30 days, not a world record by any means, but a notable product. She is a grade Holstein of North Dakota.

SHARPLES

SUCTION-FEED PATENT

and what it means to you dairymen

The new SHARPLES patent, one of the broadest process patents ever obtained, covers any separator that will ***skim clean at all speeds.*** It covers the ***process*** of varying the feed in proportion to the centrifugal (separating) force. No one else can, for 17 years, make and sell such a separator.

You know of the tremendous losses caused by all fixed-feed separators because they are never turned full speed. More than 4,000 investigations ***proved*** that 19 out of 20 operators turn their separators ***below*** speed most of the time. Purdue Experiment Station Bulletin No. 116 ***proves*** that the loss from slow turning amounts to from 7 to 13 lbs. of butter per cow per year—or the appalling loss of 80,000,000 lbs. of butter yearly in America alone!

Skims Clean at *Any* Speed

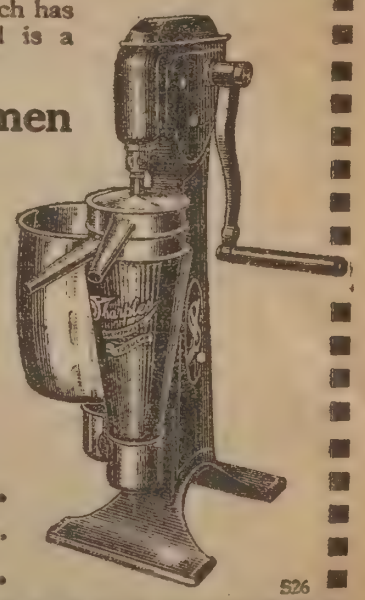
So we realized that it was far from sufficient that a separator ***could*** skim clean when properly handled. It was vitally necessary that it ***would*** skim clean—even when improperly handled. That's SHARPLES, which sucks in just as much milk as the centrifugal force can perfectly handle—and ***no more.*** The result is ***clean*** skim at all speeds and ***unchanging*** thickness of cream.

All separator makers ***know*** of this tremendous loss and some ***admit*** it in their advertisements. They ***cannot*** stop the loss (because SHARPLES basic patent covers any separator that will skim clean at all speeds) so they try to ***warn*** against it by putting on a sight speed indicator (on which the operator's eyes must be glued every moment and his muscle must respond instantly to the indicator's ***prod*** for more speed)—or a bell indicator (which, like the fire alarm, gives notice of damage only ***after*** it is done). All such devices have proven ***failures,*** time after time, because few operators can stand being prodded or yelled at whenever the speed slackens.

A bell ringing device is truly an acknowledgement of the vast ***superiority*** of SHARPLES which automatically ***prevents*** all losses from uneven turning instead of simply announcing them.

Simple Tubular Bowl—*No Discs*

Not a single piece is added to accomplish the wonderful "Suction-feed." And the SHARPLES was ***already*** by far the ***simplest*** and easiest to clean. We realized that it was not enough that a separator ***could*** be kept clean—it must be so simple that it ***would*** be kept clean. So the ***patented*** SHARPLES Tubular Bowl contains ***no discs*** or blades—it is just a plain, light, steel tube. No other separator can use it.



All other separators must contain discs or blades to skim at all. Their makers wrangle between them as to how many discs, and if curved or straight, and how the milk should be fed into them. They constantly change their designs without getting nearer the ***ideal.*** Some use more discs, many of them boast of using less. Such boasts plainly acknowledge that "the fewer discs the better."

The ***ideal*** is SHARPLES which has ***no discs at all.*** But this ideal is a SHARPLES patent.

Important to Dairymen

So all SHARPLES patents assure ***you,*** as a SHARPLES user, of ***larger*** profits and ***greater*** convenience than the other man gets. The knee-low supply tank, single ball bearing in oil, slow and easy crank speed, freedom from the tyranny of fixed speed, increasable capacity, easiest cleaning, automatic oiling without oil cups or oil holes—all these are ***your*** advantages ***exclusively,*** because they are exclusive SHARPLES features.

Send for catalog, which explains all this, addressing Dept. 49.

Veal Animals

How to Dress for the Market

"Calves must not be under six weeks or more than eight weeks old, weighing from 85 to 150 pounds, says William H. Plath, meat cutter at the Greenough-Hurley company of Spokane.

First cut head off, by doing so it is not necessary to stick the calf. Cut forelegs off below the knee cap, hind legs at first joint below hocks. Hang up, cut open full length from tail all the way down through throat. By doing so it is not apt to sour or spoil during hot weather. Many a fine veal has spoiled during hot weather because of not being opened properly. Take entrails out, leave the liver and kidneys in, and by being careful in removing the entrails it is not necessary to wash calf, but take a damp or dry cloth, depending upon the condition, to wipe it.

Don't ship until the animal heat is entirely out of the body. It is very essential that the directions for dressing the calves be followed, especially in letting the calves cool properly before shipping in hot weather, as 25 per cent of calves are received in bad order and sold for not more than charges, and some do not bring that. They should hang up from six to eight hours over night in an airy place to properly cool off before shipping. Calves under 75 pounds should not be shipped, and are liable to be comdemned by health officers as being unfit for food. Merchants, too, are liable to be fined if found selling these slunks, for violation of the law.

"Very heavy calves, such as have been fed on butter milk never sell well on the market. They are neither veal nor beef.

"Directions for shipping veal: Be sure to burlap calves. Fasten shipping tag, with your name and postoffice address or shipping point written plainly thereon, to the hind leg. Never ship calves to arrive here on Saturday as that is a very busy day to receive them."

HALF BUFFALO

Two Carloads From Montana.

Two carloads of cattle from Montana, unloaded at the Northern Pacific stockyards at Ellensburg, Wash., were half buffalo. The animals showed little evidence of their close relation with the bison except that they were heavier in the shoulders than the ordinary beef animal. They were bred on the ranch of a Montanan who has been experimenting for several years to develop an ideal type of beef cattle.

More Colville Sheep.

There were 5000 more sheep in the Colville valley last fall than a year ago, according to George W. Peddycord, president of the Bank of Colville.

Veterinary

Dr. S. B. Nelson

I have a cow with sore teats. The sores commence with a lump the size of a pea on the side of a teat. In a day or two they will grow to half the size of a dime and resemble a blister and contain a thin yellowish fluid. The blister breaks open ad leaves a raw sore which in time scabs over and festers and in time heals up, but before it has healed other sores have started on other teats. This has continued for four months now and the sores are still coming. It takes about two weeks for a sore to heal after it first appears. What is the disease and how can it be cured? H. H. C.
Chehalis, Wash.

The description which you give of the disease affecting the cow's teats and udder tallies very closely with the symptoms of cow pox, which I believe the disease to be. The run of the disease is about three weeks, and the fact that your cow has suffered for more than four months is something very unusual. I am going to recommend that you wash the udder and teats before and after milking with a 2 per cent solution of lysol, then apply a little benzonated zinc oxide ointment to the scabs and blisters. I think you will find that that will help in healing up the trouble. Milk this diseased cow last after all the others have been milked. Wash your hands or have the milker's hands washed in a 2 per cent solution of creolin before and after milking.

1. M argued that Shorthorn cattle are not Shorthorn Durhams. B argued that they are. Who is right? 2. What care and feed should a stud coming three have and how many mares should he serve per week? B. A. B.
Springdale, Wash.

1—Shorthorn is the accepted name now for the type of cattle that used to be called Shorthorns and in some sections called Durhams. The word "Durham" has become obsolete.

2—Regarding the care of your stallion, I would suggest that you give him a good feed of oats and hay, possibly about 10 to 14 or 15 pounds of grain per day, and, according to his size, from 12 to 18 pounds of hay. This also depends upon his exercise. He should have from five to eight miles of exercise per day. Among the stockmen, that is, horsemen, if they are trying to save the horse for a long life of future service, they generally try to limit him during his first year to two or three mares per week.

What is the cause and cure for the swelling just back of the upper front teeth of a horse, known as lampers? I have two colts coming 3 years old that have them, and it bothers them to eat. Have been feeding oat hay and corn fodder. D. H. S.
Camas, Wash.

The trouble generally known as lampers in horses is an irritation of the teeth of a young horse. Second, indigestion which generally occurs in older horses. As you have two colts coming 3 years old I would judge that

In answering advertisements don't fail to mention this paper.

the trouble is due to their cutting their teeth and I would advise you to make a strong solution of alum and with a little cloth or cotton, once or twice daily, apply the alum solution to the membrane just back of the teeth. Do not cut or burn them. It is not necessary.

I have a 12-year-old mare that has had the scours nearly all winter. She gets straw and good wheat hay night and morning and I let her run in the day to straw. She gets all the salt and water she wants and has not been worked this winter. I also have a yearling colt that acts the same way. He gets the same feed as the mare and they eat good and seem to feel good. The straw is nice and bright.

A. G. B.

Baird, Wash.

Your horses are getting too much roughage. I would advise that you cut down on your straw and grain hay and feed a little grain, if you can get it --a little alfalfa or clover hay. Then give to them in their drinking water a teaspoonful of glycerin morning, noon and night for a few days, then twice a day, then once a day for a few days. This has given good results in many cases.

I have a cow that lost her calf last summer at six months. Although I think it was from accident, I treated her with Hood's Farm Breeding powder, also gave her internally (once) one tablespoonful of saltpeter and injected (once) one-half ounce permanganate of potash and one ounce of alum in half gallon of warm water. Ever since, during milking, she has given a lot of trouble by attempting to urinate, not often with success. Can I do anything for this? J. R. W.

Olympia, Wash.

Try giving your cow one teaspoonful of Eugals solution of idine in a pint of water morning and evening. Take her off grain, if she is on grain, for a few days, and then gradually put her back on her grain ration.

I have a bunch of heifers on pasture. Last fall there was a scab formed around their eyes and the hair came off. This is now spreading over their bodies. I have tried sulphur and lard, but the disease continues to spread. What is the disease, its cause and treatment for same? J. J. S.

Bryant, Wash.

Try painting the diseased part of the skin with a 4 per cent solution of silver nitrate and, while the skin is damp, apply on top of the silver nitrate tincture of iodine. It may be necessary to give them from two to five treatments.

My cow has been giving bitter milk for about three months. After it stands 24 hours it is so bitter you can not make butter or use the cream. Have been feeding oat hay, alfalfa and carrots. It seems to hurt her in milking until after the flow of milk is started. She is free from any sore in the teats. She eats well and drinks plenty of water. L. M. D.

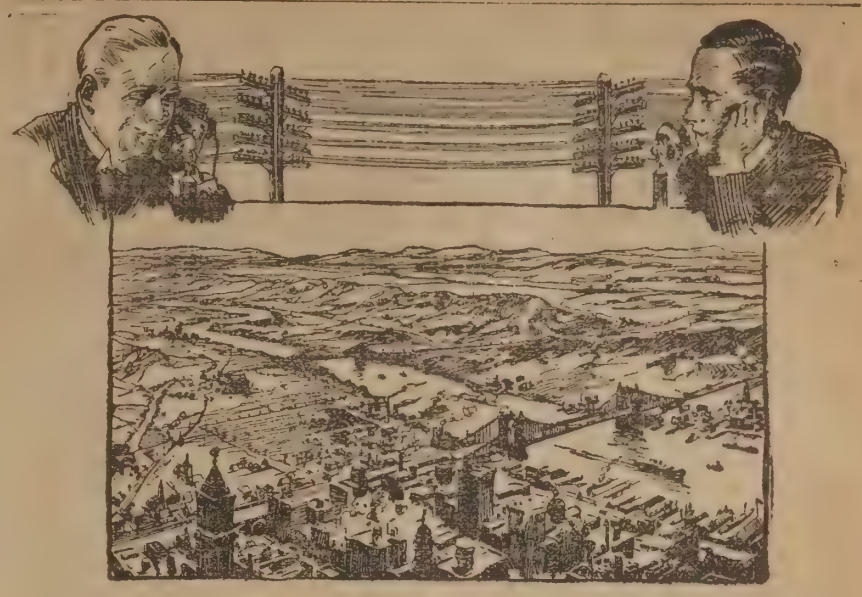
Pullman, Wash.

Try feeding your cow a pound and a half or two pounds of epsom salts in three quarts of water. If necessary give her a teaspoonful of hyposulphite of soda in one pint of water once daily.

What causes a cow to have red water? J. B.

Blaine, Wash.

The cause of red water in cows is not known. Up to the present time a permanent sure cure has not been found. The experiment station veterinarian of the station at Pullman, Wash., has been working on this question for some years. He has found a great many things concerning the nature of the disease, but regarding the things you ask I believe there is no definite knowledge determined yet.



I have a cow that has warts on her udder and back. What can I do for her? C. G.

Wilbur, Wash.

I would advise painting the warts with American oil once or twice daily and then give the cow, internally, one-half ounce of Fowler's solution of arsenic. It may be that you should not use the milk during the time that you are giving the arsenic, and also for a few days afterward. You can feed the milk to pigs or calves, and I do not think it would do any damage.

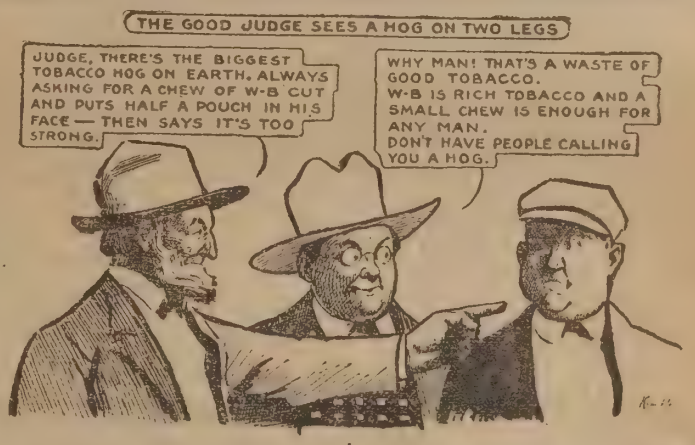
Happiness.

Happiness comes from striving, doing, loving, achieving, economizing, always something pasitive and forceful.—David Starr Jordan.

A Bee-Line to Everyone

Straight as the bee flies and quick as though caught by lightning the voice in the telephone carries near and far over this Nation.

This marvelous instrument is the pre-eminent vehicle of speed and speech. Railroads cover the country, but your traveler often must alight with bag and baggage and change trains to get to a given point. Railroads reach cities, towns and villages. The telephone reaches the individual.



The telephone offers continuous passage for the voice and unbroken connections to the uttermost places because it is a united System co-ordinated to the single idea of serving the entire people of this country.

It has been a powerful factor, along with the transportation systems, in the magnificent achievements of the United States—helping to prepare the way where latent possibilities of mines, forests and farms were to be developed.

The continued growth of our national prosperity depends in a great measure upon the maintenance and continued growth of the utilities which furnish the means of intercourse and interchange. They are the indispensable servants of the individual, the community and the entire nation.

James Dryden
Editorial Contributor

If not already done, kill off all pullets 9 months old or more that have not laid, if other pullets of the same age and breed in the same flock laid at 6 and 7 months of age. These nonlayers will not lay much the rest of the year.

Now is the time to be figuring on the profits in egg production next winter by doing a lot of figuring now in the mating up of the breeding stock. Mate good layers to sons of good layers.

Line breeding or inbreeding for egg production for egg layers is a dangerous weapon; better not fool with it.

Profit-making pullets next fall and winter must be hatched in March or April.

Oregon poultrymen who wish to assure themselves against the ravages of bacillary white diarrhea in the chicks should have their breeding hens tested by C. C. Lamb of the poultry department of the Oregon Agricultural college, then kill off any hens that prove to be infected. It is easily done and worth while. J. W.

Poultry Results

He Wants to Get Hatchable Eggs

To the Editor: I have been raising chickens now for about five years, but have never felt that I was getting what I should out of them, and will appreciate it very much if you will advise me how I can improve on my weakest point, i. e., getting hatchable eggs and livable chicks.

By way of explanation, will state that my birds are kept in open front houses and in seasonable weather have the run of about an acre of orchard. They have all the variety of feed and exercise that I can give them, oyster shell, grit and meat scraps, deep litter to scratch in, and, in fact, seem perfectly healthy and are fairly good layers.

Have plenty of cockerels and have no complaint to make on infertile eggs, but I get too small a per cent of chicks out of the incubator and from under the hens.

I keep the male birds, the young pullets and half a dozen breeding hens in a house by themselves, and all the balance in another building, about 29x30 feet, and go after them for the eggs, and have to use eggs from these birds for hatching purposes. Always sell the hens in the summer after they are two years old, and keep about 50 pullets and 50 hens in the one building.

Now, the point I don't understand is, if I weaken them through the winter by their laying, how do the 200 eggers perpetuate themselves? We wouldn't know a hen was a high producer until she produces, and these eggs are hatched, or at least advertised and sold at a high price for hatching purposes. Still I do not know that my birds are laying enough eggs to affect their vitality for spring hatching eggs, as they are now turning out about nine dozen per week for the hundred; of course the pullets are doing most of the laying now.

Dr. Woods is a strong advocate of giving the breeders a good rest before using their eggs, but most of us are not fixed with buildings to have so many flocks.

I always keep half a dozen hens, from a separte strain I bought, and a cock that I buy from the outside in this building spoken of in the winter, and give them the run of my garden in the spring. From these I raise my cocks for the main flock.

I have some good birds—White Wyandottes—and they are making me a little money, but the losses I have make them cost me too much.

J. H. YEARSLEY.

Caldwell, Idaho.

Some important points are raised by Mr. Yearsley in his letter. The letter does not indicate anything particularly at fault in the management of the flock. However, there may be something not explained in the letter that would account for the poor results. I understand he uses 50 hens and 50 pullets as his breeding stock. This would be all right if the pullets were fully mature and laying full-sized eggs. Immature pullets should not be used as breeders. The males should also be fully matured, preferably a year old or more.

The main point in getting good, hatchable eggs and good, vigorous chicks is to first get vigor in the breeding stock, both in the males and females. The lack of vigor, however, is not always apparent. The hen as well as the male may apparently have good vigor and the hen may lay well, but may not transmit the vigor to the chick. Usually, however, one can tell by looking at the hens or by handling them whether they are in good breeding condition. The signs of vigor are a fully developed red comb, bright eyes, good condition of flesh, smooth plummage, and active disposition. The singing, active, scratching hen is usually in good vigor. Another good sign of vigor is that the hens are always ready for their meals at feeding time.

But all those signs may be present and yet in some cases there will be poor hatches and high mortality or slow growth in the chicks. This may be caused by inbreeding or other causes.

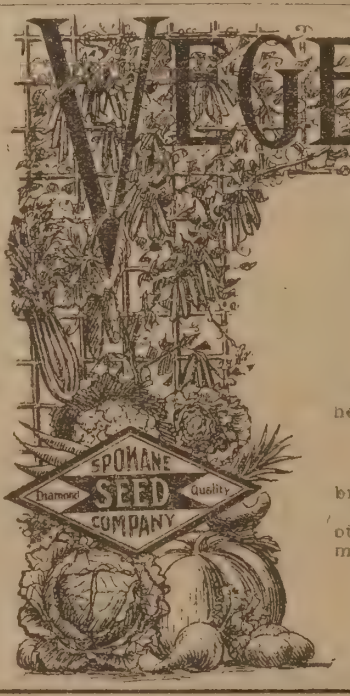
Male Half the Flock.

But the object is to get good vigor in the breeding stock in order to get vigorous chicks. Particular attention should be paid to the male, as he is half the flock. Vigor depends very largely on the feeding. Good hatchable eggs is a question largely of nutrition. Usually if the hens lay well they will lay good, hatchable eggs, but not always. The feeds may do for the production of eggs, but there may be something lacking in them necessary for the proper embryonic development of the chick. What that is it is hard to say. But there should be a sufficient variety of feed. A hen on a free range usually lays good hatchable eggs and it is no doubt because they find some food that is necessary but may be lacking in the ration fed.

In regard to feeds, Mr. Yearsley says nothing about green food. A plentiful supply of green food is one of the most essential things for breeding stock. They should have green food all the time and all they can eat all the time. Kale, cabbages, mangels, sugar beets, steamed alfalfa meal or leaves, or better green alfalfa or clover. If possible, vary the green food a little, that is, give more than one kind at a time. Do not change, for instance, from kale to beets all at once, because it will be several days before they will learn to eat the beets, and meantime they have suffered for lack of green food.

A little fresh meat scraps, or cut bones, in addition to the dried meat scrap, is good. Milk is also good. Oyster shell and grit are also necessary.

Keep Hens Busy.



But whatever ration is fed, it should be fed in such a way as to keep the hens busy most of the time. Feed all the grain in a deep litter of straw. Give them all the range possible. This furnishes exercise and probably some feed that the ration lacks.

It is a very good plan to check up the incubator with sitting hens. Set several good setting hens with the same kind of eggs and at the same time as the incubator is set. If a good setting hen hatches a large percentage of the eggs and raises good chicks, then the eggs are all right and the breeding stock is all right. But they should be hens that attend to their business properly. It should never be taken for granted that the incubator is doing good work, because it is often not doing good work and the poultryman doesn't know it. It may hatch the chicks, but may not hatch them right. So check the machine with a good setting hen or two.

Are 200-Egg Hens Good Breeders?

Hens that are in good, vigorous condition, ready for their meals, laying eggs of normal size and shape, will be good breeders whether they lay 100 or 200 eggs in a year. I have had 300-egg hens that were good breeders. No

MICA AXLE GREASE

stimulating condiments, however, should be fed to increase production, such as red pepper. High fertility and good vigor in the chicks does not depend upon low production in the hen. The reverse—poor laying—sometimes indicates poor breeding condition, such as overfatness. Again, hens affected with baccillary white diarrhea are not heavy layers. Year-old hens have rested their reproductive organs during the molting period and when they begin to lay they are in good condition for breeding. That is all the rest they need. Not many years ago an eastern poultry writer made the statement that no one ever produced a hen with a record of 225 eggs that produced a daughter equaling her record. I have bred dozens, perhaps hundreds or more, daughters of hens laying 225 eggs or more that laid from 225 to 309 eggs. Nearly all the high-record hens at the Oregon station have been bred from 200-egg hens. J. D.

Use of Alcohol

As Fuel for Power Is Possible

Friends of prohibition at Olympia and other western capitals are giving much attention to practical methods of further restricting the sale of alcohol. Experience has shown that a good deal of drunkenness in prohibition states is traceable to the alcohol loopholes in the law, and the problem is one of growing difficulty by reason of the increasing industrial use of that product.

With ultimate exhaustion of the country's upply of gasoline, and advancing prices already upon consumers, attention will turn more and more to the substitution of alcohol for power purposes. A writer in the Rural New Yorker discusses this subject in an interesting and instructive manner. He says:

"As a gas fuel, alcohol is not as good as gasoline in theory; it is already one-sixth burned up, but, mixed with air, it can be more compressed before it explodes from the heat of compression, and this tends to equalize them. As a quick heater, alcohol has no equal; it is safe and odorless. In its most recent solidified form it is also cheap, since there is no loss when not burning.

"The munitions makers use alcohol and its derivatives, ether and acetone, and their demands have forced the price rather high. This condition will not last, and meanwhile the prohibition of alcohol as a drink—or 'food,' if you wish; it is going to be prohibited, anyhow—makes available a number of going concerns which can as well produce denatured alcohol.

"Mr. Ford has announced that the breweries of Michigan can made denatured alcohol for his tractors at a profit. He may solve the problem of a good alcohol motor; it is already near solution; but cheap alcohol from farm waste, which is also receiving his attention, is a harder problem. It can be solved, if he is willing to pay the price, but the price will surprise Mr. Ford. There is an idea that farmers were misled in respect to cheap alcohol, but the only trouble was that the law was 20 years ahead of its time. Any farmer who has or can buy the waste, and has the outfit and the knowledge, can make denatured alcohol. Lots of them have the waste, cheap and efficient outfits will come on demand, but the skill to manage a few hundred billion yeast cells so as to make them work at a profit is rather more than is required to make a profit out of 50 cows. But it is not unattainable.

"Another waste which is getting a lot of attention is the waste liquors from the wood-pulp industry. They grind up a lot of wood in these mills every day, and a good half of it goes into solution, and this solution is fermentable, but getting yeast cells to live and work in this sulphite waste is no easy matter. There are those who claim they are doing it, however, and others are taking any sort of waste wood and cooking it with acid till they get a fermentable liquid. But they have their troubles also. Materials which are starchy or sugary in their natural state are, after all, the best food for the yeast cell, and these are wasted every year by the ton. When we have learned, by Mr. Ford's help or otherwise, to use these, there will be cheap fuel for all the motors. But, like pasteurizing milk, while any one can make alcohol, it will be most cheaply made at central cooperative plants, and their establishment probably will be the ultimate solution of the problem involved in the production of industrial alcohol."

NEED GRAIN CARS

Shortage Delays Shipments:

To the Editor of The Farmer: The Mohler Warehouse company has been busy buying wheat and handling coal and wood. Last year they handled over 200,000 bushels of grain. Other warehouses are handling large amounts also. From $1 to $1.56 is the price received for wheat. There is close to 200 cars of wheat yet in Mohler because of the shortage in cars. There has not been a car here in from two to three weeks and I hear that they may have to ship on flat cars, because of the shipping of ice, which is starting now. The ground is now frozen very hard. Some of the ranchers are offering $45 per month for farm help, which they will soon need.

"If We Knew How"

And We Will Know Sometime

By GRANVILLE LOWTHER.

If we only knew that when we grow poor varieties of fruit and put them on the markets we were diminishing our own profits, we would not grow them. Not long since I stopped off at a town in Oklahoma. In the depot there was a fruit stand in which there were on sale bananas, oranges, raisins, figs, apples and "western boxed apples." I saw a fine looking box of Ganoes, and while I knew the apple was not first class, I thought I would buy one and taste it. It was all right for a Gano, but no one would likely prefer it to an orange if he knew what he was buying; nor would he likely buy at another time one of our better varieties unless he were acquainted with the varieties by name and the difference in quality.

If we knew how to get together, so that in marketing our fruits we would not compete with ourselves to see who could quote the lowest prices, we would eliminate the waste of competition with ourselves, cheapen the cost of marketing and also get better prices. These facts, taken together, would greatly increase our profits. We will do it some day; in fact, we have made some advancement in that direction, but there is still much to be done.

If we knew how to produce the greatest amount of marketable fruit with the least amount of labor, we would by that means cheapen the cost of production and therefore increase our profits. This is done by the use of improved machinery that multiplies labor power; and by the proper adjustment of the laborers so that one group balances another.

If we knew that we could grow in this country a splendid quality of tobacco for spraying purposes, we would not only introduce a new industry into our orchard sections but would greatly cheapen the cost of spray materials.

If we only knew how to utilize our waste products at a profit or even if we knew how to make them pay the cost of production, so that they would not draw from the profit side of the account, we would be far ahead of where we are in the science of the fruit industry.

If we knew how to adapt our varieties to the soil, climate and altitude, we would grow better fruit. For instance, the keeping qualities of the Jonathan are better, if it is grown in the higher altitudes, and there is at least a month's difference between the ripening of apples grown in the lower Yakima valley, for instance, as compared with the same varieties grown in the orchard sections of the same valley nearest the mountains or in the higher altitudes.

We are learning; little by little, we gather experiences that cost us severely, but it is the only way we can get the information. We are as pioneers adapting the fruit industry to new conditions in a new country. Our experiences will become matters of record for the guidance of those who will come after us, and they will not repeat our mistakes. They will make others, for each and every generation has its own problems to meet, but they will avoid ours. Thus the knowledge of the race of mankind is cumulative; each and every generation adding something to the sum total of knowledge. For this reason each and every succeeding generation has a richer heritage than the one that preceded it.

The Central Packing House

S. V. Beckwith of the Rogue River Fruit and Produce association, in a paper before the apple conference claimed that the operation of the cetnral packing house in a community was a great help to the growers.

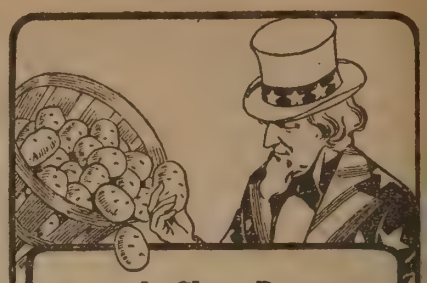
This is the ninth and last of the series of articles in the Farmer summarizing the addresses and the discussions of orchard problems as heard at the apple conference held in connection with the apple show at Spokane last November.

Essentially a co-operative idea, the central packing plant for an orchard community was declared by S. V. Beckwith of the Rogue River Fruit and Produce association to be one of the greatest aids to the grower in handling his product cheaply and properly. The following is his paper, in part, as read before the orchardists attending the apple conference at Spokane:

"I think the Rogue River Fruit and Produce association is a pioneer in the centralization of packing idea. We started it three years ago, hauling a good deal of the fruit to the central packing house at Medford; the following year we hauled more and last year we hauled every box of fruit that was packed, so that not a single box of fruit packed or shipped by our association was packed anywhere except in our own cold storage and packing house. I think it is just as important a feature in the general success of the apple growing business as any that has been discussed in connection with it. It seems to me that when you come down to the pack of your fruit you should consider yourself a manufacturing plant and you should run that manufacturing plant on a purely manufacturing basis.

"We have one plant which has a 40-car cold storage capacity and an up-to-date packing room sufficient for our needs, and I have persuaded every grower to let me haul his fruit in automobile trucks to this central plant in Medford. This means, more than anything else, standardization of pack. You have just one set of packers, you have one plant under one supervisor; you have one man who is attending to and is accountable for the proper packing of that fruit. In days gone by we ran three or four packing houses of our own and also had supervisors packing at from 12 to 20 packing houses on the ranches. We found it simply a physical impossibility to inspect that pack properly. That was the real reason for the starting of the move toward centralization. It does maintain a standardized pack. It relieves the grower of a lot of detail and worry when his time should be occupied with other things. I say to my growers, at the beginning of the season, this year our pears will cost 25 1-2 cents per box. That includes every item of supplies and labor that go into the packing of that fruit, including carloading, with the exception of the actual cost of hauling the fruit to my door. In other words, he gets his pears packed from my door until they are on the cars for 25 1-2 cents a box and his apples for 28 1-2 cents. We do not own our trucks, but we have some very live wires in the trucking business.

"Our problems are little different from any that most growers have to contend with. For the last three years 50 per cent of our tonnage has been pears, and I think it will increase. Pears, as you may know, especially Barletts picked in August, are pretty perishable commodity and just there is where this centralization of packing is peculiarly efficient. We persuaded our growers to haul in auto trucks and to let us haul them at night. All through the Bartlett season we never received a box of fruit at the packing house after 7 o'clock in the morning or before 6 o'clock at night. All the fruit was received by a night crew. We ran as high as 5300-odd loose boxes at night; for three days we ran over 500 a night and for the same three days we averaged seven cars a day packed. It never once occurred during the hot Bartlett season (and we handled something like 75 cars) that the fruit hauled at night was left over tomorrow. Of course that is not so necessary in handling apples and we do not haul at night during the apple season, but we can do it; the results of the centralization of packing are really very remarkable. I believe that sooner or later every district in the northwest is coming to that idea of packing every box of fruit it ships at one place.



"I have heard some talk about the disposition of the culls. Again there is an attractive feature of the centralization idea. You have all your culls concentrated in one place and it is easy enough to sell in carloads. I have sold this year something like six carloads of apples in bulk and mainly because I had them at one spot and there was no difficulty in getting rid of them. I got $6.50 at my sidetrack; we charge nothing for handling of culls, so that all we get goes to the grower. They are used mostly in our valley in the manufacture of apple juice. We have two concerns there that have quite solved the problem of putting out fresh cider in hermetically sealed tin. I should like to see the time when all associations could get together and own their own cider and evaporating plant. That is another idea that makes the centralization very attractive."

DISCUSSION.

Question: Why did you inaugurate the plan of hauling apples in trucks?

Mr. Beckwith: It isn't every grower that will haul his apples with proper springs.

These trucks would haul from 150 to 225 boxes and it was like riding on a feather bed.

Smooth, Clean Potatoes

First rid your seed potatoes of scab and black-leg diseases before planting and you can be assured of a 30% to 40% increase yield.

FORMALDEHYDE
The Farmer's Friend

is *the* official standard seed cleanser. Potato scab and black-leg once in the ground may persist for many years. The U.S. Dept. of Agriculture recommends cleansing seeds with Formaldehyde solution to prevent spread of potato diseases. It destroys smuts of grain and fungus growths. One pint 35 cents at your dealer treats 40 bushels of seed. New and illustrated book sent *free*.

SAW 10 LOGS WITH AN AMERICAN SAW MILL

AND GET LUMBER WORTH $25 TO $40

Ten 16 foot logs averaging 14 inches thick make 1000 feet of lumber worth $25 to $40 in your local market. Costs you only $4 to $6 to saw 1000 feet with an "American" Portable Saw Mill. Think of the profits! Why, that timber on your wood-lot is just like wheat. Reap it with an axe. Harvest it with an inexpensive, light running "American" Portable Saw Mill you can operate yourself. No experience needed. An 8 H.P. gas engine and an "American" mill saws up to 2500 feet per day. Get an "American" because it saws more and better lumber with less help and power than any other. Make big money every winter when the farm doesn't need you. Hundreds of farmers are doing a paying lumbering business with "American" mills. You can do the same, for there are wood-lots around you if you have none yourself. Read enthusiastic letters from farmers in our free Book No. 7 that tells all about farm lumbering.

HIGGINS MACHINERY CO., 315 First Ave. South, Seattle, Wash.

The Vaughan Portable Drag Saw

This is the original machine. They have been in use over three years and are past the experimental stage.

Simplest, Strongest, Lightest and Fastest Drag Saw Built

Chain drive; can be used in any position. Bad weather does not hinder operation; one man operates it and moves it on the log; two men can carry it anywhere.

Insect Pests Make Trouble

Weevils and Maggots Lead Many to Abandon Rutabagas, Peas, Strawberries and the Like in Parts of Western Washington.

Lewis County, Wash.—Insect pests have driven the pea and the rutabaga off the farms of this county in a large measure.

Klickitat County, Wash.—Cattle on the grain farm are considered profitable for cleaning up waste from the grain fields and waste lands.

Okanogan County, Wash.—One of the county's greatest need is additional railroad facilities.

Insects Do Damage.

CHEHALIS, Lewis County, Wash., Jan. 26.—The leading products in this county are hay, oats, potatoes, a little wheat, barley and rye, kale, peas, small fruits and root crops. Hay, oats and pasture are the most valuable products. In early times peas and rutabagas were largely raised, but pea weavil, turnip worms and flea beetles have cut down the acreage to a great extent. High cost and lack of energy of labor eliminates all profits from garden and root crops. We have had an exceptionally good winter. Most of the upland is plowed and considerable bottom land, which is often too wet to plow until May. We expect, from the present outlook, that the crops will go in earlier this spring and in better shape than usual and prospects of extra good prices. L. K. COGSWELL.

Cattle on Grain Farm.

BICKLETON, Klickitat County, Wash., Jan. 24.—Although it is cold, there is no snow on the ground, as a chinook melted all the snow about 10 days ago, and many farmers commenced plowing, then the ground froze again about eight inches. The farmers consider the fall wheat prospect poor, as none is in sight above the ground and part of the kernels appear to be rotten. In all probability there will be much spring grain sown, although the fall grain still has a chance to come through. This community is increasing its production of grain every year, partly because of increased acreage and also because of better farming methods employed. One improvement noticeable is better building on the farms, also a better grade of live stock. There is one improvement I would like to see, and that is a better cooperative spirit among the farmers and more of a "get-together-and-boost" spirit in our towns. I do not agree with the idea of raising cattle on a wheat farm. It may apply to certain conditions in some territories, but here it is very profitable to have a bunch of cattle to eat up the waste of the field, as nearly every ranch around here has some waste land which can not produce grain and is used as pasture in the summer. In winter, up until December, the cattle feed upon the straw stacks and waste grain in the stubble, which otherwise would go to waste. I have a small bunch of stock around my straw stacks that I have not fed a spear of grain to yet, and they are looking fine, and with beef cattle selling at from $60 to $80 per head there is some money in straw stacks. BERT H. FAULKNER.

Need a Railroad.

TWISP, Okanogan County, Wash., Jan. 23.—The live stock man, the dairyman and the grain producer are preparing for a larger output the coming season. There has been a noticeable improvement in live stock here, as to horses, beef cattle, dairy stock and hogs. We would like to see a railroad through this vicinity so we could be on a par with outside markets. Under present conditions our products have to be freighted 30 miles by wagon and auto trucks in summer, and on sleds in winter, and this makes the expense greater than the profit on many articles. Very little fall grain was sown, and the ground was so dry up until freezing weather that the grain did not come up, with the exception of that grown on irrigated ground. The farmers are planning to do considerable spring seeding. A farm loan association was discussed at our grange recently, and a committee of three was appointed to investigate local conditions and report at the next meeting. Several have expressed a desire for an organization at Bureau Creek. We feel certain that we will soon have an organization. Great interest is shown in the Bureau Creek grange that was recently organized by C. L. Young, and we hope as great a benefit will be derived in buying the necessities and marketing our farm products, besides the importance of pulling together on all issues that have a tendency to improve conditions in our community.

GEORGE LA RUE.

Winter Severe on Grain.

LACROSSE, Whitman County, Wash., Jan. 29.—The ground being frozen since December first, and getting down to a depth of a foot or more which the chinook of the last week failed to lift, the winter wheat, which is the leading crop here, is in the poorest condition in many years, as the late, dry fall, followed by freezing temperatures, caused poor germination and very little growth. Possibly but half of the usual area was seeded last fall and the major crop will be spring sown. Nearly all forms of precipitation this winter since December is practically a tatal loss, as the frozen soil caused nearly all the water to run off; a condition which may affect crops next season. Live stock of all kinds are doing well, but hogs are getting very scarce.

M. E. SCHRECK.

Improvement in Live Stock.

CASTLEROCK, Cowlitz County, Wash., Jan. 26.—The coming season promises much to the farmer in this section of the state. There has been a decided increase in the improvement of live stock for breeding purposes, and winter grains have come through in splendid shape, green and thrifty. Fruit in this section of Cowlitz county grows prolific, but our market is limited and when we try to ship them into the city market along comes an inspector looking for trouble and he generally finds it, to the sorrow of the grower. What we need is a man for each county to help solve some of the difficulties the grower is up against in pruning, spraying, picking, packing and marketing. This community has started in on a wise plan, raising more dairy stock. Hogs do fine here, and the way pork is shipped into the Seattle market from this point makes a very profitable line of work for the farmer. Right here I will say that one farmer told me that his artichokes reduced the grain one-half in fattening his hogs, and the meat was of a better quality. He planted 14 sacks last spring on about 12 1-2 acres, and he estimated that he had 15 tons. I am of the impression that if this line is followed out it will prove one of the best solutions in utilizing the stump lands. Ten leading products in this county are: Grain, including barley, oats, some wheat, hay, potatoes, and all classes of vegetables that will grow in the northwest. Some of the farmers have been testing out the growing of vetch and it has proven a decided success; stock do well on it, and the crop yield is large. It takes rich soil and plenty of moisture in the fore part of the season, which we have here. Alfalfa does not seem to do as well, and some that have tried it say that there are other things that they can turn their attention to that will pay better and be more satisfactory, so have abandoned it. Still, in the southern part, near Woodland, a few have made a success, cutting six tons to the acre in small acreage. Potatoes seem to be the banner crop for us here. When the buyers came around and offered $30 per ton a number of farmers were too busy at something else so did not get around to sell at that time; now they are hugging themselves, as potatoes are up around $40 per ton, and indications are they will go higher. Some say they will not take less than $60 per ton, which goes to show that we are all on about the same scale, as "the more we get the more we want."

C. C. BROWN.

Want More Silos.

NEWPORT, Pend Oreille County, Wash., Jan. 29.—Pend Oreille county is rapidly increasing in its live stock and dairy products. The Citizens' club of Newport has taken up the slogan of "A Silo on Every Farm," and I think this indicates pretty clearly what is in the mind of the general populace as to the most crying need of the county. Live stock and dairying will undoubtedly be the dominant industries eventually in this county because of its rainfall and its natural adaptability to all tame grasses. I do not think that any damage has been sustained by the fall grain in the county, because the ground is well covered with a heavy blanket of snow and therefore well protected. Judging from previous winters here I would say the outlook for grain this year is excellent indeed, and, as we have a very large home market, the farmer should prosper.

CHAS. M. TALMADGE.

HOLDS DOOR OPEN.

To the Editor: Am sending you an illustration of a simple device for holding doors open when the old-fashioned lock is used. Take a half-inch board, eight inches long and three inches wide and shape it like the above cut. Screw it to a 2x4 on the barn where the stick on the lock projects. Nail it so the projecting stick hits the lock about one-fourth of an inch above the point. With a little pressure, the slope of the lock will make the projecting stick move up. When it comes to the notch in the lock it will drop down, locking the door back securely.

Is War Inevitable?

Pres. Wilson Breaks With Germany

WHAT LINCOLN BELIEVED.

Let us have faith that right makes might; and in that faith let us dare to do our duty as we understand it.

Feb. 21, 1859. ABRAHAM LINCOLN.

As this is written, the question in the minds of the civilized world is: Will the United States be drawn into actual war with Germany and her allies?

All diplomatic relationships between the two countries were broken Friday morning by President Wilson. Count von Bernstorff, German ambassador to this country, was given his passports, that he might return to Berlin; Ambassador Gerard, who has represented this country at Berlin, was asked to come home; the Swiss government has been asked to take over the conduct of American affairs in the German capital in so far as such affairs may be conducted under the critical conditions now existing and which are growing more critical with the passage of each hour.

The present situation comes to pass as a direct result of the formal announcement to the world by Germany that submarine warfare would be carried on without reserve in the waters surrounding the enemies of that country and her allies. No vessel, stated the announcement, whether neutral or enemy, could traverse those waters, owing to the determination of Germany and her allies of completely shutting food supplies and munitions from her enemies at whatever cost.

Violation of Pledge.

This announcement amounted to a specific renunciation of Germany's pledge made to President Wilson several months ago that her submarines would not be permitted to destroy any vessels without warning and without steps being taken to save the lives of those on board.

Speculation as to the real meaning of the new movement on the part of the Teutonic allies is varied. Some believe that it is made as a final, desperate effort to bring England and France to submission because of starvation before the same fate overtakes the teutons. The justification claimed by the Teutonic powers for the drastic move is that England has been practicing the starvation policy against Germany and Austria.

Loyalty in America.

Statesmen, members of state legislatures, private citizens and citizens of foreign birth have declared themselves loyally behind the president in his movements, come what may. Among the leading men of the nation who have made formal statements of loyalty are Vice President Marshall, Theodore Roosevelt, Senators Stone and Lodge of the foreign relations committee of congress, Senators Poindexter, Kern, Gallinger, Reed, Smoot, Chamberlain, Cummins and Weeks and Speaker Clark and Republican Leader Mann of the house of representatives.

German - American newspapers throughout the United States have expressed loyalty to the land of their adoption, though expressing deep regret that such serious difficulties should have come to pass between their native land and their adopted land.

German Vessels Seized.

Steps have been taken to seize German vessels which have taken refuge in harbors of the United States since the beginning of the war. Formal seizure of some of them, including the Prinz Eitel Frederick and the Prinz Wilhelm, has been made. There are claimed to be 95 German ships in American harbors, having a gross tonnage of over 600,000 tons. In New York harbor there are 31 of these vessels.

Precautions Taken.

Immediately following the breaking off of relations with Germany, military and naval precautions were taken by authorities all over the United States, even to the placing of guards about state militia armories.

All navy yards and stations were closed to the public, only employes and officers and enlisted men of the navy to be admitted until further notice.

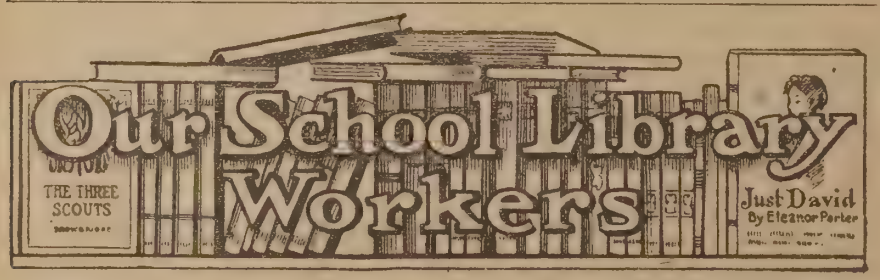
Officers commanding army posts, arsenals, magazines and coast batteries were directed to exercise every precaution.

The state, war and navy building at Washington was closed to visitors and cards of identification were issued to employes and press representatives entitled to admission.

Publication of the daily ship movement list, giving the departures and arrivals of naval vessels, was suspended.

The White House and White House grounds were closed to visitors for the first time in many years.

Precautions were taken to safeguard munitions plants throughout the country, both private and public.



U. S. Naval Equipment.

It is admittedly difficult to place the United States in its relative strength from a war point of view, especially since the beginning of the present war during which vast destruction has been wrought and vast additions have been made to the navies of the warring nations.

The following are figures compiled on the U. S. Navy slightly more than one year ago: Modern battleships, 12; cruiser battleships, none; older battleships, 30; armored cruisers, 10; first-class cruisers, 5; second-class cruisers, 4; third-class cruisers, 16; gunboats, 30; monitors, 9; torpedo boat destroyers, 74; torpedo boats, 19; submarines, 73. This is a total of 282 vessels, manned by 55,000 men and officers.

At the same time as these figures were compiled, Germany had a total of 355 vessels manned by 79,000 men and officers, and England had a total of 631 vessels manned by 150,000 men and officers.

Yakima county is rubbing Stevens county pretty close in the matter of state honors for individual subscription work. Superintendent C. A. Payne of the White Swan public schools says, in reporting progress of his campaign, which the pupils of his school have just begun: "I am enclosing a check for $17.50, the result of the first day's effort on the part of our boys. I turned them loose last Friday at 4:30. At 6:50 two lads were back with $12. Loyal C. R. Snyder took eight subscriptions in that time."

This excellent work should be an incentive for other schools to take up a library campaign. This boy's work shows that he took one subscription every 15 minutes during the two hours he worked, and we have no doubt that other boys in the White Swan library teams will do equally as well. Let us hear from other schools, because we feel that the White Swan champion subscription getter will have to look to his laurels before the school library campaign is over in Yakima county.

Now, boys and girls, the library man who gets all the reports from your teacher just simply can't help but feel that each one of you will try to turn in at least one subscription to your teacher during the next week to help get new books for your school. These can be either "new" or "renewal" subscribers, as they all count the same in the campaign. Come, now, everybody!

Snails as Barometers.

Snails are excellent barometers. If there is rain in the air snails will seek shelter under leaves, in the bark of a tree or any other handy place.

What Farm Animal Does This Represent?

Any person sending the correct answer to the above question before February 14, together with $2 in the form of money order, 2-cent stamps or personal check, will receive the Washington Farmer for three years and any one of the following standard high class magazines for one year: American Magazine, Metropolitan Magazine, Woman's Home Companion or Every Week.

Just see what these publications would cost you at the regular rates:

Washington Farmer, 3 years	$3.00	Washington Farmer, 3 years	$3.00
American Magazine, 1 year	$1.50	Woman's Home Companion, 1 year	$1.50
	$4.50		$4.50
Washington Farmer, 3 years	$3.00	Washington Farmer, 3 years	$3.00
Metropolitan Magazine, 1 year	$1.50	Every Week, 1 year	$1.00
	$4.50		$4.00

If you send the correct answer, any one of the above club combinations will cost you only $2.

If your answer is incorrect your money will be returned promptly. This offer is limited to replies mailed before February 14, as shown by the postoffice dating stamp on your envelope. Address

Why I Read

Health of Mind for One Thing

By MARIELLA LADD.

Reading—what part does it play in the recreation and inspiration of the woman on the farm? How can she find time to read, by arranging her daily work carefully; how reading overcomes the tendency to worry and keeps the mind balanced and cool; what influence reading in the home has upon the children—these are a few of the points brought out by Mrs. Mariella Ladd, herself a farm woman, in a series of short articles which are to run in the Farmer. The first article, "Why I Read," will be found in this issue. This will be followed by "Reading and Education," "How I Find Time to Read" and "What I Like to Read."

Is recreation necessary? Or do these readers simply waste their time in securing it?

There can be only one answer to this question by any one who knows the least thing about farm life. The brightest and best work is always done by those who take systematic recreation.

Doctors have proved by experiment that work done by men and women who take time for recreation is much more valuable than similar work done by men and women who keep at work beyond the fatigue point and so cannot enjoy their leisure profitably. This is especially true of the farm housewife.

Recreation is as necessary as food. Reading, the best form of recreation for physical workers, provides the mind with food. Health of mind is even more important than health of body, because the mind largely rules the body. A hungry or empty mind is a poor ruler.

But, objects some one, how did the old folks who could not get books manage to live such creditable lives?

Because they took recreation in different ways. In the olden days families were large and homes were more attractive than they are today. Travel was less common, the world of the farmer was a small one. In this world his native humor helped him to see many amusing incidents and fed his human interest. Competition was less keen in the olden days. A man was more at liberty to follow his bent than he is now. A man who can follow his bent finds recreation even in his work.

Reading, however, is not only recreational. It is a means of inspiration as well. By reading the farm child learns how to interpret Nature and how to understand Nature's ways so that he can take advantage of them. Reading alone will not teach him this, of course. Reading must go hand in hand with observation and experiment. In the library units prepared for circulation among the schools of Washington by the Washington Farmer the books are chosen with this great fact in view. The books offered to the farm readers through these country schools are full of this appeal and are written by men and women who love Nature and believe the understanding of Nature to be at the heart of sound knowledge.

It is not accidental that Mary Lyon, the pioneer of women's higher education in America; Clara Barton, founder of the American Red Cross, which has earned the gratitude and admiration of the world, and Frances Willard, whose ideals are doing so much to protect and purify the American home, were all farm girls. They knew what it was to have busy hands and busy feet for many hours of the day. They spent their spare time in building up their minds, in reading, in thinking, in planning. Without books their plans would have been narrower and the world would be a much poorer place to live in today.

Librarians who have served country districts with books tell us that farm patrons are not carried away by books that have a great sale in the cities but only live for a few years. This fact points to the natural thoroughness of farm reading. Farm children are much more practical than city children. They like to test out ideas. It is only the best books that have ideas which will bear testing out. This fact presents another argument for promoting reading on the farm. Ideas provoke ideas. Mind acting upon mind becomes more fruitful. An idea presented to a practical mind multiplies in wealth and efficacy. An author, like a prophet, rarely knows the full meaning of what he puts forth. It is the practical people of the world who must take an author's idea and give it to the world in its most valuable form.

Next week Mariella Ladd will talk of the big part reading has to play in one's education.

Sidelights

And Yet He Lost.

Horatius was the greatest bridge player the world has ever known.—Deseret News.

Eat Slowly.

"Eat slowly and you will eat less." "That's true in most boarding houses, anyway."—Cleveland Leader.

Surest Thing You Know.

Where there's a will there's a way—to break it. Consult the probate court records and see.—Milwaukee News.

One Better.

"The old lady has named me as her heir."

"But she named me as her lawyer."—Life.

The Obvious One.

He—People are saying you married me for my money.

She—Well, I had to give them some reason.

Willies' Destructiveness.

"O-o-oh, m-o-ther," howled an Oklahoma City child, "Willie's broken my do-o-ll."

"The naughty boy! How did he do it?"

"I—I—I hit him on the head wiv it!" sobbed the little angel.

Room for a Large Company.

A little girl had been reprimanded by her mother for telling a falsehood. "Where do you think little folks go to that tell such stories?" asked the mother.

"I don't know," said the little girl, unconcernedly; "the same place big folks go to, I suppose."—Christian Herald.

Safety First.

A man observed that in these days of change and trying to keep up with Lizzie he had made it a rule never to ask a man how his wife was if he hadn't kept track of the pair for a couple of months. The rule was the result of his having said to a woman: "I had a long talk with your husband yesterday," and her reply: "Had you indeed? He's a very interesting man as I remember him."—Ladies' Home Journal.

She Was All Right.

There lives in Providence a very matter-of-fact man whose wife is, and always has been, a bit sentimental and fond of trying to draw from husband those little endearments he has ever failed to furnish.

"I suppose," said she, on one occasion, "if you should meet some pretty girl, you would cease to care for me."

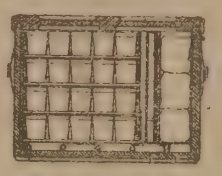
"What nonsense you talk!" said husband. "What do I care for youth or beauty? You suit me all right."

Hens and History.

After reading the famous poem, "The Landing of the Pilgrim Fathers," to the class, the teacher said: "As a drawing exercise, suppose you each draw, according to your imagination, a picture of Plymouth rock."

All but one little fellow set to work. He paused, and finally raised his hand.

"What is it, Edgar?" the teacher asked.



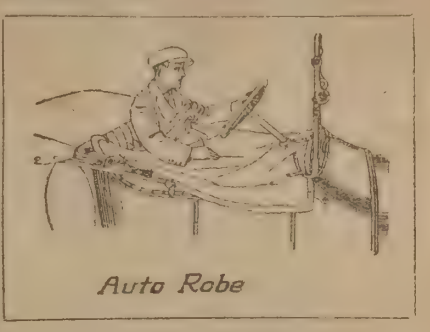
"Please, ma'am," Edgar piped out, "do you want us to draw a hen or a rooster?"—Ladies' Home Journal.

Inventions

By C. J. LYNDE, Macdonald College, Quebec.

Fruit Carrier.

The fruit here is packed in boxes and covered with oiled paper. It is



Fruit Carrier

cooled during transportation by ice packed in the chamber on the right. The cold air from the ice circulates on all sides of the fruit.

Automobile Robe.

This robe keeps the driver warm, but leaves his feet free to manipulate

Auto Robe

the pedals. It is atached by buttons on the sides of the car and by straps which buckle around the wind shield.

WHEAT LANDS

30,000 Acres, Tributary to Main Line of Chicago, Milwaukee & St. Paul Railroad, to Be Closed Out for an Eastern Syndicate

$6.00 TO $22.00 PER ACRE

TEN ANNUAL PAYMENTS

In Tracts to Suit

What is probably the last opportunity in this state to get select lands at such low prices and easy terms is here offered. These lands are in Adams and Grant counties, within 160 miles of Seattle, and are included under the proposed Quincy Irrigation Project.

Whole sections can be plowed without striking a stone or stump. The surface is largely covered with a luxuriant growth of bunchgrass.

The improved farms already dotting this fertile region are served by many good roads, and there are several schools already established.

This is a rare opportunity. Write or call at once for particulars.

ESTABLISHED 1888

Glimpses of Life in the Open Throughout the Pacific Northwest

1

2

3

4

The Pacific northwest is not only a land of promise, but is already a land of realization of life in the open, of a diversity of farm products—a land where new rural social problems are being worked out successfully.

The first picture on this page gives a glimpse of an almost ideal farm scene in the vicinity of Hageman, Idaho.

Many girls, as well as boys, are looking forward to and hoping for a trip to the fairs next fall; some as a result of winning in the boys' and girls' club contests. No. 2 is a picture of the camp school for girls at the last Oregon State fair, and here is a list of those who were present:

Benton county—Inez Starr, Corvallis.

Clackamas county—Evelyn Bohlander, Oregon City; Anna Mullenhoff, Boring.

Douglas county—Eva Blackwell, Riddle; Leta Wilson, Talent.

Hood River county—Beatrice Angus, Hood River; Dorothy Pennock, Cascade Locks.

Jackson county—Lucile E. Holdridge, Leta Stevens, Talent.

Lane county—Leia Hennis, Marcola; Gertrude Neet, Fall Creek.

Lincoln county—Myrtle Bloom, Myrabel Bloom, Rose Lodge.

Linn county—Muriel Blume, Albany; Nellie Morford, Junction City.

Malheur county—Helen Peck, Nyssa.

Marion county—Alice Jaquet, Silverton; Rose Winslow, Aumsville.

Morrow county—Elizabeth Brown, Vera Cowins, Heppner.

Multnomah county—Margaret Jonas, Lilly Luscher, Fairview.

Polk county—Hazel Bursell, Monmouth; May McDonald, Dallas.

Tillamook county—Lucy Daniels, Molher; Ellen Norberg, Tillamook.

Umatilla county—Dorothy Briggs, Hermiston; Carmen Jones, Pendleton.

Union county—Clara Courtney, Evelyn Guhlman, La Grande.

Wasco county—Arta M. Cole, Ora L. Evans, Mosier; Louise Morgensen, Tygh Valley.

Washington county—Margaret Bunger, North Plains; Lois Holmes, Sherwood.

Wheeler county—Lydia E. Prindle, Fossil.

No. 3 is a picture of Robert T. Reid, standing near a quince tree on his farm on the east side of Lake Washington, in King county. Something about Mr. Reid's farming operations will be found further on in this article.

No. 4 is a field of buckwheat raised in a peach orchard near Woodburn, Ore.

There is not a great deal of buckwheat raised in the Willamette valley. One of the seedmen of Portland, on being questioned regarding the production of buckwheat, said that he did not believe there is more than 5000 acres in the whole state sown to buckwheat. Most of it is in small patches, sown for bees.

(Continued on page thirty.)

WHEN KNIGHTHOOD WAS IN FLOWER

or, the Love Story of Charles Brandon and Mary Tudor, the King's Sister, and Happening in the Reign of His August Majesty, King Henry the Eighth.

By EDWIN CASKODEN (Charles Major).

Copyright, 1898, The Bobbs-Merril Co.

SYNOPSIS.

Charles Brandon, who has neither wealth nor title, wins distinction for having defeated the heretofore unconquerable duelist, Judson. Brandon is installed as one of the captains of the guard of King Henry VIII. Edwin Caskoden (who tells the story) is Master of the Dance at London Court. The two young men become fast friends. Edwin tells Brandon of the willful, but adorable Mary Tudor, who had coaxed her royal brother Henry out of many proposed marriages which had been arranged for Henry's advantage. Edwin confesses that he, like scores of other men, had fallen in love with Mary, but upon Mary's refusal to marry him, he immediately became attracted to the good and beautiful Lady Jane Bolingbroke.

At their first meeting, Mary and Brandon have a tilt, in which Mary comes off second best and acknowledges it. Wondering as to Brandon's social accomplishments, and to settle a wager with Sir Edwin that he could not dance, Mary invites Brandon, Edwin and Jane to her drawing room. To her surprise and Edwin's delight Brandon is perfectly at east and proves that he knows more about dancing than the Master of the Dance, himself. He teaches the Princess Mary one of the new French dances. At a ball, given by Mary, Brandon makes an enemy of the Duke of Buckingham, the most powerful nobleman in the realm, after which the princess asks Brandon to open the dance.

CHAPTER V.—(Continued

It was done prettily. The whole girl changed as scon as she found herself in front of him. In place of the old-time confidence, strongly tinged with arrogance, she was almost shy, and blushed and stammered with quick coming breath, like a burgher maid before her new-found gallant. At once the courtiers made way for her, and out she walked, leading Brandon by the hand. Upon her lips and in her eyes was a rare triumphant smile, as if to say:

"Look at this handsome new trophy of my bow and spear."

I was surprised and alarmed when Mary chose Brandon, but when I turned to the musicians to direct their play, imagine, if you can, my surprise when the leader said:

"Master, we have our orders for the first dance from the princess."

Imagine, also, if you can, my double surprise and alarm, nay, almost my terror, when the band struck up Jane's "Sailor Lass." I saw the look of surprise and inquiry which Brandon gave Mary, standing there demurely by his side, when he first heard the music, and I heard her nervous little laugh as she nodded her head, "Yes," and stepped closer to him to take position for the dance. The next moment she was in Brandon's arms, flying like a sylph about the room. A buzz of astonishment and delight greeted them before they were half way around, and then a great clapping of hands, in which the king himself joined. It was a lovely sight, although, I think, a graceful woman is more beautiful in La Galliard than any other dance, or, in fact, any other situation in which she can place herself.

After a little time the Dowager Duchess of Kent, first lady in waiting to the queen, presented herself at the musicians' gallery and said that her majesty had ordered the music stopped, and the musicians, of course, ceased playing at once. Mary thereupon turned quickly to me:

"Master, are our musicians weary that they stop before we are through"

The queen answered for me in a high-voiced Spanish accent: "I ordered the music stopped; I will not permit such an indecent exhibition to go on longer."

Fire sprang into Mary's eyes and she exclaimed: "If your majesty does not like the way we do and dance at my balls you can retire as soon as you see fit. Your face is a kill-mirth anyway." It never took long to rouse her ladyship.

The queen turned to Henry, who was laughing, and angrily demanded:

"Will your majesty permit me to be thus insulted in your very presence?"

You got yourself into it; get out of it as best you can. I have often told you to let her alone; she has sharp claws." The king was really afraid of Catherine's sour frown before he married her. It was her dower of Spanish gold that brought her a second Tudor husband.

"Shall I not have what music and dances I want at my own balls?" asked the princess.

"That you shall, sister mine; that you shall," answered the king. "Go on master, and if the girl likes to dance that way, in God's name let her have her wish. It will never hurt her; we will learn it ourself, and will wear the ladies out a-dancing."

After Mary had finished the opening dance there was a great demand for instruction. The king asked Brandon to teach him the steps, which he soon learned to perform with a grace perhaps equaled by no living creature other than a fat brown bear. The ladies were at first a little shy and inclined to stand at arm's length, but Mary had set the fashion and the others soon followed. I had taken a fiddler to my room and had learned the dance from Brandon; and was able to teach it also, though I lacked practice to make my step perfect. The princess had needed no practice, but had danced beautifully from the first, her strong young limbs and supple body taking as naturally to anything requiring grace of movement as a cygnet to water.

This, thought I, is my opportunity to teach Jane the new dance. I wanted to go to her first, but was afraid, or for some reason did not, and took several ladies as they came. After I had shown the step to them I sought out my sweetheart. Jane was not a prude, but I honestly believe she was the most provoking girl that ever lived. I never had succeeded in holding her hand even the smallest part of an instant, and yet I was sure she liked me very much; almost sure she loved me. She feared I might unhinge it and carry it away, or something of that sort, I suppose. When I went up and asked her to let me teach her the new dance, she said:

"I thank you, Edwin; but there are others who are more anxious to learn than I, and you had beter teach them first."

"But I want to teach you. When I wish to teach them I will go to them."

"You did go to several others before you thought of coming to me," answered Jane, pretending to be piqued. Now that was the unkindest thing I ever knew a girl to do—refuse me what she knew I so wanted, and then put the refusal on the pretended ground that I did not care much about it. I so told her, and she saw she had carried things too far, and that I was growing angry in earnest. She then made another false, though somewhat flatering, excuse:

"I could not bear to go through that dance before so large a company. I should not object so much if no one else could see—that is, with you—Enwin." "Edwin!" Oh! so soft and sweet! The little jade! to think that she could hoodwink me so easily, and talk me into a good humor with her soft, purring "Edwin." I saw through it all quickly enough, and left her without another word. In a few minutes she went into an adjoining room where I knew she was alone. The door was open and the music could be heard there, so I followed.

"My lady, there is no one to see us here; I can teach you now, if you wish," said I.

She saw she was cornered, and replied, with a toss of her saucy little head: "But what if I do not wish?"

Now this was more than I could endure with patience, so I answered: "My young lady, you shall ask me before I teach you."

"There are others who can dance it much better than you," she returned, without looking at me.

"If you allow another to teach you that dance," I responded, "you will have seen the last of me." She had made me angry, and I did not speak to her for more than a week. When I did—but I will tell you of that later on. There was one thing about Jane and the new step; so long as she did not know it, she would not dance it with any other man, and foolish as my feeling may have been, I could not bear the thought of her doing it. I resolved that if she permitted another man to teach her that dance it would be all over between us. It was a terrible thought to me, that of losing Jane, and it came like a very stroke upon my heart. I would think of her sweet little form, so compact and graceful; of her gray, calm eyes, so full of purity and mischief; of her fair oval face, almost pale, and wonder if I could live without the hope of her. I determined, however, that if she learned the new dance with any other man I would throw that hope to the winds, whether I lived or died. St. George! I believe I should have died.

The evening was devoted to learning the new dance, and I saw Mary busily engaged imparting information among the ladies. As we were about to disperse I heard her say to Brandon:

"You have greatly pleased the king by bringing him a new amusement. He asked me where I learned it, and I told him you had taught it to Caskoden, and that I had it from him. I told Caskoden so that he can tell the same story."

"Oh! but that is not true. Don't you think you should have told him the truth, or have evaded it in some way?" asked Brandon, who was really a great lover of the truth, "when possible," but who, I fear on this occasion, wished to appear more truthful than he really was. If a man is to a woman's taste, and she is inclined to him, he lays up great stores in her heart by making her think him good; and shameful impositions are often practiced to this end.

Mary flushed a little and answered, "I can't help it. You do not know. Had I told Henry that we four had enjoyed such a famous time in my rooms he would have been very angry, and—and—you might have been the sufferer."

"But might you not have compromised matters by going around the truth some way, and leaving the impression that others were of the party that evening?"

That was a mistake, for it gave Mary an opportunity to retailiat: "The best way to go around the truth, as you call it, is by a direct lie. My lie was no worse than yours. But I did not stop to argue about such matters. There is something else I wish to say. I want to tell you that you have greatly pleased the king with the new dance. Now teach him honor and ruff and your fortune is made. He has had some Jews and Lombards in of late to teach him new games at cards, but yours is worth all of them." Then, somewhat hastily and irrelevantly, "I did not dance the new dance with any other gentleman—but I suppose you did not notice it," and she was gone before he could thank her.

CHAPTER VI.

The princess knew her royal brother. A man would receive quicker reward for inventing an amusement or a guady costume for the king than winning him a battle. Later in life the high road to his favor was in ridding him of his wife and helping him to a new one—a dangerous way though, as Wolsey found to his sorrow when he sunk his glory in poor Anne Boleyn.

Brandon took the hint and managed to let it be known to this play-loving king that he knew the latest French games. The French Duc de Longueville had for some time been an honored prisoner at the English court, held as a hostage from Louis XII., but de Longueville was a blockhead, who could not keep his little black eyes off our fair ladies, who hated him, long enough to tell the deuce of spades from the ace of hearts. So Brandon was taken from his duties, such as they were, and placed at the card table. This was fortunate at first; for being the best player the king always chose him as his partner, and, as in every other game, the king always won. If he lost there would soon be no game, and the man who won from him too frequently was in danger at any moment of being rated guilty of the very highest sort of treason. I think many a man's fall, under Henry XIII., was owing to the fact that he did not always allow the king to win in some trivial matter of game or joust. Under these conditions everybody was anxious to be the king's partner. It is true he frequently forgot to divide his winnings, but his partner had this advantage, at least; there was no danger of losing. That being the case, Brandon's seat opposite the king was very likely to excite envy, and the time soon came, Henry having learned the play, when Brandon had to face some one else, and the seat was too costly for a man without a treasury. It took but a few days to put Brandon hors de combat, financially, and he would have been in a bad plight had not Wolsey come to his relief. After that, he played and paid the king in his own coin.

This great game of "honor and ruff" occupied Henry's mind day and night during a fortnight. He feasted upon it to satiety, as he did with everything else; never having learned not to cloy his appetite by overfeeding. So we saw little of Brandon while the king's fever lasted, and Mary said she wished she had remained silent about the cards. You see, she could enjoy this new plaything as well as her brother, but the king, of course, must be satisfied first. They both had enough eventually; Henry in one way, Mary in another.

One day the fancy struck the king that he would rebuild a certain chapel at Windsor; so he took a number of the court, including Mary, Jane, Brandon and myself, and went with us up to London, where we lodged overnight at Bridewell house. The next morning—as bright and beautiful a June day as ever gladdened the heart of a rose—we took horse for Windsor, a delightful seven-league ride over a fair rode.

Mary and Jane traveled side by side, with an occasional companion or two, as the road permitted. I was angry with Jane, as you know, so did not go near the girls; and Brandon, without any apparent intention one way or the other, allowed events to adjust themselves, and rode with Cavendish and me.

We were perhaps forty yards behind the girls, and I noticed after a time that the Lady Mary kept looking backward in our direction, as if fearing rain from the east. I was in hopes that Jane, too, would fear the rain, but you would have sworn her neck was stiff, so straight ahead did she keep her face. We had ridden perhaps three leagues when the princess stopped her horse and turned in her saddle. I heard her voice, but did not understand what she said.

In a moment some one called out: "Master Brandon is wanted." So that gentleman rode forward, and I followed him. When we came up with the girls Mary said: "I fear my girth is loose."

Brandon at once dismounted to tighten it, and the others of immediate party began to cluster around.

Brandon tried the girth.

"My lady, it is as tght as the horse can well bear," he said.

"It is loose, I say," insisted the princess, with a little irritation; "the saddle feels like it. Try the other." Then turning impatiently to the persons gathered around: "Does it requre all of you, standing there like gaping bumpkins, to tighten my girth? Ride on; we can manage this without so much help." Upon this broad hint everybody rode ahead while I held the horse for Brandon, who went on with his search for the loose girth. While he was looking for it Mary leaned over her horse's neck and asked: "Were you and Cavendish settling all the philosophical points now in dispute, that you found him so interesting?"

"Not all," answered Brandon, smiling.

"You were so absorbed, I supposed it could be nothing short of that."

"No," replied Brandon again. "But the girth is not loose."

"Perhaps I only imagined it," returned Mary carelessly, having lost interest in the girth.

I looked toward Jane, whose eyes were bright with a smile, and turned Brandon's horse over to him. Jane's smile gradually broadened into a laugh, and she said: "Edwin, I fear my girth is loose, also."

"As the Lady Mary's was?" asked I, unable to keep a straight face any longer.

"Yes," answered Jane, with a vigorous little nod of her head and a peal of laughter.

"Then drop back with me," I responded.

The princess looked at us with a half smile, half frown, and remarked: "Now you doubtless consider yourselves very brilliant and witty."

"Yes," returned Jane maliciously, nodding her head in emphatic assent, as the princess and Brandon rode on before us.

"I hope she is satisfied now," said Jane sotto voce to me.

"So you want me to ride with you?" I replied.

"Yes," nodded Jane.

"Why?" I asked.

(Continued on the following page.)

When Knighthood Was in Flower

BY EDWIN CASKODEN

(Continued from preceding page.)

"Because I want you to," was the enlightening response.

"Then why did you not dance with me the other evening?"

"Because I did not want to."

"Short but comprehensive," thought I, "but a sufficient reason for a maiden."

I said nothing, however, and after a time Jane spoke: "The dance was one thing and riding with you is another. I did not wish to dance with you, but I do wish to ride with you. You are the only gentleman to whom I would have said what I did about my girth being loose. As to the new dance, I do not care to learn it because I would not dance it with any man but you, and not even with you—yet." This made me glad, and coming from coy, modest Jane meant a great deal. It meant that she cared for me, and would, some day, be mine; but it also meant that she would take her own time and her own sweet way in being won. This was comforting, if not satisfying, and loosened by tongue: "Jane, you know my heart is full of love for you——"

"Will the universe crumble?" she cried with the most provoking little laugh. Now that sentence was my rock ahead, whenever I tried to give Jane some idea of the state of my affections. It was a part of the speech which I had prepared and delivered to Mary in Jane's hearing, as you already know. I had said to the princess: "The universe will crumble and the heavens roll up as a scroll ere my love shall alter or pale." It was a high-sounding sentence, but it was not true, as I was forced to admit, almost with the same breath that spoke it. Jane had heard it, and had stored it away in that memory of hers, so tenacious in holding to everything it should forget. It is wonderful what a fund of useless information some persons accumulate and cling to with a persistent determination worthy of a better cause. I thought Jane never would forget that unfortunate, abominable sentence spoken so grandiloquently to Mary. I wonder what she would have thought had she known that I had said substantially the same thing to a dozen others. I never should have won her in that case. She does not know it yet, and never shall if I can prevent. Although dear Jane is old now, and the roses on her cheeks have long since paled, her gray eyes are still there, with their mischievous little twinkle upon occasion, and—in fact, Jane can be as provoking as ever when she takes the fancy, for she is as sure of my affection now as upon the morning of that rare ride to Windsor. Aye, surer, since she knows that in all these years it has changed only to grow greater and stronger and truer in the fructifying light of her sweet face, and the nurturing warmth of her pure soul. What a blessed thing it is for a man to love his wife and be satisfied with her, and to think her the fairest being in all the world; and how thrice happy is he who can stretch out the sweetest season of his existence, the days of triumphant courtship, through the flying years of all his life, and then lie down to die in the quieted ecstasy of a first love.

So Jane halted my effort to pour out my heart, as she always did.

"There is something that greatly troubles me," she said.

"What is it?" I asked in some concern.

"My mistress," she answered, nodding in the direction of the two riding ahead of us. "I never saw her so much interested in any one as she is in your friend, Master Brandon. Not that she is really in love with him as yet, perhaps, but I fear it is coming and dread to see it. She has never been compelled to forego anything she wanted, and her desires are absolutely imperative. They drive her, and she is helpless against them. I think it never occurred to her that such a thing could be necessary; everything she wants she naturally thinks is hers by divine right. There has been no great need of such an effort until now, but your friend Brandon presents it. I wish he were at the other side of the world. I think she feels that she ought to keep away from him before it is too late, both for his sake and her own; but she is powerless to deny herself the pleasure of being with him, and I do not know what is to come of it all. That incident of the loose girth is an illustration. Did you ever know anything so bold and transparent? Any one could see through it, and the worst of all is she seems not to care if every one does see. Now look at them ahead of us! No girl is so happy riding beside a man unless she is interested in him. She was dull enough until he joined her. He seemed in no hurry to come, so she resorted to the flimsy excuse of the loose girth to bring him. I am surprised that she even sought the shadow of an excuse, but did not order him forward without any pretense of one. Oh! I don't know what to do. It troubles me greatly. Do you know the state of his feelings?"

"No," I answered, "but I think he is heart-whole or nearly so. He told me he was not fool enough to fall in love with the king's sister, and I really believe he will keep his heart and head, even at that dizzy height. He is a cool fellow, if there ever was one."

"He certainly is different from other men," returned Jane. "I think he has never spoken a word of love to her. He has said some pretty things, which she has repeated to me; has moralized to some extent, and has actually told her of some of her faults. I should like to see any one else take that liberty. She seems to like it from him, and says he inspires her with higher, better motives and a yearning to be good; but I am sure he has made no love to her."

"Perhaps it would be better if he did. It might cure her," I replied.

"Oh! no! no! not now; at first, perhaps, but not now. What I fear is that if he remains silent much longer she will take matters in hand and speak herself. I don't like to say that—it doesn't sound well—but she is a princess, and it would be different than with an ordinary girl; she might have to speak first, or there might be no speaking from one who thought his position too far beneath hers. She whose smallest desires drive her so, will never forego so great a thing as the man she loves only for the want of a word or two."

Then it was that Jane told me of the scene with the note, of the little whispered confidence upon her pillows, and a hundred other straws that showed only too plainly which way this worst of ill winds was blowing—with no good in it for any one. Now who could have foretold this? It was easy enough to prophesy that Brandon would learn to love Mary, excite a passing interest, and come off crestfallen, as all other men had done. But that Mary should love Brandon, and he remain heart-whole was an unlooked-for event—one that would hardly have been predicted by the shrewdest prophet.

What Lady Jane said troubled me greatly, as it was but the confirmation of my own fears. Her opportunity to know was far better than mine, but I had seen enough to set me thinking.

Brandon, I believe, saw nothing of Mary's growing partiality at all. He could not help but find her wonderfully attractive and interesting, and perhaps it needed only the thought that she might love him to kindle a flame in his own breast. But at the time of our ride to Windsor Charles Brandon was not in love with Mary Tudor, however near it he may unconsciously have been. He would whistle and sing, and was as light-hearted as a lark—I mean when away from the princess as well as with her—a mood that does not go with a heart full of heavy love, of impossible, fatal love, such as his would have been for the first princess of the first bloodroyal of the world.

But another's trouble could not dim the sunlight in my own heart, and that ride to Windsor was the happiest day of my life up to that time. Even Jane threw off the little cloud our forebodings had gathered and chatted and laughed like the creature of joy and gladness she was. Now and then her heart would well up so full of the sunlight and the flowers and the birds in the hedge—aye, and of the contagious love in my heart, too, that it poured itself forth in a spontaneous little song which thrills me even now.

Ahead of us were the princess and Brandon. Every now and then her voice came back to us in a stave of a song, and her laughter, rich and low, wafted on the wings of the soft south wind, made the glad birds hush to catch its silvery note. It seemed that the wild flowers had taken on their brightest hue, the trees their richest Sabbath day green, and the sun his softest radiance, only to gladden the heart of Mary that they might hear her laugh. The laugh would have come quite as joyously had the flowers been dead and the sun black, for flowers and sunlight, south wind, green pastures and verdant hills, all were riding by her side. Poor Mary! Her days of laughter were numbered.

We all rode merrily on to Windsor, and when we arrived it was curious to see the great nobles, Buckingham, both the Howards, Seymour and a dozen others stand back for plain Charles Brandon to dismount the fairest maiden and the most renowned princess in Christendom. It was done most gracefully. She was but a trifle to his strong arms, and he lifted her to the sod as gently as if she were a child. The nobles envied Brandon his evident favor with this unattainable Mary, and hated him accordingly, but they kept their thoughts to themselves for two reasons: First, they knew not to what degree the king's favor, already marked, with the help of the princess might carry him; and second, they did not care to have a misunderstanding with the man who had cut out Adam Judson's eyes.

We remained at Windsor four or five days, during which time the king made several knights. Brandon would probably have been one of them, as everybody expected, had not Buckingham related to Henry the episode of the loose girth, and adroitly poisoned his mind as to Mary's partiality. At this, the king began to cast a jealous eye on Brandon. His sister was his chief diplomatic resource, and when she loved or married it should be for Henry's benefit, regardless of all else.

Brandon and the Lady Mary saw a great deal of each other during this little stay at Windsor, as she always had some plan to bring about a meeting, and although very delightful to him, it cost him much in royal favor. He could not trace this effect to its proper cause and it troubled him. I could have told him the reason in two words, but I feared to put into his mind the thought that the princess might learn to love him. As to the king, he would not have cared if Brandon or every other man, for that matter, should go stark mad for love of his sister, but when she began to show a preference he grew interested, and it was apt sooner or later to go hard with the fortunate one. When we went back to Greenwich Brandon was sent on a day ahead.

CHAPTER VII.

After we had all returned to Greenwich the princess and Brandon were together frequently. Upon several occasions he was invited, with others, to her parlor for card playing. But we spent two evenings, with only four of us present, prior to the disastrous events which changed everything, and of which I am soon to tell you. During these two evenings the "Sailor Lass" was in constant demand.

This pair, who should have remained apart, met constantly in and about the palace, and every glance added fuel to the flame. Part of the time it was the princess with her troublesome dignity, and part of the time it was Mary—simply girl. Notwithstanding these haughty moods, any one with half an eye could see that the princess was gradually succumbing to the budding woman; that Brandon's stronger nature had dominated her with that half fear which every woman feels who loves a strong man—stronger than herself.

One day the rumor spread through the court that the old French king, Louis XII., whose wife, Anne of Brittany, had just died, had asked Mary's hand in marriage. It was this, probably, which opened Brandon's eyes to the fact that he had been playing with the very worst sort of fire, and first made him see that in spite of himself, and almost without his knowledge, the girl had grown wonderfully sweet and dear to him. He now saw his danger, and struggled to keep himself beyond the spell of her perilous glances and siren song. This modern Ulysses made a masterful effort, but alas! had no ships to carry him away, and no wax with which to fill his ears. Wax is a good thing, and no one should enter the siren country without it. Ships, too, are good, with masts to tie one's self to, and sails and rudder, and a gust of wind to waft one quickly past the island. In fact, one can not take too many precautions when in those enchanted waters.

Matters began to look dark to me. Love had dawned in Mary's breast, that was sure, and for the first time, with all its fierce sweetness. Not that it had reached its noon, or anything like it. In truth, it might, I hoped, die in the dawning, for my lady was as capricious as a May day; but it was love—love as plain as the sun at rising. She sought Brandon upon all occasions, and made opportunities to meet him; not openly—at any rate, not with Brandon's knowledge, nor with any connivance on his part, but apparently caring little what he or any one else might see. Love lying in her heart had made her a little more shy than formerly in seeking him, but her straightforward way of taking whatever she wanted made her transparent little attempts at concealment very pathetic.

As for Brandon, the shaft had entered his heart, too, poor fellow, as surely as love had dawned in Mary's, but there was this difference: With our princess—at least I so thought at the time—the sun of love might dawn and lift itself to mid-heaven and glow with the fervent ardor of high noon—for her blood was warm with the spark of her grandfather's fire—and then sink into the west and make room for another sun tomorrow. But with Brandon's stronger nature the sun would go till noon and there would burn for life. The sun, however, had not reached its noon with Brandon, either; since he had set his brain against his heart, and had done what he could to stay the all-consuming orb at its dawning. He knew the hopeless misery such a passion would bring him, and helped the good Lord, in so far as he could, to answer his prayer, and lead him not into temptation. As soon as he saw the truth he avoided Mary as much as possible.

As I said, we had spent several evenings with Mary after we came home from Windsor, at all of which her preference was shown in every movement. Some women are so impressive under strong emotion that every gesture, a turn of the head, a glance of the eyes, the lifting of a hand of poise of the body, speaks with a tongue of eloquence, and such was Mary. Her eyes would glow with a soft fire when they rested upon him, and her whole person told all too plainly what, in truth, it seemed she did not care to hide. When others were present she would restrain herself somewhat, but with only Jane and myself, she could hardly maintain a seemly reserve. During all this time Brandon remained cool and really seemed unconscious of his wonderful attraction for her. It is hard to understand why he did not see it, but I really believe he did not. Although he was quite at ease in her presence, too much so, Mary sometimes thought, and strangely enough sometimes told him in a fit of short-lived, quickly repented anger that always set him laughing, yet there was never word or gesture that could hint of undue familiarity. It would probably have met a rebuff from the princess part of her; for with a perversity, both royal and feminine, she wanted all the freedom for herself. In short, like any other woman, she would rather love than be loved, that is, until surrender day should come; then of course . . .

After these last two meetings, although the invitations came frequently, none was accepted. Brandon had contrived to have his duties, ostensibly at least, occupy his evenings, and did honestly what his judgment told him was the one thing to do; that is, remained away from a fire that could give no genial warmth, but was sure to burn him to the quick.

The more I saw of this man, the more I respected him, and this curbing of his affections added to my already high esteem. The effort was doubly wise in Brandon's case. Should love with his intense nature reach its height, his recklessness would in turn assert itself, and these two would inevitably try to span the impassable gulf between them, when Brandon, at least, would go down in the attempt. His trouble, however, did not make a mope of him, and he retained a great deal of his brightness and sparkle undimmed by what must have been an ache in his breast. Though he tried, without making it too marked, to see as little of Mary as possible, their meeting once in a while could not be avoided, especially when one of them was always seeking to bring it about. After a time, Mary began to suspect his attempts to avoid her, and she grew cold and distant through pique. Her manner, however, had no effort upon Brandon, who did not, or at least appeared not to notice it. This the girl could not endure, and lacking strength to resist her heart, soon returned to the attack.

(To be continued in the next issue.)

Strengthens Character.

I read this sentence the other day: "Remember that every decision you make either strengthens a little or tears down to a degree your character."

Do you see how true this is? It is like this: A question comes up for quick decision as to whether we should or should not do some certain thing. The first thought with most of us is: "Will it be best for us?" The second should be, if it is not, "Is it best for others?" If the habit is formed to make decisions in the light of justice and fairness the decision is so made and every time we make such decisions our character is strengthened. But if we neglect to consider the rights of others concerned and we take a selfish stand our character is one decision weaker.

All the World's a Stage, and All the Men and Women Merely Players

Oregon Town Controlled by These Women

For the first time in the history of the nation a city administration composed entirely of women will demonstrate to advocates and opponents of woman suffrage "just what women can do."

Already the new administration has announced that their city shall be spotless. Further, they declare it shall also be "policeless" and they have already discharged the members of the city's police department. One interesting feature is the fact that Mrs. Laura Starcher, was elected mayor, defeating her husband by a good round majority.

The photograph, taken during the first meeting of the new mayor and her "cabinet," the name given locally to the newly elected woman council, shows (left to right around the council table), Mrs. Anna Means, councilwoman; Mrs. Florence Brownell, councilwoman; Mrs. Bertha Cheney, recorder; Mrs. Laura Starcher, mayor; Mrs. Stella Paulu and Mrs. Gladys Spinning, councilwomen.

Taking a Bath in the Carpathians

Copyrighted by International Film Service.

Baths are infrequent enough on the fighting lines. These German officers, assigned to the Austrian forces in the snowy Carpathian mountains, are determined to have their bath, and are not at all fussy about hot water. Just plain snow does them very well.

Survives Two Torpedoings.

Some good angel seems to be watching over Captain William T. Turner, who was in command of the Lusitania at the time she was sunk by a German submarine. According to word received in New York, Captain Turner has just survived another torpedoing, that of the transport Ivernia, sunk with a loss of several hundred lives.

After Riding Through Enemy's Line

Photo from Underwood & Underwood, N. Y.

A shot-riddled car in which a score of brave British Tommies rode valiantly through the enemy fire. The soldiers were ordered to make a hurried journey to a point which the censors have deleted.

Becomes U. S. Citizen.

Karl Jorn, a noted tenor of the Metropolitan Opera company of New York, has applied for his "second papers" for naturalization as an American citizen. Some reports have it that Jorn, still a German citizen, was recently ordered to return to Germany to sing at the Royal Opera, others, that he was to be sent to join his regiment.

Science in Pickin' 'Em

LIVE STOCK EXPERT COMES TO RESCUE OF CONTEST EDITOR IN ADVISING LOVELORN YOUNG WOMAN.

The Contest Editor is grateful to V. Van Houten of the V. Van Stock farm, Bellingham, Wash., for a splendid commendation of advice given in this column, January 18, to "Estelle," a perplexed young woman who inquired if she should forgive a lover that made a marriage proposal contingent on her ability to win the $275 prize in the Figure Contest. In commending our advice, Mr. Van Houten says:

"People can get advice on raising calves and mating hogs, but those who can advise on the raising of children and the mating of men and women are too few. The cases are more complicated by far, but there are general principles that should be understood by young people and parents, and special cases can often be helped by a knowledge of the conditions and the dispositions of the ones involved.

A little help to the young people is worth more than a lift to the best pedigreed pig."

Mr. Van Houten also encloses the following letter for transmission to the young woman:

"Estelle:

"My daughter and I read your letter in the Farmer with much interest, and as I have had experience in assisting many young people out of their heart difficulties, I feel deeply concerned lest you turn your very commendable start into an ignominious finish by allowing your kindly disposition and your naturally affectionate nature to reverse the decision you promptly voiced in no uncertain terms when the young man offered his insult.

"It is possible that his beautiful hair has turned his head and that he thought he was offering you a magnificent prize at a bargain counter price. If so, you have shown him that he has been deceived in the goods he has to offer, and it may bring him to a proper realization of what he really is.

"While it is still possible that he loves you, it is almost certain that he loves himself much more fondly than he does you. Your feeling toward him, since he is indifferent toward you, is more one of kindly interest and womanly forgiveness than love. It is that noble trait of the female heart that interests itself in the weak and dependent. You feel that perhaps you are to blame for the state of affairs that exists and your self-denunciation naturally exalts the one whom you fear you have wronged.

"My advice would be that you stand by the beginning you have made. You can best prove yourself worthy of him, or of a better man, by respecting your own womanhood and making him prove himself worthy of you by an apology before you even go with him again, and by a few years of truly manly attention and a willingness to provide a home by his own efforts, before you ever consent to marry him. He should ask you to marry him and share his home with him, rather than offering to let you have a home by his fireside if you would provide the stove and the fuel.

"You might treat him as an acquaintance, if he likes, but it is his place to prove himself a friend before you place him on that basis. A man likes a girl who will meet him half way after he takes the first step, but he is excusable in not respecting a girl very highly if she seems lacking in self-respect. You can be just without being severe, and considerate without loss of principle.

"Win the contest if you can, but do not let him feed his conceit on the prize money. Invest it in Federal Farm Loan Bonds or something safe and good, so that you may have the interest for your own personal fancies or extras that you may want outside of what you can afford from a regular income or a husband's means."

The publication of Estelle's letter has caused the Contest Editor to be swamped with a deluge of mail bulging with poetry and deft disquisitions on the theme of love. The Contest Editor regrets to have created any false impressions of himself as indicated by these letters.

Some sympathize and some excuse, on the grounds of old age, the mild cynicism expressed in our answer to Estelle. Another correspondent calls the Contest Editor a "misogynist." Without looking it up in anybody's dictionary, the other cheek is promptly turned.

We are especially pleased with two soothing expressions done in verse. The first is a poem by Helen Selina Sheridan, sent by some maiden in Mr. Carnegie's library in Spokane, and reads:

Love hath a language for all years—
Fond heiroglyphs, obscure and old—
Wherein the heart reads, writ in tears,
The tale which never has been told.

Love hath his meter, too, to trace
Those bounds which never yet were given,
To measure that which mocks at space,
Is deep as death, as high as heaven.

Love hath his treasure hoards, to pay
True faith, or goodly service done,
Dear priceless nothings, which outweigh
All riches that the sun shines on.

The second, which might be classed as a swan song, from Miss A. M. Willis of Opal City, Ore., attunes like this:

Love buds and blossoms like the flowers in May;
We can be light and free from care while young;
But age steps in and youth soon flies away;
The songs of love have all been sung.

Get Busy Now.

Only six weeks remain of the big figure contest in which this paper is giving away $750 in 32 prizes, the largest to be $275 if the winner has paid $1.50 for three years' subscription to the Farmer.

The advantage of beginning your count now is that should you find your first solution to be wrong, you will have time to send in a corrected solution to the Contest Editor with another subscription payment as provided by the rules. A solution when once entered can not be changed.

Get into the contest now. Don't wait until the close when accuracy may have to be sacrificed to speed on account of lack of time.

This contest is given solely by the Northwest Pacific Farm Trio, which includes The Washington Farmer, The Idaho Farmer and The Oregon Farmer, and must not be confused with the subscription offers of any other newspapers or farm journals. Also remember that this is not a guessing contest.

To enter the Figure Contest it is necessary that you remit a new or renewal of subscription to the Farmer at the regular rate of $1 for one year or $1.50 for three years.

If you are already paid ahead on your subscription to the Farmer, your further subscription payments will be credited on an extension from the time to which you are now paid.

This Is How to Do It

Simply add up the figures in the puzzle chart as if they were in one long column. Your success depends on the accuracy of your total thus obtained.

Figures run from two to nine, and there are no double figures or characters which are not figures. The tail of the "6" has a decided curve, while the tail of the "9" is straight. All other figures have the usual characteristics, allowing no question as to the identity of any figure.

In event that no one submits the correct total, prizes will be awarded for the next nearest solutions.

This contest is restricted to persons residing in Washington, Idaho, Oregon and Montana.

A payment of $1 to $1.50 on subscription to the Farmer entitles the subscriber to enter the contest.

If your subscription is already paid in advance, your expiration date will be set ahead beyond this date to which you are now paid the full period for which you pay at this time. The advantage of paying $1.50 instead of $1 is that the winner of any of the first four prizes receives additional prize dividends apportioned on the amount paid in on subscription, besides the fact that $1.50 during this contest pays for a three-year subscription to the paper, while $1 pays for only one year.

More than one solution may be submitted by any contestant, by an additional subscription payment of not less than $1 nor more than $1.50. It is not necessary to pay the same amount with each solution if more than one is submitted.

You can send in a subscription for some one other than yourself and have the solution registered in your own name. Remember that by paying $1.50 instead of $1 on subscription, the larger will be your dividends if you win one of the four leading prizes; but not more than $1.50 will be received with one solution.

$750-Prizes-$750

FIRST PRIZE, $200,
to which will be added 50 times the amount paid by the subscriber with the winning solution. For example, if you pay $1.50 on subscription, this prize will be worth $275.

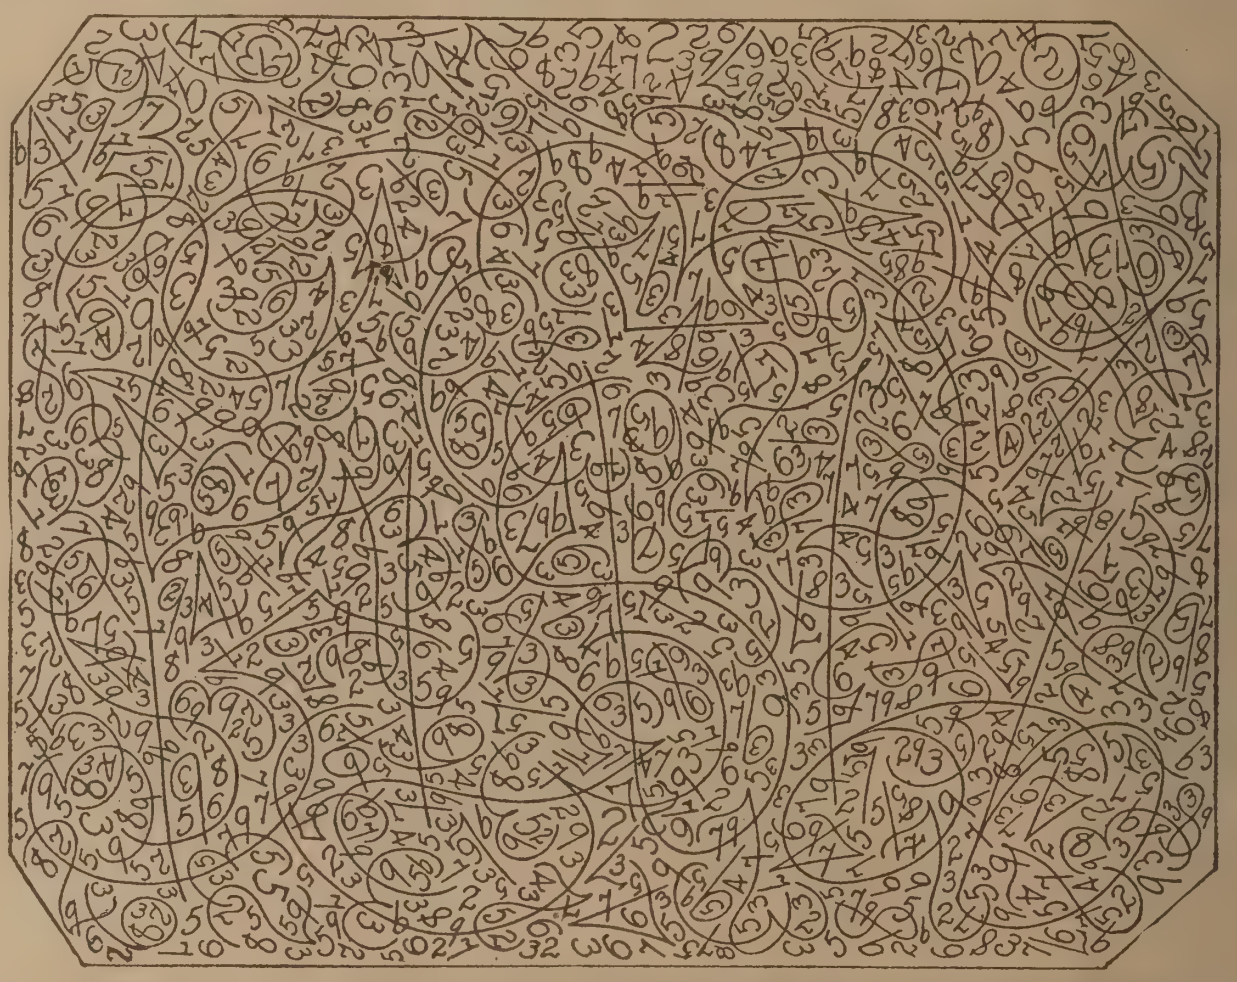
SECOND PRIZE, $100,
to which will be added 30 times the amount paid by the subscriber with the winning solution. This prize may be worth $145.

THIRD PRIZE, $60,
to which will be added 20 times the amount paid by the subscriber with the winning solution. This prize may be worth $90.

FOURTH PRIZE, $50,
to which will be added 10 times the amount paid by the subscriber with the winning solution. This prize may be worth $65.

FIFTH PRIZE, $40.

SIXTH AND SEVENTH PRIZES, Each $20.



EIGHTH TO SIXTEENTH PRIZES, Each $7.

SEVENTEENTH TO THIRTY-SECOND PRIZES, Each $2.

CASH MUST ACCOMPANY.

Don't send in your charts and working papers unless called for by the Contest Editor. Simply write your solution in blank space provided in "Registration Blank."

Remember, the contest closes March 17, 1917.

Valentine

How to Entertain One's Guests

By LAURA PEARSON FELTON.

In giving a party of any kind, three questions confront one: Who to have, what to serve, how to entertain one's guests. I believe the most important question is who to have, as the guests, if rightly chosen, furnish the greater part of the fun. Congenial, happy guests are very necessary to the success of any party. Decorations add to the life of a party, too, as they help to get the guests into the spirit of the occasion, and give the home a festive air.

I bought plain white cards in envelopes to match. On the upper left hand corner of the card I pasted a tiny heart cut from red paper. I wrote my invitation and addressed the envelope with red ink and sealed the envelope by pasting a tiny red heart on the flap.

I decorated the house with strings of tiny red hearts cut from heavy red paper. The shades for the lights were made by fastening three hearts together, forming a cone, which I slipped over the light. This gives a soft, warm glow to the rooms.

Each lady was given a red cap to wear. These caps were made by cutting large hearts out of bristol board. Any heavy red paper could be used. I tied the sides of three hearts together with red baby ribbon and the cap thus formed was worn like a crown, with the apex of one heart coming in the middle of the forehead. These caps, worn with the light colored party frocks, made the ladies look like real valentines, and the bright red caps added to the decoration of the rooms, too. The gentlemen had red hearts pierced by an arrow pinned on their coat lapels.

As I did not have a table large enough to seat all my guests, I made use of an open stairway. I hung strings of hearts on each side of the stairs. Then each step was numbered. The couples were given numbers and a great deal of fun was made finding their seats, to correspond to their numbers. Partners for supper or lunch were found by matching sections of hearts. I cut 10 hearts—as I had 20 guests—from red paper. Each heart was cut into two pieces, no two hearts being cut alike. One half of each heart was given to a lady and the other half to a man. The matching of hearts made a difficult, but an amusing game, as it took some little time to match the irregular shapes.

Contests are apt to prove a bore to some, so I planned only one game or contest. This was a new way of playing the old word building game. "Sides" were chosen and each side given a piece of paper and a pencil. One side had the word VALENTINE, the other the word HEARTS, and they were allowed just five minutes to see which team could write the most words formed from the letters of their word. The winning side was given a box of candy hearts to treat the crowd with. The remainder of the evening was spent in dancing and music.

My refreshments were very simple. I planned them to carry out my color scheme of red. I bought paper plates and pasted a red heart in the center of each and served my lunch on them. A bow of red ribbon was tied to the handle of the glass cup I served the punch in, too. I served stuffed olive sandwiches, tomato salad, frosted cookies and punch. My sandwiches were made by lightly buttering a thin slice of white bread, placing a crisp lettuce leaf on it, then cutting stuffed olives in rings and placing them on the lettuce leaf, spread lightly with salad dressing and covered with another thin slice of bread. I cut the sandwiches in fancy shapes and tied them with red ribbon.

I made the tomato salad by adding a package of gelatine soaked in a half cup of cold water to a quart of hot tomato stock; season well with salt, celery salt, pepper and a little mustard. Pour into little moulds or cups to harden. Serve on a lettuce leaf with a spoonful of salad dressing on top of each mould.

The cookies were plain white sugar cookies frosted with powdered sugar frosting tinted red. I cut the cookies with a heart shaped cutter.

Any fruit punch may be used. I made the foundation of mine of loganberry juice, as it made a red punch. I added a little lemon juice, some orange juice, ice water, sugar and a few candied cherries.

Sport Suit.

"Stitching and big cartridge pockets are the style features of my snappy sport suit," says the New York Herald. "Note that my nifty sport hat is of matching straw."

Always Keeps Ahead.

What is it that the fastest racing automobile in the world can't overtake? It's own running expenses.

Cupid's Day

Fun for a Valentine Party

By EVELYN LEE.

"Fishing for Hearts" makes an excellent diversion at a St. Valentine's social. Secrete some person behind a screen with a basket of hearts for the ladies and another for the gentlemen. Get a pole and line and a bent pin to use as a hook. Then as each fisher throws the line over the screen, let the name of the person be distinctly announced. The paper hearts have various messages. When the heart is fastened the hidden operator jerks the line and the fisher knows he has a bite. Sentiments may be in prose or rhyme such as:

You will marry a woman whose hair is red,
Then often and often you'll wish you were dead.

You'll be a widow and live at your ease
With twelve little children to fret and tease.

You're doomed to endure a bachelor's woes,
To cook your own meals and darn your own hose.

You're doomed to endure an old maid's life,
A sweet-heart to many, but nobody's wife.

In order to create lively merriment each fisher is rigidly required to read aloud his own particular fate or fortune.

Naming Silhouttes.

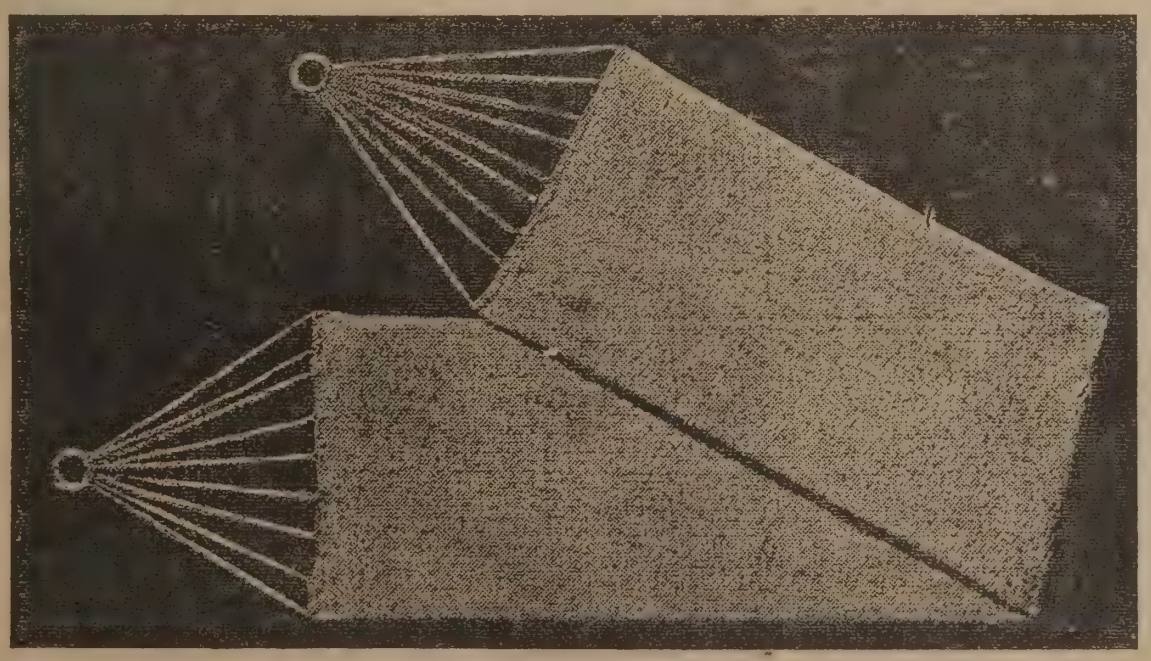
"Naming Silhouettes" is another attractive amusement for February 14. Cut a large heart out of black cloth and sew on a white heart. Then stretch the curtain in a doorway. Place a light a few feet behind the curtain and extinguish the lights in the other room. Distribute cards and let the ladies write the identification of the silhouettes as they appear. Then the men exchange rooms with the ladies who appear one after another before the screen. The cards are graded and the winner announced.

A lot of wholesome laughter will result from a bubble-blowing with soapsuds and clap pipes as accessories. Choose a room with double doors or with three doors if possible. Suspend in each doorway one large heart, or the three hearts may be placed in one doorway. Each person is required to blow a bubble and then drive it with a fan into one of the hearts. He is entitled to try until he does hit a heart. Over each heart a placard with a jingle should be placed. Here are the three fates that await the bubble-blowers:

A woeful fate awaits you here,
You'll be single, I greatly fear.

Number two is the one to take,
You'll be engaged within a week.

Blow your bubble right through here
And you'll be married in just one year.



Shooting Contest.

With an air-rifle and darts one can have a delightful shooting contest indoors. A large board with various pictures pasted upon it should be placed in a conspicuous position. The symbols should be those of St. Valentine. If a girl and a boy hit the same object each becomes the other's valentine for the current year. If two of the same sex shoot the same symbol they will be rivals. Some pictures and their meanings are: Cupid, too many lovers; clasped hands, you will wed within the year; dove, a meek spouse; an arrow, a wounded heart; a blank, not this year.

A basket contest is interesting. Let the players "choose up" as in a spelling match. Distribute red cards to one group and gold cards to the other. Arrange the contestants on opposite sides of the basket, then let them try to toss the cards inside. The group caging the greatest number of goals is the winner of the tournament.

Popular Crochet Designs

By WINNIFRED WORTH

See Saw Back Drier.

This convenient article requires 27 inches Turkish toweling, 16 inches wide. Double the toweling and double crochet both ends. Begin at end, make chain of 39 sts. and fasten by dc. in ring, make 1 more dc. in ring, then ch. 39, sk. 4 dc. in end of drier, fasten by sl. st. in 5th st. Slip st. over 4 dc. and begin another chain until there are 9 chains. Fill ring with dc. Repeat on the other end. The ring must be large enough to allow thumb to go through.

Send 10c in silver or stamps for our up-to-date spring and summer 1917 catalogue, containing 550 designs of ladies', misses' and children's patterns, a concise and comprehensive article on dressmaking, also some points for the needle (illustrating 30 of the various, simple stitches), all valuable hints to the home dressmaker.

Mustard Plaster

So It Will Not Blister the Skin

By ALICE W. BARLAND.

In making a mustard plaster for a lame back, or any like ailment, if the mustard is made into a paste with the white of an egg instead of water the plaster will give the desired heat without causing the skin to blister. I always place a thin cloth over the plaster so the mustard does not come in contact with the skin.

Every housekeeper should try out the comfort of keeping always on hand a package of common court plaster and a bottle of new skin. So often some member of the family cuts or scratches his hand and still must go on with the work. It is such a relief to have at hand just what is needed at the moment. These little articles cost almost nothing, but are worth much in saving nerve strain. Most of us women live at too high a tension because there are so many demands upon us. It has always been so and I doubt not it always will be the same. "Mother" is the one who must fix up the hurts of soul, body and clothing. I am reminded of a remark of my boy one day when he was about 10 years old. He had torn his trousers in what seemed to him a perfectly hopeless way. I mended them to his entire satisfaction. He looked the work over, put on the trousers and looked them over again and said: "Gee, mothers are great institutions!"

Wood Work

Easily Cleaned by Using Coal Oil

What is the most helpful thing you have learned during the past year in your experience with housekeeping? Let us pass it along to other housekeepers.

To the Editor of the Farmer: In cleaning woodwork, especially white, use one tablespoonful of coal oil to one quart of warm water. This does not damage the paint and saves so much time, as it is much more quickly done.

MRS. W. E. CHASE.
Mount Tabor, Ore.

George's Valentine.

Do you remember the valentine
You got when you were a kid!
How the paper lace and the cupids fine
Seemed lovely to your childish mind
As to all the others they did?

There were Annie and Lucy and Annie Hill,
And Susie and Carl and George and Will,
There were Pomp and Meigs and their lister 'Line,
And each sent a Val. to each of the nine.

Only George; and he was so small
That they didn't send any to him at all;
When George's father brought the mail from town
With gay-colored Vals. all weighted down,

And saw none at all for his poor little George.
He wrote one and mailed it; 'twas loving and large;
'Twas blue with lace, and cupids all red,
And a verse on the inside cover said,
"My love for you shall ever flow
Like water down a 'tato row."
So we had to admit, tho' ours were fine
That George had the funniest Valentine.

—Selected.

Fruit Canning

Is a Science, Says C. R. Campbell

Out of over 400 quarts of fruit and vegetables canned last summer and fall by Mr. and Mrs. C. R. Campbell of Bellevue, Wash., not one can was lost. There's a reason, of course.

"Canning fruit to keep is largely a matter of science," Mr. Campbell says. "There are two places where the average housewife is apt to make a mistake. First, in the matter of rubbers. We never use the rubbers which come with the jars, for the reason that they are flimsy and ill adapted to their purpose. And we never use the same rubbers twice. Rubbers are cheap.

"The second point is in reference to tops. Have you ever stopped to think that between the metal top itself and its porcelain lining is a space which is almost certain to become filled with fruit juice during the canning season? Pour a little water into a cover, after it has been apparently rinsed clean, and let it seep in under the lining. Then drain it out and see whether or not it brings the color of fruit juice with it. And then remember that after this juice has dried, it is impossible to get it out, and also that it forms an ideal breeding place for germs."

In meeting this difficulty, Mr. Campbell uses boiling water in which soda is dissolved to rinse the cans just before putting them in place.

Metal Shoes.

Metal shoes, resembling skates, which grip firmly when weight is applied to them, have been invented to enable men to climb steel frames of buildings, bridges and some types of poles.

They wear like iron—

Loving Nieces and Nephews: This is the shortest month of the year, but it has more celebrations in it than any other. Today, in many places, this is Arbor Day. No doubt where many of the Corner children live they see no use in planting trees, since most of the time and work is spent in cutting them down and getting rid of the stumps. And yet think what a desolate place this world would be without trees.

Four days away is Lincoln's birthday. Lincoln loved little children and I think nearly every child that knows of his great and useful life loves him.

February 14 is St. Valentine's day. This is a funny old day, but remember, it is better to be kind than funny.

The birthday of Washington, the father of our country, comes on February 22, and it is a great day. It is quite right to set aside his birthday to celebrate, for it was he more than any other one man, that made it possible for us to have a free country in America.

Arbor day teaches us to do things for others.

Valentine's day is a day of love.

The two birthdays should inspire us to do better things.

Affectionately,
AUNT NELLIE.

GIRLS SERVE HOT LUNCH TO CHILDREN AT SCHOOL

Dear Aunt Nellie: I am going to write to you for the first time. I am 10 years old and my birthday is the 17th of May. I am in the fifth grade. I have a sister and brother. My sister is younger than I and my brother is older. My sister's name is Elma and my brother's name is Rello. We live on a ranch of six acres. I have a pet dog. His name is Teddy. My brother has a pet cow and calf. My father and mother are deaf-mutes. I think that my father and mother will get so they can talk. My father has gone away to work. I am going to tell about our school now. There are four rooms in the whole schoolhouse. There are three classrooms and one cooking room. The girls serve hot lunch at school. There are about 48 children in our school. There are 12 windows in two rooms and 11 in the other room. My teacher's name is Mr. Howell. I like my teacher very much. We have two halls. We have a tennis court and playgrounds. We used to have two swings, but on Hallowe'en night some boys took them down. I would like to correspond with Minnie Ellison.—Dorothy Pierson, Freeland, Wash.

PUPPY BARKS AT EVERY ONE WHO COMES INTO THE YARD

Dear Aunt Nellie: I like to read the Farmer and especially the Children's Corner. I have some girl friends who have written. I read the Farmer every time it comes. I live about a mile from school. I am in the sixth grade and am 11 years old. There are about 44 pupils in my room and there are eight rooms in the building. We have a large gymnasium and we have picture shows every Friday. We also have a large high school. We have two horses and a colt. The colt is about 8 months old. His name is Dick. My brother has a puppy that barks at everybody that comes in the yard. Every morning I help mama with the dishes before I go to school. I start about 15 minutes after eight for school. I haven't been late or absent for one year and hope I won't be this year either. I almost forgot about the cows. We have eight milking cows and three calves. We also have one little bull calf. I wish that some one would write to me soon because I get very few letters.—Bertha Gamble, Bothwell, Wash.

VERA ENJOYS READING THE COUSINS' LETTERS

Dear Aunt Nellie: This is the first time I have written to the Children's Corner. We take the Farmer, and I enjoy reading the letters of your nieces and nephews very much. I think Inez Gagen wrote a very interesting letter about her trip back east. I am a girl 13 years old. My birthday is October 14. Have I a twin? I would like to correspond with any girl of my own age. I live on a farm of 160 acres. We have seven horses and five head of cattle. The horses' names are Buck, Pinto, Nan, Carrie, Jack, Frank and Pansy. The cows' names are Buttercup, Molly, Josephine, Blossom and Bill. We have a dog. His name is Ring. We have six cats, three little kittens and three old ones. Also four pigs and a nice flock of turkeys and chickens. I have three brothers and two sisters. Their names are Percy, Preston, Robert, Irma and Jennie, who is a sweet little baby 13 months old.

I go to the Valley school and am in the seventh grade. I have two miles to go, and I walk. My teacher's name is Mrs. Mary L. Whiteside.—Vera V. Gensel, Aeneas, Wash.

STARTED A BANK ACCOUNT WITH HIS RABBIT MONEY

Dear Aunt Nellie: I am 8 years old. My birthday is August 13. I go to the Ocks school. I drive three and a half miles to school every morning. My pony's name is Billie. There are 12 children in our school, six boys and six girls. Our teacher's name is Mabel Snyder. I am in the second grade. I will tell you about my pet rabbits. They are white as snow, with pink eyes. Last summer I sold 15 rabbits at $1 a pair and I made $7.50, with which I started a bank account. When I get enough money together I am going to buy me a nice big colt.—Charles J. Maurer, Mohler, Wash.

THINK HOME IS BEST EVER; THEY HAVE LOTS OF FUN

Dear Aunt Nellie: I am 10 years old and my birthday is December 18. I have three brothers and three sisters. We live on an 80-acre farm. We will have 21 cows to milk this summer. We have two horses, one pig, and one little white dog that my brother and sister like very much. We have 50 hens. We think our home is the best ever for we have lots of fun. There are 24 pupils in our school. My teachers name is Mrs. Look. I like her very much. I would like to become a member of the Children's corner.—Ruth Johnston, Bow, Wash.

HAVE LOTS OF FLOWERS, FOR PAPA IS A FLORIST

Dear Aunt Nellie: This is the first time I have written to the Children's Corner. I am 9 years old. My birthday is on the 25th of December. My father is a florist and sometimes I help him plant little plants. We have a great many flowers as father is the only florist in Kent. The flowers I like best are lilies of the valley and violets. I am the only child in the family. I am in the third grade at school. My teacher's name is Mrs. Snell.—Rosa Sanli, 509 Harrison street, Kent, Wash.

HAVE TWO PONIES, CALL THEM LADY AND PRINCE

Dear Aunt Nellie: This is the first time I have written to the Children's Corner, and I hope it will not be the last. I am 11 years old, and in the sixth grade. My birthday is the 25th of August. My teacher's name is Miss Flora Jean English. I think she is a very good teacher. I live a half mile from the school. There are about 28 scholars in the school. Our schoolhouse has only one room. I have two sisters and one brother. My sister's names are Dorothy and Fay, and my brother's name is Warren. We have two Shetland ponies. They are spotted, sorrel and white. Their names are Lady and Prince. We have 22 other horses. One is a sorrel pony named Topsy. We have six cows. My cow's name is Tiny. The other cows' names are Lissy, Pansy, Daisy, Midget and Bonny. I can ride my cow; in the summer I ride her to pasture. We have about 30 rabbits. I have a little black rabbit that I caught when it was very little. I fed it until now; it is large. I live about five and one-half miles from Colfax, and love to live in the country very much. I live on an 880-acre farm. My papa takes The Washington Farmer and the first place I turn to is the Children's Corner.—Elsie Wiseman, Colfax, Wash.

LILLIAN GOT A BEAUTIFUL, BIG DOLL FOR CHRISTMAS

Dear Aunt Nellie: I was the first one to go and get the mail yesterday down to the mail box to see if The Farmer came, and when I saw my name in the Children's Corner, I was so glad, and mamma was, too. I had a jolly time Christmas. My brother got me a beautiful doll, 29 inches long, and as big as a two-months-old baby. She has real hair (curly) and real eyelashes, four teeth and has the cutest fingers and toes. I like to sew, so I have made two or three dresses already. Mamma got me a hair ribbon and a friend of mine gave me a big box of chocolates. I love to read the children's letters very much. I can tat, crochet and embroider. My brother Richard has the measles.—Lillian A. Motton, Route 2, Box 49, Friday Harbor, Wash.

ALICE LOVES TO HELP MOTHER WITH THE WORK

Dear Aunt Nellie: I have been reading the Children's Corner and I think it is real nice. I am 11 years old and am a great help to mother. I like to help mother work. Sometimes my little sister and I get up and get breakfast almost ready and then the rest get up. Mama helps us finish getting breakfast ready. I make real nice bread. At night when mama and I get supper over and all the dishes washed, we read in some books or papers.—Alice Miller, Box 63, Mayview, Wash.

WELCOME TO OUR CLUB, LITTLE BLUE-EYED GIRL

Dear Aunt Nellie: I would like to belond to your club. I am 10 years old and am in the fifth grade. I have light hair and blue eyes. I live on a farm of 40 acres. We have two horses, seven cows and three heifers. I have two pets. One is a black and white kitten and the other is a heifer. I have a little sister 3 years old. She has light brown hair and blue eyes. I also have another sister and a brother. I live half a mile from our school. My teacher's name is Miss Hazel Chandler. We have two rooms. All of the children below the sixth grade are in one room and the children from the sixth grade up to the tenth are in the other room. If I pass this year I will be changed into that room.—Lenore Fox, R. F. D. No. 1, Washougal, Wash.

LIKES TO HELP MOTHER SO SHE IS PIECING QUILTS

Dear Aunt Nellie: I have read the letter to the Children's Corner for a long time, but I never wrote before. I am 10 years old. I passed into the fifth grade last year, but I have been sick with curvature of the spine, so I could not go to school this year. I have two brothers and two sisters. I like to help my mamma, and as I can't walk around or lift anything heavy, I am helping her by piecing quilts. I wonder if any of the cousins have any pieces of calico, gingham or outing left from thin school dresses, that they would send me to put in my school quilt. Mamma says that if I am very, very careful with my stitches, she will let me take it to the fair next fall.—Leone Waldron, Clinton, Wash., R. F. D. Box 18A.

GIRLS HAVE BALL TEAM; PRACTICE IN SCHOOL GYM

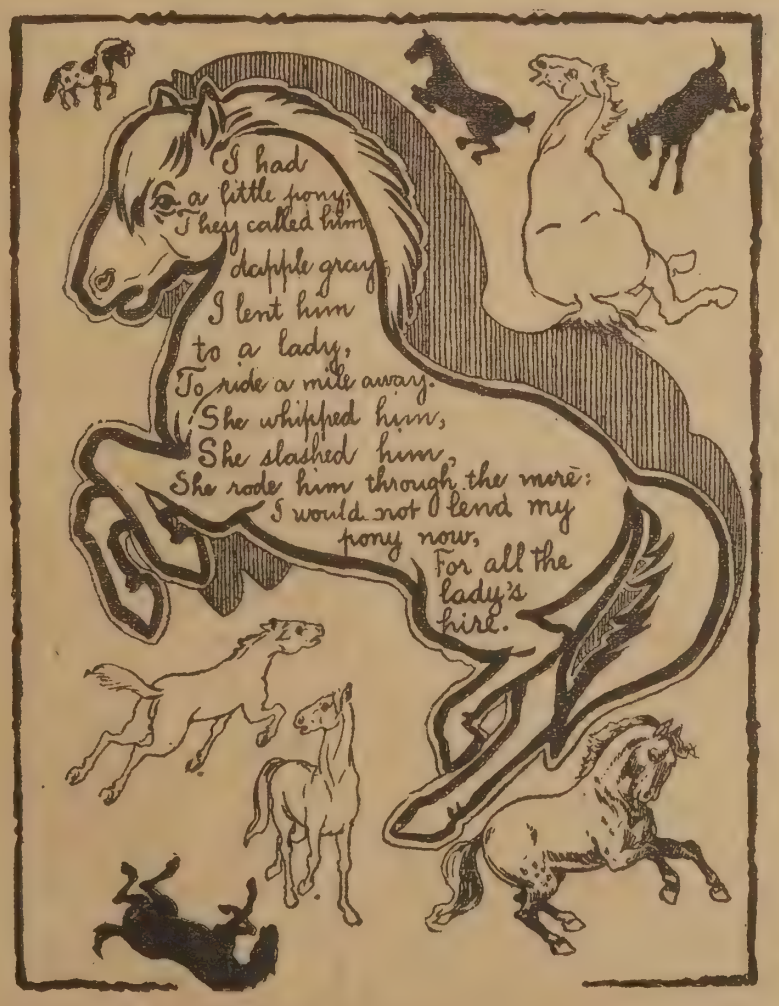
My dear Aunt Nellie: I have been reading so much lately in the Children's Corner that I thought I would like to see my name printed. I live about one and one-half miles from Johnson, Wash. I am 13 years old and my birthday is on September 21. I am in the eighth grade, and it is not more than two weeks until we have our mid-year exams, although we are just having our Christmas vacation. We have a large gym at school and we girls have a team. We practice every other day.—Myrtle Sodorff, Box 62, Johnson, Wash.

READS EVERY LETTER THAT SHE SEES IN THE CORNER

Dear Aunt Nellie: I have read every letter that I have seen in the Farmer. We have 10 head of cattle. We have 22 pigs altogether, three big ones and 19 little ones. 75 chickens and two horses. We live on a 52-acre farm. I have three pets, two cats and one dog. The dog's name is Tom. He's black and white. I'm 10 years old and in the fourth grade. There are 22 pupils in the third grade, and 20 in the fourth grade. My teacher's name is Miss Hinkly. My birthday is in August.—Waldemar Johnson, R. F. D. 2, Box 3, Rochester, Wash.

WATCHED FOR HALF A YEAR, BUT DIDN'T FIND A TWIN

Dear Aunt Nellie: I would like to become a member of the Children's Corner. We have two dogs, two white cats, one goat, 50 chickens and 18 head of cattle and two horses. I am 13 years old. My birthday is August 26. My brother is six years older than I am. I have watched the Farmer for one-half year, but I did not find a twin. I can crochet and tat, and skate.—Albertha Capaan, R. F. D. 2, Box 37, Oak Harbor, Wash.



THE COUSINS ARE GLAD TO HAVE LOIS WRITE

Dear Aunt Nellie: I am 9 years old and in the third grade. My teacher's name is Miss English. I have two rabbits, one is brown and white and the other is black with some white on it. We have six cows. One is mine; it is a calf. I will close for fear of the waste basket.—Lois Fay Wiseman, Colfax, Wash.

EDNA RIDES HER PET HORSE TO TOWN ALONE

Dear Aunt Nellie: This is the first time I have ever written to the Children's Corner, but I read the letters and like them very much. I am going to write. I am 8 years old and live on a 160-acre farm. I have a pet horse. Her name is Maude. I ride her to town myself.—Edna Smith, Riverside, Wash.

My Little Pony

Grain and Produce Markets

Chicago Grain.

CHICAGO, Feb. 3.—Wheat prices shot skyward today after a downplunge of 6 cents. The rise following amounted to 14 cents, the greatest change values have shown in a single day since the beginning of the European war. Excited buying on the part of speculators who had overestimated the depressing effect of a severance of American relations with Germany was chiefly responsible.

The close was wild in wheat at $1.67 7-8 to $1.68 3-8 for May, and $1.47 3-4 to $1.48 1-8 for July, with last trading as a whole 3 3-8c to 7 5-8c above yesterday's finish. Corn wound up at a net advance of 1c to 1 1-2c, and oats with a gain of 5-8c to 1c. In provisions the result varied from 7c decline to a rise of 5c.

Some bullish sentiment was engendered by assertions that with the navies of England, France and the United States patrolling the ocean, shipping would be facilitatel rather than hampered.

Corn and oats, like wheat, displayed temporary acute weakness in response to the news of the diplomatic rupture with Germany.

Provisions gave way as much as 57c in some cases owing to the disclosure of the stand taken by the government at Washington. In the end though the market averaged exactly the same as before relations with Germany were cut.

Pacific Northwest Grain.

PORTLAND, Ore., Feb. 3.—Wheat—Firmer; no trading. Spot bids, 3 to 5 cents higher. Bluestem, $1.50; forty-fold, $1.48; club, $1.46; red Russian, $1.43.

Barley—Higher. No. 1 feed, $38.50.

SEATTLE, Feb. 3.—Wheat—Bluestem, $1.49; Turkey red, $1.48; forty-fold, $1.46; club, $1.46; fife, $1.46; red Russian, $1.43.

Barley, $38 per ton.

WILBUR, Wash., Feb. 3.—Bluestem, $1.30; club, $1.25. Oats, $37. Barley, $37. No sales are reported.

San Francisco Grain.

SAN FRANCISCO, Feb. 3.—Wheat—Firm; no trading.

Barley—May, $2.28 1-2b, $2.30a; December, $1.60b; February, $2.22 1-2b.

Minneapolis Grain.

MINNEAPOLIS, Feb. 3.—Wheat slumped 6 cents, but later swung upward. Corn and oats swayed in sympathy. Wheat receipts, eight cars, compared with 287 a year ago.

May wheat opened $1.65 to $1.65⅝; high, $1.72¼; low, $1.59⅞; closed, $1.71¾@1.71⅝.

July opened $1.62⅝@1.62¾; high, $1.69½; low, $1.58; closed, $1.69½.

Cash wheat—No. 1 hard, $1.79¾@1.81¾; No. 1 northern, $1.72¾@1.75¾; to arrive, $1.71¾@1.73¾; No. 2 northern, $1.69¾@1.75¾; No. 3 wheat, $1.59¼@1.71¾; No. 2 durum, $1.76½@1.89½; No. 2 hard Montana, $1.71¾@1.73¾.

Corn—No. 3 yellow 94¾@95¾c.

Oats—No. 3 white, 51¼@52¼c.

Flax, $2.87@2.93.

Flour—Unchanged; shipments, 40,565 barrels. Barley, 85c@$1.17.

Rye, $1.35@1.36. Bran, $31@31.50.

Car Receipts at Coast Points.

Receipts of grain and hay in car lots at Coast points for the fiscal year beginning July 1 up to Saturday night for 1916-17 and 15-16 were as follows:

Seattle—	Wheat.	Oats.	Barley.	Hay.
1916-17	3,889	842	285	2,739
1915-16	6,534	760	1,110	2,970
Portland—				
1916-17	3,750	1,686	149	1,575
1915-16	9,156	822	1,330	1,539
Total—				
1916-17	7,637	2,523	434	4,314
1915-16	15,690	1,572	2,490	3,509

Seattle Wheat.

SEATTLE, Feb. 3.—The break of 11 cents per bushel following the latest ultimatum on shipping by Germany did not produce the selling rush that prevailed in the east, but rather induced the Washington farmer, who is not friendly to such a move, to more closely clutch the grain he had on hand.

Long inured to the views of Washington grain growers, millers did not expect that their declining bids would bring forth any wheat, and their slate to that extent held intact. Bid prices in the country showed more of a weakness than in the open market, where a spread of only 11 cents predicated on the previous day was effected. The bulk of what remained of Washington wheat was sold last week and the week previous up to $1.60. The best that millers would offer for bluestem and turkey red was $1.35.

Since the Washington wheat trade has been on a world basis the activities that influence prices in all parts of the world are being carefully weighed without partizanship, feeling or a desire to prophesy. It is assumed by dealers that Europe has for some time been expecting the last move by Germany, and the neutral countries now involved in the conflict prepared for it by laying in ample stocks of grain. In a word, many seasoned traders here feel that before the next harvest the war will be over and the serried ranks returned to peaceful pursuits. Wheat futures run more logically and pointedly now to conditions after the war than at any time during the last year.

One of the problems of the future is whether the winter wheat of the country is seriously damaged. Millers say little has been planted in this state due to dry fall weather. On the prospect that the new crop will be high millers report sales of September wheat at $1.10 and $1.50, although both sales were in small lots.

The flour market declined 20c per barrel before the date of the German announcement, but has remained stationary through the balance of the week, riding down the excitement of Thursday.

Portland Wheat.

PORTLAND, Ore., Feb. 3.—The wheat market was firmer at the close of the week with the advance at Chicago, but trade was inactive. Dealers were not disposed either to buy or sell freely in view of the uncertainties. Some of them, however, take a bullish view of the situation and predict the highest prices of the year unless the government steps in and takes control of the supply. As stocks in this country are now dangerously low there is fear in some quarters that this may occur. In the meantime farmers are not offering their grain on the market.

Closing prices at the merchants' exchange for February delivery were: Bluestem, $1.50; forty-fold, $1.48; club, $1.46; red Russian, $1.43. March prices were 1 to 2 cents higher than February.

Oats and barley were easy in the latter part of the week, but firmed up at the close. Both lines were dull. Practically no business is passing in the flour market, either for local or eastern account. Hay continues depressed owing to large stocks on the track here.

Seattle Market.

SEATTLE, Feb. 3.—The local ranch egg market broke sharply today and practically during the entire day quotations were in a downward condition. First sales were at 38c. A fall to 37c and then to 36c, with declining bids to producers, which carried them to 30c, followed the arrival of continued spring weather and a large lot of Petaluma eggs.

The butter market is easier in spots today, due principally to sentiment from warm weather. The cream supply has not increased, and California butter costs too much money at shipping points to bring in here. The condensaries have begun the manufacture of butter. Due to war conditions, jobbers believe the export trade in condensed milk will decline in volume from now on.

Cheese is stronger. Brisk selling is expected during the latter part of this month.

Wool.

BOSTON, Feb. 2.—The Commercial Bulletin will say tomorrow:

"The last week brought increased activity in the wool trade, and the German note has certainly not weakened the situation. On the whole this latest international development would seem to be a further element of strength. Most of the activity of the week has been in scoured wools suitable for woolen mills which show advanced prices, but the worsted interests have not been altogether idle."

Scoured basis: Texas fine, 12 months, $1.05@1.10; fine eight months, 88@90c.

California, northern, $1.05; middle county, 90@95c; southern, 70@75c.

Oregon, eastern No. 1, staple, $1.10@1.15; eastern clothing, 98c@$1; valley, No. 1, 92@95c.

Territory, fine staple, $1.20@1.25; half blood combing, $1.10; 3-8 blood combing, 85@88c; fine clothing, 95c@$1; fine medium clothing, 92@95c.

Pulled, extra, $1.05@1.10; fine A, 98c@$1; AA, 90@95c; A supers, 83@85c.

Butter, Eggs, Cheese.

CHICAGO, Feb. 3.—Butter—Unchanged; receipts, 6210 tubs.

Eggs—Lower; receipts, 4662 cases. Firsts, 42@42½c; ordinary firsts, 40@41c; at mark, cases included, 40@42c.

SAN FRANCISCO, Feb. 3.—Butter—Fresh extra, 41½c; prime first, 40c.

Eggs—Fresh extras, 36½c; pullets, 33c.

Cheese—Young Americas, 21½c.

ELGIN, Ill., Feb. 3.—Butter—Fifty-five tubs sold at 39c.

Portland Market.

PORTLAND, Ore., Feb. 3.—The shortage in butter has become acute. Storage stocks are reduced to the poorest grades and the supply of cream is now at the minimum. As Seattle and San Francisco markets are high, Portland creamery men have been forced to advance prices another cent. The buying price of butterfat has been raised 2 cents.

Eggs have sagged under large receipts to the 30-cent mark. It is thought this price will attract outside buying and check the decline.

Five cars of Tillamook cheese were shipped east in the past week and a Canadian order for 1000 cases was received by a local firm. The market is strong, but the factories fear an advance would stop local buying, by putting cheese out of the 25-cent retail class.

In the following list of quotations the grain, hay, millfeed, hop, wool and hide prices are those paid to producers. The other quotations are prices from jobbers to retailers:

Oats—No. 1, $34.50@35.50 per ton.

Corn—Whole, $47; cracked, $48 per ton.

Millstuffs—Bran, $26.50 per ton; shorts, $30.50.

Barley—No. 1 feed, $38@39; brewing, nominal; rolled, $42@43.

Hay—Buying prices. Timothy, eastern Oregon, $19@20; alfalfa, $15@16; clover, $11; grain, $12@13.

Eggs—Oregon ranch, case count, 30@31c per dozen; candled, 32@35c.

Poultry—Hens, 17@18c; ducks, 18@20c; turkeys, live, 18@20c; dressed, 22@25c; geese, 12@14c.

Butter—City creamery, prints, 42@44c per pound; cubes, 40c.

Cheese—Oregon triplets, 20c; Young Americas, not quoted.

Dressed meats — Veal, 14@14½c; pork, 13@13½c.

Hops—1916 crop, 5@9c.

Potatoes—Oregon, jobbing price, $2.50@2.75 per cwt.

Onions—Buying price, $6 for country points.

Wool—Eastern Oregon, fine, 28@33c; coarse, 33@36c; valley, 35@41c.

Beans—Small white, 11 1-4c; large white, $11.10 per 100 pounds.

Hides—Salted hides (25c lbs. and up), 18c; salted stags (50 lbs. and up), 14c; green and salted kip (15 lbs. to 25 lbs.), 18c; green and salted calfskins (up to 15 lbs.), 27@28c; green hides (25 lbs. and up), 17c; green stags (50 lbs. and up), 13c; dry hides, 30c; dry salt hides, 25c; dry horse hides, $1 to $2; salt horse hides, $3 to $5.

Spokane Market.

The wholesale prices quoted in the list below are not the prices paid to producers or shippers; they are those charged by the Spokane commission houses to the retail trade for standard produce. The prices quoted for live stock, however, are the prices given to the producer:

Potatoes—Potatoes, $2.25@2.50 cwt; sweet potatoes, $6

Apples—Washington apples, cooking, 60@85c; eating, $1@1.25; Wageners, 85c@$1.35 box; Jonathans, $1.25@1.35 box; Delicious, large, $1.75@2.25 box; Rome Beauties, $1.25 box; Winesaps, $1.75@2 box; Y. N. Pippins, $1.75@2 box.

Butter—Blanchard cartons, 40c lb; Medo-Maid, 40c lb; Cascade, 40c lb; Gold Coin, 36c lb; Gold Leaf, 40c lb; Better Butter, 40c lb; Hazelwood, 40c lb; Peerless, 38c lb; Jersey Belle, 39c lb; Attalia, 40c lb; Diadem, 40c lb; Jersey, 38c lb.

Cheese—Wisconsin full cream, twins, 28c; triplets, 28½c; Hazelwood full cream triplets, 22c lb; Hazelwood Young America, 24c lb; Wisconsin limburger, 29c lb; brick cheese, 28c lb; domestic Swiss, 33c lb; Young Americas, 26c lb.

Eggs—Fresh local ranch eggs, $12@14; fresh eastern eggs, $12 case; eastern storage eggs, $10.50 case.

Live Poultry—Springs, 14c lb; hens, 13@14c lb; old roosters, 6@7c lb; ducks, 11@13c lb; turkeys, 20@27c.

Dressed Poultry—Hens, 17c lb; springers, 17c; old roosters, 10c; ducks, 16c; geese, 14c; turkeys, 28c.

Hide Quotations.

Green cows and steers—25 lbs. and up, 16½c; salted cured, 19c; green bulls and stags, 13c; salted cured, 15c; kip, 15 lbs. to 25 lbs., 21c; calf skins up to 15 lbs., 30c; dry flint hides, 32c; dry salted, 27c; dry calf skins, under seven lbs., 38c; dry sheep pelts, full wooled, 20@23c; dry shearlings, 75c each; green horse hides, $3 to $5 each; dry horse hides, $1 to $2 each.

WORK ON BIG DAM

Four Years and $2,000,000 Cost.

C. E. Crownover, manager of storage construction for the Yakima irrigation project, has moved his office from Lake Keechelus to North Yakima, where he will direct the building of a dam costing $2,000,000, at McAllister Meadows. The work will continue for four years. The first year will be given over to the building of camps, storehouses, shops, offices, mess houses and other equipment for handling the work. The government expects to employ 500 to 600 men during the construction season.

Live Stock Quotations.

At Chicago.

CHICAGO, Feb. 3.—Hogs—Receipts 8000; strong, 5c to 10c above yesterday's average. Bulk, $11.70@11.90, light, $11.25@11.85; mixed, $11.35@12; heavy, $11.40@12; rough, $11.40@11.55; pigs, $9.25@10.50.

Cattle—Receipts, 100; steady. Native beef cattle, $7.75@12; western steers, $7.75@10.15; stockers and feeders, $6@9.10; cows and heifers, $5@10.25; calves, $10@14.

Sheep—Receipts, 1000; strong. Wethers, $10.40@11.75; lambs, $12@14.65.

At St. Paul.

SOUTH ST. PAUL, Feb. 3.—Estimated receipts at the union stock yards today: Cattle, 118; hogs, 145; sheep, 6.

Cattle—The trade during the week has been on a somewhat more normal basis than last week. Trade today was negligible.

Hogs—Hardly enough stuff to make a hog market arrived here today. The two bunches which were sold cashed at $11.35, yesterday's top, reflecting a steady market. The week closed with prices 15c to 20c higher than at the close last week. Receipts have been very light, on account of weather conditions.

Sheep—Steady prices were paid for everything sold. For the week trade in the sheep house has been fairly good at steady to strong prices.

At Portland.

PORTLAND, Ore., Feb. 3.—Hogs—Steady; receipts, 234. Bulk of packing grades, 11.30@11.35; heavy packing, $11.35@11.40; light packing, $11.30@11.35; rough heavies, $10.15@10.35; pigs and skips, $10@10.50; stock hogs, $8.50@10.

Cattle—Steady; receipts, 8. Steers, prime light, $8.50@8.75; prime heavy, $8.75@9; good, $8@8.40; cows, choice, $7.50@7.75; medium to good, $7@7.25; ordinary to fair, $6@6.75; heifers, $4@7.50; bulls, $3.50@5.50; calves, $6@8.

Sheep—Steady; receipts, 7. Lambs, east of mountains, $12@12.25; lambs, valley, $11.50@11.75; lambs, good, $11@11.50; choice yearling wethers, $10@10.50; good yearlings, $9.75@10; choice ewes, $9@9.25; heavy ewes, $8.50@8.75.

At Seattle.

SEATTLE, Feb. 3.—Receipts, 409 hogs; market steady.

Hogs—Prime light, $11.80; medium to choice, $10.55@10.85; smooth heavy, $10.30@10.75; rough heavy, $9.45@10.15; pigs, under 150 lbs., $8.50@9.15.

Cattle—Prime light steers, $9; medium to choice, $8.25@8.50; common to good, $6.50@7.75; medium to choice, $7@7.25; common to good, $5@6.50; best bulls, $5@5.75; common bulls, $3.50@4.50; calves, $7@9.

Sheep—Prime lambs, $10.25@10.50; good lambs, $9.75@10; wethers, $8.50@9; ewes, $6.50@8.

Spokane Stock Yards Saturday.

Hogs—Receipts, none; market strong. Prime heavy, $11.55@11.60; prime light, $11.30@11.35; prime mixed, $10.40@11; rough heavy, 10@10.50; stockers, $7@8.75.

Cattle—Receipts, 30; market strong. Prime heavy steers, $9; prime light steers, $8.50@8.75; good steers, $8@8.50; stockers and feeders, $5.50@6.50; prime cows, $7.25@7.75; good cows, $6.50@7; best heifers, $7@7.75; bulls, $3.50@6; calves, $6.50@9.

Sheep—Receipts, none; market strong. Prime lambs, $11.50@12; common lambs, $10.50@11; best yearlings, $9.75@10.50; good yearlings, $8@9; best mutton ewes, $7.75@8.25; common ewes, $6.50@7.50.

Potatoes at $3.

Harry E. Mullen, a farmer living on the South Santiam river, near Albany, Ore., received $3 a hundredweight for 400 bushels of potatoes. The potatoes were from choice stock and of exceptional quality.

Cooperative Creamery Elects.

Sunnyside Cooperative creamery of Sunnyside, Wash., at its recent annual meeting relected the old board by acclamation. The annual reports shows the sales of butter to be $13,921 more than that of the preceding year. Sixty-five members and patrons sat at the banquet table at the Litchy cafe.

Who Fill Our Pulpits?

According to statistical reports recently compiled from the various colleges, it is found 33 per cent of our ministers come from rural homes.

NORTHERN PACIFIC RAILWAY LANDS in eastern Montana at $2.50 to $18 per a. Suitable for farming or grazing. Easy terms. For information write or see W. E. HOLT, MILES CITY, MONT.

FARM LANDS—FOR SALE 651 Continued.

WHY GO TO MONTANA OR CANADA WHEN YOU CAN BUY BETTER WHEAT LAND IN WASHINGTON FOR $20 PER ACRE? EASY TERMS.

720 acres, or will divide into smaller farms. This land is in the famous Waterville-Mansfield district, where there is plenty of water and moisture and the soil is a good, dark loam, with a clay subsoil; produces 30 to 40 bushels of wheat per acre; part of it is in cultivation, and practically all tillable; it lies close to the railroad and near a good town where there are good schools, churches, stores and other conveniences. The climate is excellent, and plowing can be under way very early in the spring. No severe winters to combat. This section of the country produces a very hard wheat, which commands the top price. We can sell this land for ¼ down and the balance a long time, at 6 per cent. Did you ever hear of anything better?
ARTHUR D. JONES & CO., SPOKANE.
ARTHUR D. JONES BLDG.

MONTANA GRAIN AND STOCK FARMS IN Shields River valley, Judith Basin and Great Falls district. Good land for stock-raising, $7 to $15 per acre; grain land, $20 to $40 per acre; small cash payment, balance easy terms, at 6 per cent. Several good farms, with one-fourth or more in crop. Can take some good property as part payment on quite a number of good Montana farms. Call or write for Montana land list. HEGE & SCHIFFNER CO., 715-17 PAULSEN BLDG., SPOKANE.

BARGAINS IN FARM LAND.

Our business is loaning money on farm and city property. Occasionally we have properties for sale which have come into our possession on account of foreclosure of loans. These we offer at practically the net cost to us, which is far below their real value; a small payment down, the balance on easy terms, with low rates of interest. Send for list.
THE PENNSYLVANIA MORTGE. INV. CO.
BOX 6, SPOKANE, WASH.

Want to exchange this for a good house and few acres close to Spokane. Price, with stock, $4500; without stock, $3700.

All kinds of city property to exchange for land. If you have the land, write us at once.

J. MELVIN THOMAS & CO.
214 EXCHANGE BANK, SPOKANE.

NEWS FOR BREEDERS

Guernsey Cattle

Show Great Increase in America

On examining the work carried out during the last working year of the American Guernsey Cattle club, ended April 29, 1916, one fully realizes the progress accomplished in the development of this dairy breed in the United States, and, above all, the continuous increase in the average production as it appears from the Advanced Register. The register of bulls contains 37,862 head, and that of cows 63,954 head, making a total of 101,816. Five years ago there were only 44,286 animals registered, which shows that during the last five-year period the Herd Register exhibited an increase of 130 per cent.—London Live Stock Journal.

NEWMO, ANGORA BUCK.

Long-fleeced Angora buck, owned by U. S. Grant, Dallas, Ore., 22 months old, and had never been sheared when photo was taken. The fleece was 22½ inches long.

WANT STATE PREMIUMS.

The Oregon State Purebred Live Stock association in a recent meeting adopted a resolution asking the legislature to appropriate $20,000 to be used as premiums at the state fairs and shows for live stock and poultry.

BUYS HEREFORD BULLS.

James Just of Presto, Idaho, has purchased from the Kennedy farm of Blackfoot two Hereford bulls coming two years old. It is reported that the price paid was $300 each.

TO MISSOURI FOR MULES.

S. Kent, D. C. Keith and J. J. Peak have gone from Davenport to Kansas City and will probably return with a large consignment of Missouri mules, for use in Lincoln county.

Draft Horses

Plain Gelding Sold for $275

There is a revival of the demand for horses. This is shown by the keenness with which farmers are now buying work horses for spring use. That ranchers should undertake their wintering on $36 oats and $16 alfalfa hay is conclusive evidence of the anticipated dearth of desirable material. Professor William Hislop, animal husbandman of the state experiment station at Pullman, reports a recent sale of a plain gelding, coming four years, weighing 1525 pounds, at $275 cash. This figure would have been quite ordinary had it been paid for a drafty individual with clean limbs and snappy action. The above transaction is typical of many others.

Thousands of horses have left our state on war contracts. That, in part, explains the scarcity in desirable equine stocks, but the root of the matter lies in the steadily decadent interest manifested by farmers in horse raising.

The present relation between supply and demand should inject strength into the draft horse business. The trade is demanding a bigger horse with more quality and action and to that end farmers owning mares hold the key.

During the coming breeding season, the latter should manifest more discrimination toward the patronage of stallions. They should not fail to realize that stud horses capable of being good sires are scarcer and more costly since the European war broke out two and a half years ago. Stallion owners will therefore be justified in demanding higher service fees so as to ensure reasonable returns on the investment.

The adoption of mare owners of a more liberal fee policy will attract a higher class of stallions, which in turn, will mean more effectual draft horse service. Let it be said without equivocation that the scrub is costly if the fee is ever so low and so long as he is available there is little inducement to invest in a first class stallion.

Unfaltering patronage of the high class sires will automatically drive the nondescript breeding horse from your community, a service which every one will welcome.

Sale of Percherons.

A dozen percheron horses were sold at the John Rauter place, near Warden, Grant county, Wash., nearly all bringing $200 or more.

Pioneer Breeder of Shorthorns

A. Chalmers of Forest Grove, Ore., proprietor of Fork Branch farm, has been breeding Shorthorns continuously longer than any other man in Oregon. Mr. Chalmers is a Scotchman, and, like so many others of that nationality, takes to the breeding of purebred live stock, apparently as if it were a part of nature's scheme. His father was a Shorthorn breeder on the "auld sod," and during his boyhood days, Mr. Chalmers was fortunate in making frequent visits to the home of the famous breeder, Amos Cruikshank, with whom his father was on terms of intimate friendship. His first Shorthorns were purchased in 1886, and through hard times or good times, high or low prices of grain, hay or cattle, Mr. Chalmers has bred Shorthorns.

Scottish Flower 3d, Shorthorn.

Mr. Chalmers' early purchases contained Cruikshank blood, and he still regards that line of breeding as among the best obtainable. His first purchase, Mignonette, was an inbred Governor General, and Mr. Chalmers describes her as having, like her sire, "a strong, smooth front and well-let-down hindquarters, and as fine a looking udder and teats as were ever put on a cow." She proved to be all he expected as a milker, and to this day Mr. Chalmers has a strong milking strain in his herd. He raises good calves in his herd. He raises good calves without a nurse cow. This cow was of the "Honeysuckle" strain and proved to be a great breeder as well as mother. That same year Mr. Chalmers bought Millium, a daughter of Mignonette by 11th Duke of Gilliban, a bull that sired many of the good Shorthorns in the Ladd and Reed herd. He also purchased Woodlark, Imp. Weeping Willow's last calf; Rubia, Juniper and Bella Darling, all by Waterman, and Fair May Morning and Ocean Wave, by the 7th Earl of Darlington. Illustrious 5th of Locust Lawn, Red Bird 5th and 7th Duke's 2d Goodness, three Kentucky bred heifers, were purchased two years later from B. F. Winn of Missouri. In 1891 these were followed by Acton Rose, Mayflower 3d and Mildred 9th, purchased from J. and W. B. Watt of Ontario, Canada. The latter of these, an inbred Royal Sailor, proved to be a remarkable breeder and is the foundation of the Fork Branch Mildreds, so well known in the Chalmers herd. English Lady, another inbred Royal Sailor, was purchased from C. E. Ladd in 1903, but was bred by the Watt Brothers, referred to above. She is the dam of Mr. Chalmers' famous old breeding bull, Scottish Baron, and the Marquis, a bull of Mr. Chalmer's own breeding, is his sire. Margery, by Bapton Ensign, purchased from C. E. Ladd in 1908, is another great cow. Although a few bulls have been bought from time to time since then, these are the animals that appear in nearly all the Chalmer's pedigrees and have made the Fork Branch Herd famous.

When Scottish Flower 3d, a cow with a great show record, sold in the recent Pacific International sale, with a baby bull calf at foot, for $825, Fork Branch Mildred 13th for $510 and Mildred's Prince, one of his bulls, for $1000, Mr. Chalmers' line of breeding, his plan of mating and his holding on to his choice herd during hard times all seem to have been vindicated. He has during his breeding operations furnished foundation stock for a number of good herds and notable additions to others.

Glimpses of Life in the Open

Farming Development Throughout Northwest

(Continued from page twenty.)

Buckwheat grows well in the northwest and does not require particularly fine soil. Inquiry among the millers leads to the conculsion that there is not much market for buckwheat, and they are not inclined to build it up. They buy what is brought them, but do not ask for any and make no inquiries if none comes in, preferring, apparently, to buy in the east.

Some buckwheat has been grown in Marion county in the past. The accompanying picture was taken within a few miles of Woodburn, on the bottom lands. It shows buckwheat growing in a young peach orchard.

Returning to Mr. Reid's farm, in addition to a vineyard, there are several acres of logan berries and an apple orchard. The apple trees and their cousins, a row of quinces, perhaps offer the most valuable suggestions to other orchardists. A group of Newtown Pippins set four years ago has already come into bearing, and the color, texture and eating quality of the apples is proof positive that here is another variety which will do well on the Sound. The trees are standards, and were set in deeply prepared holes, the roots pruned and carefully spread out, and with a liberal feeding of bone meal to start the youngster to growing. Out of several hundred trees so set, not one failed to do well.
